succession became more and more divisive. More important, the realm suffered deepening internal disorder and devastating attacks from formidable external enemies, especially Viking and Saracen attacks by sea. When Louis died in 840, his three surviving sons—Lothair, Louis, and Charles—stood poised for an armed struggle over the disposition of the empire that led to the treaty of Verdun of 843. Little survived of the dream of a unified Christian society, a cause that had inspired some of the major achievements of the Carolingian dynasty. Although Louis was called "the Pious" for his advocacy of that ideal, some of his contemporaries and many later historians placed on him much of the blame for its failure.

Louis II, Emperor

Emperor Louis II (Ludwig, c. 825–875) became king of Italy in 839 (crowned 844) and joint emperor in 850. He was the son of Lothair I and the great-grandson of Charlemagne. Louis became sole emperor and received Italy as his share of Lothair's domains on the latter's death in 855. Although Louis did obtain Provence when one of his brothers, Charles, died in 869, he had little influence outside Italy. Engilberga (Ingelberga, Engelberta), his wife, could be considered Louis's coruler. Louis faced two major problems during his reign: the depredations of the Saracens, especially in southern Italy; and turbulent local warlords.

Louis was more successful in dealing with the Saracens, who by this time had seized Sicily from the Byzantines and had also established themselves in southern Italy, with a permanent base at the city of Bari. In 846, a Muslim fleet was defeated off the Italian coast near Naples, but they took revenge by falling on the Vatican (which was then outside the city walls of Rome) and sacking the basilica of Saint Peter, one of Christendom's holiest shrines. Even before his father's death, Louis had had some military experience against the Saracens. He continued to wage war against them throughout his reign, with considerable success in 866 and 867, but was unable to follow up because he did not have a fleet. As a result of an alliance with the Byzantine emperor, Basil I, a small Byzantine fleet was sent to assist Louis. Strains developed in the alliance, however; the fleet withdrew; and an engagement between Louis's daughter Ermengarde and Basil's son Leo was broken off. Basil sent an insulting letter to Louis, deprecating Louis's imperial title. Basil's letter is lost, but Louis's reply—which tells scholars much about western political theory during this period—has been preserved. Much of this reply was probably written for Louis by Anastasius, who was the papal librarian and a prominent intellectual. Despite the withdrawal of the Byzantines' naval support, Louis was eventually able to reconquer Bari in February 871.

Louis's dealings with the Italian nobility were less impressive. In particular, the Lombard rulers of the south solicited his aid against the Saracens, but they were never willing to concede much in return. In an embarrassing episode soon after Louis's triumph at Bari, his nominal

vassal, Adelchis, prince of Benevento, attacked and robbed him and imprisoned him for a month (August 871). Louis was released only after taking an oath never to return to the south. Well after Louis's death, the rebellious Italian nobles in the north and the south continued to be a problem for those trying to impose some centralized rule on the troubled peninsula.

Louis's relations with the popes were generally good, despite some friction when he championed his brother Lothar's divorce from Theutberga (Lothar wanted to marry his mistress, Waldrada). In 864, Louis marched on Rome to force Pope Nicholas I (r. 858–867) to assent to Lothar's divorce. The pope fled, but Louis fell ill. He took this as a sign from God that he was in the wrong, and was reconciled to Nicholas.

Historians have offered differing judgments of Louis II. Most agree that he and Engilberga had energy and ability but were overwhelmed by problems beyond their control. Their daughter Ermengarde eventually married Boso (or Bozo), who became king of Provence. Ermengarde and Boso's son was Louis III, "the Blind."

Louis the Blind, Emperor

Louis III (the Blind, c. 880–928) was king of Provence (890-928) and Holy Roman emperor (901-905). Through his mother, he was descended from Charlemagne. In 900, Louis was invited by disgruntled nobles led by Adalbert of Ivrea to wrest the Lombard throne from Berengar of Friuli. He was temporarily successful and was actually crowned emperor in Rome. Later, he was captured and released after promising never to return to Italy. Louis nonetheless tried again in 905, with the support of another Adalbert, the marquis of Tuscany; and Adalbert's wife, Bertha. Berengar fled to Bavaria but returned and exacted a terrible revenge on Louis, who was captured and blinded. After Louis's incapacitation, his cousin Hugh administered Provence for him. Hugh became king on Louis's death.

Lovato Dei Lovati

If relative success in imitating ancient Latin style and an intense interest in discovering and editing ancient texts are major humanistic traits, then Lovato (1240 or 1241-1309) was the first humanist. He was born in Padua, the son of a notary, *ser* Rolando or Rolandino Lovati. Lovato began his own notarial career as early as 1257, and ten years later he entered the Paduan college of judges, whose members were eligible to hold judgeships in the communal government. Deeply patriotic, the young Lovato doubtless joined other leaders of the city in an effort to reestablish the communal character of Paduan life, suppressed during the twenty-two-year tyranny of Ezzelino da Romano, who was killed in 1259. From 1271 until 1307, Lovato held a number of judicial appointments, and on at least one occasion he served as *podestà* of a neighboring commune. As *podestà* of Vicenza in 1291-1292, he commissioned historical frescoes for the walls of its communal palace. He married Jacopina di Vincenzo da Solesino (c. 1268) and had at least one child.

Nothing is known of his schooling. The Paduan university, dosed by Ezzelino in 1237, did not reopen until 1261. Possibly Lovato studied privately with Rolandino da Padua, who was the learned author of a renowned history of Padua and a professor of grammar in the newly revived university, though no evidence exists to support the assumption. However, the richly allusive content and classicizing style of Lovato's earliest surviving poetry (1267-1268) reflect a thorough preparation in Latin grammar and poetic literature.

Northern and central Italy, which would be the site of later Italian humanism, produced almost no Latin poetry during the twelfth century,

except for a few Latin epics such as the *Gesta di Federigo I in Italia* and, in the very last decade, the *Elegia* of Arrigo (Henry) da Settimello. Interest in ancient Latin literature, however, increased significantly in the first half of the thirteenth century; and in the middle decades of the century it inspired a number of poets in the northern cities who looked to ancient poetry as models. Lovato was the youngest, but without question the most successful, classicizing writer of the group. In particular, his epistolary poems, written between 1267–1268 and 1291–1292, embody a lyric quality foreign to previous poetry of the area and resonant of Ovid and Horace. A second, later body of poetry by Lovato—largely poems on contemporary issues and a debate over the merits of having children—is less classicizing in nature, perhaps because there were no ancient models for these genres. Among Lovato's writings are a lost poem on the Guelfs and Ghibellines at Padua and a Latin version of the story of Tristan and Isold, of which only fourteen lines survive. In his prose—in contrast with his poetry—Lovato seems to have made no effort to adapt his style to ancient models.

Tomb of Anterior, legendary founder of Padua Lovato "discovered" his remains and had them enshrined here. Lovato is buried next to this tomb. Photograph courtesy of Christopher Kleinhenz.

Lovato's poetry reflects an acquaintance with a wide range of ancient poets—some of them little known or unknown in the Middle Ages—such as Tibullus, Propertius, Lucretius, and Martial. Lovato also reintroduced Ovid's *Ibis*, Statius's *Silvae*, and Horace's *Carmina*. His manuscript of Seneca's *Tragedies* served as the fundamental text in the revival of those works, and his little essay on Seneca's complicated

metric scheme in the plays was perhaps the first instance in the Middle Ages of an attempt to work out the meters used by a specific ancient author.

By Lovato's last years, Padua had become the center of a classicizing movement which found adherents in other cities of the Veneto, such as Pace da Ferrara and Benvenuto Campesani of Vicenza. Furthermore, as the enthusiasm for the new studies expanded during the next generation to Venice, Bologna, Arezzo, and distant Avignon, Albertino Mussato (1265-1329)—Lovato's principal disciple—continued to sustain Paduan leadership. Significantly, Lovato was the only European Latin poet since antiquity to receive Petrarch's praise.

Lucan

Marcus Annaeus Lucan (a.d. 39-65), a nephew of the younger Seneca, was born in Cordoba, Spain. After a Stoic education in Rome, he entered the court of Nero, where he was valued as a member of the emperor's inner circle. Lucan enjoyed many privileges at court; but for reasons that remain unknown—literary jealousy on Nero's part? the republican ideas expressed in Lucan's work?—his relationship with

Nero abruptly soured. Lucan joined the conspiracy of Piso against the emperor, was discovered, and was ordered to take his own life. In April 65 he killed himself. He was not yet twenty-six.

The only work of Lucan's to survive, *Pharsalia* (also known as *Bellum civile*, the title found in ancient biographies of Lucan), is an epic poem in ten books of hexameters which was left unfinished at his death. The epic narrates the history of the civil war between Caesar and Pompey, and in so doing glorifies the ideals of ancient republican liberty. *Pharsalia* also introduced several controversial innovations to the epic genre: Lucan's epigrammatic style resembles oratory, his annalistic approach to narrative resembles history, and his plot's rejection of divine intervention disregards epic precedent by declining to displace responsibility for the events of the conflict. Perhaps most important, Lucan's poem violates epic convention by refusing to exalt the state and its military victories. Rather, *Pharsalia* roundly condemns civil war and denounces the moral indignities that accompanied Caesar's triumph and the new regime.

Lucan's popularity was ensured from early on. Beginning with Servius, Lucan's work was cited frequently by grammarians. It was copied in hundreds of manuscripts and was the subject of several long medieval commentaries. Valued as a repository of Roman history, geography, and natural science, *Pharsalia* was a fixture in medieval school curricula. Its use of epigrams and the rhetorical pathos of Lucan's narrative were of stylistic interest to the Middle Ages, and its digression into necromancy in Book 6 appealed to the medieval interest in witchcraft.

Lucan's work was translated into Italian as early as 1310 and enjoyed steady popularity throughout the *Trecento*. Lucan was very well known to Dante, who included him among the five great poets of the *bella scold* in *Inferno* 4 and ensconced him in the literary canon in *Convivio* and *De vulgari eloquentia*. Dante's treatment of Lucan makes it clear that, despite his dependence on *Pharsalia* for many of his historical allusions, he considered Lucan a poet rather than a historian. Examples of Dante's debt to Lucan include his portrait of Cato in *Purgatorio* 1, his list of serpents in *Inferno* 24, and his references to Erichtho and Antaeus in *Inferno* 9 and *Inferno* 31, respectively. Petrarch, too, was indebted to Lucan; many episodes in his *Africa* owe their inspiration to the

Lucca

The Tuscan city of Lucca is situated at an altitude of only about 60 feet (19 meters) above sea level, some 15 miles (23 kilometers) from the coast and about the same distance from Pisa, with Florence about 45 miles (72 kilometers) to the east. It lies on the left bank of the Serchio River, which flows down from the mountainous Garfagnana to the north, in a fertile plain about 5 miles (7 or 8 kilometers) wide between the Pizzorne to the north and the Monte Pisano to the south.

The origins of Lucca are obscure, but archaeological evidence suggests that it began as a Ligurian settlement on the frontiers of Etruscan territory. It was first mentioned by Livy under the year 218 B.C. and was a Roman *colonia* in 180 B.C. and a *municipium* in 90–89 B.C. The first triumvirate was formed at the conference of Lucca in 56 B.C. Roman Lucca had baths, a forum, a theater within the walls, and an amphitheater outside them, built in the second century after Christ. Although Lucca was less important than the neighboring ports of Pisa and Luni or the regional capital, Florence, its territory extended to the province of Reggio, and arms manufacturing on some scale took place in Lucca during the fourth century after Christ.

The situation of Lucca under the Ostrogoths is obscure, but the Byzantines' attempts at reconquest met with strong resistance: Lucca held out for more than three months when it was besieged by Narses in 552. Restored Byzantine rule was short-lived, and the city had probably fallen to the Lombards by 570. There is more information for the Lombard period, thanks to a remarkably rich collection of early charters, some of them dating back to the seventh century, preserved in the ecclesiastical archives. Lucca seems to have prospered under the Lombards, as the center of the most important of the Lombard duchies in Tuscany, the seat of a royal palace, and a mint. The Lombard element in the population, including an upper class with large rural estates, remained important even after the establishment of Carolingian rule in the second half of the eighth century.

Little is known of the introduction of Christianity into Lucca, but a certain Maximus a Tuscia de Luca was among the bishops attending the council of Sardica in 343–344. It is difficult to date figures important in Lucchese legends, such as Paulinus, who is said to have been the first bishop and a martyr; or Frediano, who is credited with having diverted the Serchio away from Lucca by miraculous means, giving it an outlet to the sea separate from that of the Arno. Frediano is said to have been of Irish origin, and the traditional date for his death is 588, but scholarly opinion differs on whether he should be regarded as belonging to the Ostrogothic or Lombard period. The Lombards were at first Arian, and Lombard Lucca had Arian clergy, and perhaps bishops, as well as Catholic clergy; but after the Lombards were converted to Catholicism at the end of the seventh century, many churches were founded in Lucca and its territory, and churchmen seem to have been powerful in local affairs.

During the rule of the Carolingians, and later the Ottonians and Salians, Lucca came under the authority of local lay rulers, especially the marquesses of Tuscany. The most important of these were Boniface of Canossa and, after his death in 1052, his widow Beatrice and his daughter, best-known as Matilda, countess of Tuscany. In northern Italy, this period saw the general beginnings of the movement for reform of the church and the struggle between empire and papacy, as well the first stirrings of local initiatives and a sense of common interests, which were eventually to lead to the rise of the commune. In Lucca, as elsewhere, these different strands became intermingled.

Anselm da Baggio, who was bishop of Lucca from 1057 (later Pope Alexander II, r. 1061–1073), and his nephew and successor as bishop, Anselm II, strove to bring about a movement of moral, spiritual, and cultural revival; they were supported by Beatrice and later Matilda of Tuscany, but they were opposed by many of the Lucchese clergy and local inhabitants, who had the support of Emperor Henry IV. It was in this context that the Lucchese received an imperial privilege granting them special rights over an area extending 6 miles (10 kilometers) from the city and freedom of navigation on the Serchio River and along the coastline off Motrone. In 1119 the characteristic office of the early commune, the consulship, made its appearance, and there is evidence that Lucca already had major and minor councils by 1124.

In the twelfth century, Lucca was able to grow and increase the area over which it exercised control. In 1160, the last of the marquesses of Tuscany, Duke Guelf, ceded his rights over the city (and the 6 miles around it) in return for a large sum of money. Lucca was still under imperial authority and had to supply forces for military operations under Frederick I Barbarossa, but it also received imperial favors, such as the confirmation of the grant of Duke Guelf, the right to elect its own consuls, and a grant of exclusive minting rights. Imperial grants were still limited to a radius of 6 miles from the city, and local lords were confirmed as directly dependent on the empire, any submissions they had made to the commune being canceled. On the death of Henry VI in 1197, Lucca joined the first Tuscan League and was able to take advantage of the weakness of the empire to extend its control over a wider area, although this involved it in conflict with Pope Gregory IX regarding rival claims to the Garfagnana. This expansion was checked to some extent under Frederick II Hohenstaufen. The mid-thirteenth century saw Lucca in alliance with Florence, opposing Manfred, king of Sicily, and in 1266 supporting Charles of Anjou and what came to be known as the Guelf alliance in Tuscany. This brought Lucca prosperity and territorial gains, but in the last years of the century Lucca fell prey to factions, with the Blacks eventually defeating the Whites. A popular party came to power in 1308. The disorders and political corruption of this period were condemned by Dante and by the local chronicler Giovanni Sercambi, who names Bonturo Dati, Picchio Cacciaiuolo, and Ceccho dell'Erro; but Lucchese sources for this period are too fragmentary to provide a clear picture of the city's political life.

Cathedral of San Martino, Lucca. Photograph courtesy of Christopher Kleinhenz.

Long before this, Lucca had begun to come into conflict with other communes, fighting a war with nearby Pisa as early as 1004. These rivalries became more serious as both cities sought to extend their authority over the surrounding rural area, resulting in a series of conflicts over territorial and navigational rights. In these instances

Lucca could usually rely on the support of another rival of Pisa, the more distant commune of Genoa; in the thirteenth century, it could rely on the support of Florence.

Lucca's internal development mirrored that of other communes. The first *podestà* was elected in 1188 or 1189, and this office gradually replaced that of consul. At first, Lucchese were sometimes elected, but after 1228 the *podestà* was invariably from outside the city. Conflicts between nobles and the people are recorded in the early thirteenth century, and in 1261 the offices of captain of the people and *anziani* (elders) make their appearance, though it seems likely that they had been established soon after 1250, on the model of Florence. The full constitutional development of Lucca is seen most clearly in the statute of the commune of 1308, which was compiled shortly after the popular victory. It reveals a highly developed form of government with *podestà*, *anziani*, councils, and a full apparatus of civil and criminal jurisdiction.

Church of San Michele in Foro, Lucca. Photograph courtesy of Christopher Kleinhenz.

Soon afterward, Lucca began to face serious problems. First came the Italian expedition of Emperor Henry VII, who threatened the hold of Italian communes on the territory in the *contado* (countryside), which Lucca had usurped without any imperial grant. Lucca also had to face the enmity of Pisa, which hoped to take advantage of imperial authority

to recover recent territorial losses. On Henry's death in 1313, Pisa found another champion in Uguccione della Faggiuola, a Ghibelline leader from the Massa Trabaia who had been the emperor's lieutenant in Genoa. Uguccione attempted both to strengthen his hold on Pisa and to expand the area under his control—campaigns that, with the aid of Lucchese White exiles, including Castruccio Castracani, culminated in the capture and sack of Lucca on 14 June 1314. Further expansion in Valdarno and Valdinevole was opposed by Florence, but in 1315 Uguccione and his forces won a major victory over the Florentines and their Neapolitan allies at Montecatini. In 1316 Uguccione lost control of Lucca to Castruccio, and Pisa regained its independence. Lucca reached its maximum territorial expansion and the height of its power under Castruccio, a vigorous warrior and wily diplomat whose achievements later attracted the admiration of Machiavelli. In 1325 Castruccio obtained the submission of Pistoia and defeated the Florentines and their allies at Altopascio. Lewis (Ludwig) of Bavaria, the emperor-elect, granted him the title of duke of Lucca, Pistoia, and other territories, and in return Castruccio played a prominent role at the imperial coronation ceremonies in Rome in 1328. Hastening back to Tuscany, where Pistoia had fallen to the Florentines, Castruccio succeeded in repelling his enemy and recovering control of the city, but he died soon afterward.

Lucca soon paid for its period of military glory under Castruccio, because his young sons were unable to retain his dominions. Over the next fourteen years the city fell into the hands of a series of outside rulers, including Gherardo Spinola da Lucolo, the Rossi brothers of Parma, and Mastino della Scala, who sold Lucca to Florence. But Lucca was already under siege by the Pisans, who forced its surrender in July 1342, thus beginning a twenty-seven-year period of Pisan rule. Although Lucca was allowed a measure of autonomy, its subjection incurred the presence of a Pisan garrison and Pisan control of Lucchese finances and external relations. The Lucchese never ceased to hope for the overthrow of Pisan rule, and finally, in 1369, they succeeded in inducing Emperor Charles IV to grant them independence. Lucca once more assumed its identity as an independent commune, and Lucchese sources from this period exude a sense of a new beginning. It was to prove decisive. Despite internal difficulties and further territorial losses, Lucca retained its independence until the time of Napoleon.

Lucca's economic life in the early Middle Ages was based on the rich agricultural land in the surrounding area and its position on Via Francigena, one of the main communication routes between Rome and northern Italy. Although the Serchio was subject to severe flooding, the Lucchese plain provided rich grain growing land. Vines and olives were cultivated on slightly higher land, and the lakes and woods were rich in fish and game. The mountainous Garfagnana provided pasture for sheep and goats and also timber. Fourteenth-century customs accounts indicate that timber—including ships' masts—was floated down the Serchio, and tens of thousands of transhumant animals passed through Lucchese territory.

Travelers and pilgrims were attracted to Lucca because of its position on Via Francigena and its possession of the Volto Santo ("holy visage" or "holy face"), a miraculous crucifix. Money changers set themselves up to serve the needs of pilgrims and travelers; their operations were concentrated in the area in front of the cathedral of San Martino. The oath required of money changers and spice dealers who operated there, dated 1111, can still be seen on the cathedral facade. It was probably sometime in the twelfth century that the manufacture of silk cloth, which would become Lucca's most important industry during the Middle Ages, began to develop. Lucca's role in silk manufacturing is somewhat surprising. Lucca did not apparently cultivate silk itself. The raw materials had to be imported, coming from as far away as the eastern Mediterranean, the Caspian Sea, and even Cathay. Lucca was not a coastal city, and although it had access to the sea, it never developed an important merchant fleet, so that it had to rely on other ports, especially Genoa, for the supply of raw materials. The traditional explanation for the establishment of silk manufacture in Lucca is the immigration of Arab silk workers from Sicily during the years 1148–1150: the names and designs of some of the types of cloth clearly suggest Arab influence. But whatever its origins, the silk industry in Lucca reached the height of its development in the thirteenth century.

This early development of money changing and silk manufacturing encouraged the Lucchese to engage in commerce, to the point that they became prominent among Italian merchants in northern Europe. The Lucchese had had the right to navigate the Serchio River and the seacoast near the port of Motrone since 1081, and treaties with Genoa

in 1126 and 1166 included commercial clauses. In 1181 the Lucchese engaged in a commercial treaty with Pisa for port rights there, as they did with Modena and Bologna, visiting the fairs of Parma and San Donnino free of tolls and taxes.

The greater availability of documentation in the thirteenth century, including the earliest Lucchese notarial records, makes it possible to speak with more certainty about Lucchese commercial and financial activities. Such activities were particularly significant in Genoa, both in commerce and in financial transactions connected with the fairs of Champagne. Lucchese traded at the fairs from the beginning of the thirteenth century, if not before, and were among the earliest Italian merchants to appear there. By the mid-thirteenth century they were sufficiently numerous to rent property in Provins jointly. Documents record their appearance at fairs in southern France—in Nîmes, Beaucaire, and Montpellier as well as in Marseilles and other parts of Provence—by the 1260s and 1270s. Their activities spread to Paris and northern France, the Low Countries, and the Rhineland, and they were active in England, Ireland, and Gascony under Henry III and Edward I, combining the collection and transfer of papal taxes with the import of Mediterranean goods and the export of northern wool and cloth. By the last decades of the century, Lucchese merchants and bankers were forming themselves into companies, and some of their members settled in Paris or London for a period of years, if not permanently, sometimes claiming rights of citizenship. They not only engaged in commerce and the supply of luxury goods to the court and nobility but also involved themselves in loan operations and royal finance, at times controlling the royal mint and administering the customs system. The dangers involved in this are shown by the fate of the largest of these companies, the Ricciardi, which collapsed when it was caught between the demands of the papacy, Philip IV, and Edward I after war broke out between France and England in 1294.

At the same time, there were economic difficulties in Lucca itself. Social and political disturbances repeatedly led to waves of emigration of merchants and silk workers. This resulted in the exportation of skills and trade secrets to Bologna, Genoa, Florence, and Venice, although there may have been some revival of economic activity under the strong rule of Castruccio Castracani and after some of the immigrants

later returned under amnesty. Later invasions and wars combined with famines and the outbreak of plague in 1348 led to serious depopulation both in the city and in the surrounding *contado*. The earliest fragments of Lucchese customs accounts—for 1339 and 1351—show that silk exports were still sizable, but they fell off sharply in the late fourteenth century and the early fifteenth, despite significant immigration of craftsmen of various kinds, including silk workers, in the second half of the fourteenth century. By the 1380s the Lucchese were promoting the manufacture of woolen cloth to compensate for the decline of the silk industry. For much of the fourteenth century, Lucchese trading companies seem to have been small, but after 1369 there were also a number of companies with ten or more members, and branches had appeared in various European cities. Lucca also had organized communities abroad, capable of disciplining their members and pursuing a deliberate commercial policy, as well as providing financial and political support. Several Lucchese companies—such as the Guinigi, the Rapondi, and the Forteguerra—were of importance in Europe generally, acting as papal bankers and suppliers to the courts of France and Burgundy in the late fourteenth century and the early fifteenth century.

Cultural activity in Lucca developed as early as the eighth century. An inscription of 767 records a school near the cathedral, one of whose masters, Deusdedit, subscribed to documents, and there was probably a scriptorium connected to the cathedral. A surviving manuscript, Codex 490 of the Biblioteca Capitolare, dates from the late eighth or early ninth century. This large composite work was written by forty or more different but related hands, which also show Visigothic and Irish influences. The manuscript includes a pen-and-wash drawing of the Good Shepherd, and one section of the manuscript provides instructions for preparing parchment, writing in gold pigment, and manufacturing various colors. The manuscript was not a luxury item but intended for use, and it seems to indicate an active scriptorium in Lucca itself. Large numbers of charters surviving from as early as the eighth and ninth centuries would also indicate the presence of scribes in Lucca.

The cathedral of Lucca also became the location of the Volto Santo ("holy face"), a carved wooden crucifix bearing a more than life-size

figure of Christ dressed in a *colobium*, or sleeved tunic. The Volto Santo has been much discussed, because according to tradition it arrived in Lucca in the mid-eighth century whereas stylistic analogues place it no earlier than the twelfth or early thirteenth century. The legendary account given by Deacon Leboin stresses its miraculous properties and the claim that the figure was carved by Nicodemus and represented a real likeness of Christ. However that may be, there is historical evidence of the veneration of the Volto Santo as early as the late eleventh century: William II of England (d. 1100) is recorded as swearing by the "Holy Face of Lucca." There is good reason to believe that the present Volto Santo was substituted for the original image at some subsequent date.

The Volto Santo was to be of the greatest importance for Lucca's religious, artistic, economic, and political development. The feast of the Holy Cross (Santa Croce) on 14 September became the main local festival, and eventually the emblem of the commune—as well as of the Christian faith. The Volto Santo was portrayed on Lucchese coinage; villages of the Lucchese *contado* were obliged to send representatives to offer candles in the Santa Croce procession; and when Lucchese merchants established trading colonies abroad, these included a chapel dedicated to the Volto Santo.

The spiritual and economic revival of the eleventh and twelfth centuries was accompanied by an upsurge in both ecclesiastical and secular building. A new circle of walls was begun in the eleventh century, though it was not completed until the late twelfth century. Towers and tower-houses were also built, but this was above all a period of church building. Santa Maria Corteorlandini was begun in 1188, and San Michele in Foro belongs to the same period; Santa Maria Forisportam was built a little later. The rebuilding of the cathedral of San Martino was begun under Anselm da Baggio, and the facade was completed by the sculptor Guidetto da Como in 1204. The bishop's palace was completed in 1224. The establishment of the mendicant orders in Lucca brought new forms of religious devotion and gave a new impulse to ecclesiastical architecture. The Dominican church of San Romano was consecrated in 1281, although building work continued on other parts of the convent. The Dominican theologian and author of the *Annals*, Tolomeo Fiadoni (Ptolemy of Lucca), taught there in 1287 and

was the prior in 1288. Work was also proceeding on other Lucchese churches, such as Santa Maria Forisportam and Santi Simone e Giuda.

The cathedral of San Martino was also a cultural center, with a cathedral school that is frequently mentioned in eleventh- and twelfth-century documents and a scriptorium that produced at least some of the finely written and illuminated manuscripts mentioned in documents or surviving in Lucchese collections, although there is also evidence of ownership of manuscripts produced in other traditions. Some of these manuscripts had precious bindings with silver or gilt clasps. There is much evidence of goldsmiths active in Lucca in this period, producing church plate, altar furnishings, and sacred ornaments.

A group of citizens with literary interests emerged in the thirteenth and fourteenth centuries. The earliest distinctive literary personality is Bonagiunta Orbicciani, best-known for his appearance in Canto 24 of Dante's *Purgatorio*. In the fourteenth century, sources such as wills and letters indicate an interest in the acquisition and exchange of books among a wider group of citizens. Most of these books were connected with their professional activities as doctors and lawyers, but there was also an interest in classical and contemporary literature. The best-known Lucchese poet of the fourteenth century was *ser* Pietro Faitinelli, a notary and civic official whose political activities led to a period of exile. It was during his exile that he produced some of his most moving poetry. Giovanni Sercambi was an apothecary who combined business activities with political involvement as a supporter of the Guinigi, while also writing a collection of *novelle* and compiling a chronicle (*Croniche*). His chronicle is the most important source for the political history of fourteenth-century and early fifteenth-century Lucca—as well as a vehicle for his intensely personal opinions and prejudices.

The tradition of painting in Lucca can be traced from the thirteenth century, when Berlinghiero Berlinghieri (c. 1180-c. 1236) and his sons Barone, Bonaventura, and Marco were active. Berlinghiero's origins and artistic affinities are uncertain—documentation is sparse, and there are difficulties in the attribution of surviving works—but a large painted crucifix (now in the Museo di Villa Guinigi in Lucca) bears an inscription recording Berlinghiero as the painter. A similar inscription identifies his son Bonaventura as the artist who painted the Saint Francis panel in the church of San Francesco in Pescia in 1235. Barone

worked as a panel painter, and Marco is recorded as an illuminator of manuscripts and was active in Bologna as a fresco painter in the 1250s. The artistic tradition in Lucca may at first have been dominated by Christocentric devotion connected to the Volto Santo, but in the second half of the thirteenth century the foundation of a number of chapels testifies to the spread of the cult of the Virgin Mary, perhaps under the impulse of the Dominicans and other mendicant orders. The most prominent painter in Lucca in the late thirteenth century and the early fourteenth was Deodato Orlandi, whose works include depictions of the Madonna and child with saints, as well as painted crosses.

The political divisions and disorders of Lucca in the first half of the fourteenth century may have discouraged major artistic commissions, although fortification projects and extensive renovation of private houses and churches in the city and *contado* continued unabated. The evidence of wills, especially after the black death in 1348, indicates that family tombs and chapels were built and that Marian devotion increased. Laymen, especially of the Lucchese merchant classes, were the main patrons of art during this period. Private commissions for tombs, altarpieces, frescoes, and church ornaments were frequent, whereas commissions from churches or monasteries were relatively few.

A number of Lucchese masters are documented in these decades, but most seem to have operated at a modest level and few emerge as distinctive artistic personalities. The most significant painter is Paoluccio Lazzarini, who had come into contact with the work of Florentine and, probably, Sienese artists while in exile with his father, also a painter, between 1314 and 1334. Paoluccio is first mentioned as an artist in 1341 and was the most active Lucchese painter of the mid-fourteenth century. His works included frescoes for the chapel of the *anziani* and an altarpiece for Santa Maria dei Servi, but he was often involved in disputes and was occasionally reduced to making designs for silk cloth. The recovery of Lucca's liberty in 1369 brought him greater professional opportunities and enabled him to carry out many important commissions for the commune and for private patrons until his death in 1385.

By this time there were other significant painters in Lucca, such as Angelo Puccinelli and Francesco Anguilla. Angelo Puccinelli, documented from 1379 to 1407, carried out important commissions for

highly placed patrons and left a number of signed works. Francesco Anguilla, documented from 1384, engaged in all aspects of painting from designs for silks to decorating tabernacles and altarpieces, a number of which can be identified as his work. His long career, which lasted until 1444, connects medieval painting in Lucca with the developments of the early Renaissance.

Lucretius

I here are only sketchy details on the life of the Roman poet Lucretius (Titus Lucretius Carus, after 90-middle 50s B.C.). His birthplace and social class are unknown. Jerome records that Lucretius was driven to madness by a love potion, but there is no evidence that Lucretius was insane, and it is likely that this claim was first made by Christians in an effort to undermine Lucretius's polemic against religion.

Lucretius's masterpiece, *De rerum natura* (*On the Nature of Things*), is a poem in six books of hexameters that sets forth the basic principles of Epicurean physics, anthropology, and cosmology. According to Epicurus and Lucretius, all things and beings consist of an aggregate of atoms joined together in different ways. This aggregate includes the soul, which naturally breaks down when the atoms that formed it disintegrate. Human knowledge of the soul's mortality thus makes religion unnecessary and potentially oppressive. Such assertions, which questioned the value of religious belief, proved to be controversial and consequently impeded the transmission of *De rerum natura* to the Middle Ages.

The text of Lucretius's poem was quoted by Isidore of Seville, was copied by scribes at Charlemagne's court, and was used by Hrabanus Maurus; but then it virtually disappeared from view until 1417. Although there are a few references to the poem in library catalogs and an Italian *florilegium* contains a line from Lucretius's work, *De rerum natura* seems to have been unknown to medieval readers. The protohumanist Lovato Lovati is sometimes said to have known of Lucretius, but the evidence is scant. Dante was not acquainted with Lucretius's poem, though his unfavorable opinion of Epicurean philosophy is attested to in *Infemo* 10, where Epicurus and the Epicureans are punished for their belief in the mortality of the soul, and by several passages in *Convivio*, where Epicureanism is explicitly

condemned.

M

Macrobius

The identity of Macrobius (fl. 400-425) is disputed. Although not a Roman by birthplace, he lived in Rome and received a good education by the standards of his time. His two major works—written for the education of his son, Eustathius—were *Saturnalia* and *Commentary on the Dream of Scipio*. These had the greatest influence in the Middle Ages and Renaissance, although one or two other writings have also been attributed to Macrobius. Macrobius's thought is based on Platonic philosophy and cosmology; he also was recognized as an authority on the virtues.

The *Saturnalia* has not survived in its entirety. All extant manuscripts derive from a single codex of the late eighth or early ninth century. Today the work is divided into seven books that constitute a symposium or banquet; that is, the *Saturnalia* purports to relate how a gathering of learned men celebrated in seemly fashion the three-day feast of the Saturnalia by discussing learned or entertaining features of Virgil's life, knowledge, and poetry. Virgil is esteemed by almost every celebrant as a master of all knowledge; his *Aeneid* is itself viewed as a kind of sacred poem deserving admiration and understanding. Various topics are chosen for discussion and debate during the gathering. On the first day, the men take up different Roman institutions such as the Saturnalian feast itself, the calendar, and religion; these subjects are followed, in the afternoon, by striking sayings from antiquity and, later, topics such as wine and pleasure (Books 1 and 2). On the second day, they take up philosophical and astronomical topics and legal institutions, then commentary on civilization, and finally the quality of different fruits (Book 3). On the third and last day, there is discussion of Virgil as an artist, and especially as a rhetorician and a consummate imitator of Homer and other Greek and Latin antecedents; this section includes extensive quotations from, and cross-references to, Virgil's

three masterpieces: the *Aeneid*, *Bucolics*, and *Georgics* (Books 4, 5, and 6). The last book treats scientific and medical matters. The *Saturnalia* therefore illustrates what was of interest to educated, civilized Romans in Macrobius's time.

The *Commentary on the Dream of Scipio* survives complete. Its two books contain extensive commentary on scientific and philosophical topics suggested by Cicero's account of Scipio's dream of his elevation to the heavens after death. The most influential part of the *Commentary* is found at the beginning. Here Macrobius discusses the uses of fables (*narratio fabulosa*) in philosophical discourse and the distinction between true and false dreams. Philosophical fables are allegories in which the myth covers a truth about divinity, science, or morality. Among the allegories are dreams, which Macrobius classifies as true or false prophecies (he categorizes them according to mode). The most important are enigmatic dreams that may be true (*somnam*) or false (*insomnium*), as in wish-fulfillment dreams or nightmares. The *visum* shows the dreamer what will actually happen, and the *oraculum* has someone tell him or her of future events. However, if what is seen or foretold in the dream is false, it is termed a *visio*. These definitions serve as an introduction to Cicero's text, the fictional account of a dream. The commentary that follows draws its abundant philosophical and scientific information from Platonic cosmology.

The *Saturnalia* and the *Commentary* were widely disseminated during the Middle Ages, although their relative influence varied, if we can judge by the dates and numbers of manuscripts that survive from different periods. Both served as encyclopedic sources in Platonic and Neoplatonic philosophy and cosmogony. The influence of the *Commentary* reached a high point in the twelfth and thirteenth centuries, whereas the *Saturnalia* came into its own in the late medieval period and the Renaissance. This is not to say, however, that both were not widely known and used in all periods. In Italy, Macrobius influenced Boccaccio, Petrarch, and probably Dante, among others. Moreover, the discussion in *Saturnalia* concerning Virgil's art fit medieval ideas on literary composition and interpretation, especially in the art of invention and rewriting of antecedent sources. Such rewriting could be original. The way Virgil is said to imitate and allude to his Greek and Latin antecedents might well have influenced Dante's

rewriting of his master Virgil in the *Divine Comedy*. The representation of his universe might well have been influenced by cosmogonies like that in Macrobius's *Commentary*.

Madrid Scylitzes

One of the most richly illustrated of all surviving medieval Greek secular manuscripts was produced not in the territory of the eastern Roman (Byzantine) empire, but rather in Sicily during its period of Norman rule. This is the so-called Madrid Scylitzes (Biblioteca Nacional de Madrid, Vitr. 26—2). The 574 miniatures on its remaining 226 folios constitute an exceptionally valuable resource because they depict actual objects, such as articles of clothing, boats, tents, and military weapons, and also because to testify to societal attitudes and practices in the Greek cultural area that long included parts of southern Italy. These illuminations, illustrating a large-format parchment copy of the eleventh-century chronicle *Synopsis historiôn* of John Scylitzes, are executed in several styles, some traditionally Byzantine and others showing variations consonant with the ethnic diversity of the Sicilian kingdom. To what extent (if any) the artists followed a model available to them has been a subject of debate.

The manuscript itself is now usually dated to the mid-twelfth century, but according to other hypotheses, arising in part from the activities of one of its scribes, it was slightly later (1170s) or earlier (1130s or 1140s). Scholars also differ in locating its physical production: in the capital, Palermo, or Greek-dominated Messina. The sumptuousness of its illustrations, and their abundance—actual and intended (some spaces for illustrations have been left blank)—support

the general view that the book was commissioned by the royal court. It has also been suggested that the patron may have been one of the kingdom's wealthy secular Greeks. The miniatures are historically significant in their own right, and some are also stylistic precursors of those in another famous Sicilian manuscript, the unique copy (c. 1196) of Peter of Eboli's *Liber ad honorem Augusti*.

Madrigal

The madrigal—a short lyric form of popular origin that treats pastoral and amorous themes—appeared first in fourteenth-century Italy and later spread to France and Spain. A madrigal consists of a group of two to five tercets followed by a couplet. The prevalent meter of madrigals is the hendecasyllable, although there are madrigals consisting of a mixture of hendecasyllable and *settenari* (seven-syllable verses). Most fourteenth century madrigals have a tripartite structure consisting of two tercets and a couplet of hendecasyllables that correspond, respectively, to the introduction, development, and conclusion of a

theme. Although the verses of the tercets admit of various combinations of rhyme, those of the couplet, or "coda," are usually in *rima baciata*. The following are the most common rhyme schemes: (1) ABC ABC DD, (2) ABA BCB CC, (3) ABB CDD EE, (4) ABA CDC DE DE, (5) ABB ACC DD, (6) ABA CBD EFF GG, and (7) ABB CDD EE FF. There are also madrigals consisting only of tercets, and others that have *terzetti rinterzati* as in Franco Sacchetti's *Passato ha 'l sol tutti i celesti segni* (ABCC DEFF GG).

Little is known about the origins of the madrigal, but there are hypotheses, which are reflected in theories of the etymology of the word "madrigal." At various times during the *Trecento* the madrigal was known as *mandrialis*, *madriale*, *mariale*, *marigale*, *materialis*, *matricalis*, and *metricalis*. In his treatise on poetry, *Summa artis rithimici vulgaris dictaminis* (1332), Antonio da Tempo states that *mandrialis* derives from *mandra* (flock) and was a shepherds' song. Pietro Bembo (1525) also underscored the madrigal's pastoral origin and referred to its rustic subject matter (*cose materiali e grosse*) and style (*si cantassero in quella maniera di rime, sciolta e materiale altresì*). According to one popular etymology, *madrigale* derives from *matricalis* or "maternal" song; according to another, *mariale* refers to *matrimoniale* or "wedding" song.

Whatever its etymology, and whenever it first appeared in Italian literature, the madrigal was taken up by numerous poets of the *Trecento*. Petrarch's four madrigals—included in *Canzoniere* (52, 54, 106, 121)—are among the finest of the period, followed by those of Franco Sacchetti, Niccolò Soldanieri, Alesso di Guido Donati, and Cino Rinuccini. Many *Trecento* madrigals were set to polyphonic music by the musicians of the *ars nova*, such as Francesco Landini, Jacopo da Bologna, Gherardello da Firenze, Lorenzo Masini, and Donato da Cascia, and are contained in the musical anthologies of the period, the most renowned of which is the Squarcialupi Codex of the Biblioteca Mediceo-Laurenziana in Florence. Hence, the madrigal owes much of its development as a high art form to the *ars nova*.

During the *Cinquecento* and the *Seicento*, the Petrarchan or *Trecento* model of the madrigal was replaced by a more open form dealing with a variety of themes. At this point, the madrigal was primarily a musical form, although Michelangelo, Tasso, Guarini, and Marino used this lyric

form. In the nineteenth century, Giosuè Carducci, Severino Ferrari, and Gabriele D'Annunzio attempted to revive it, but with little success.

Today, scholars continue to debate whether the madrigal is a literary or musical form. Musicologists have emphasized the need to study the relationship between its literary and musical features. Although the madrigal is often considered an instance of *poesia per musica*, documentary evidence suggests that it also existed as an independent literary form. The numerous literary anthologies of the *Trecento* and *Quattrocento* containing madrigals and *ballate* should suggest to contemporary literary historians and musicologists that it was probably enjoyed as poetry, and not only as *poesia per musica*.

Maestro Francesco

The poet Maestro Francesco (fl. 1200s) is identifiable only as the author of a *canzonetta*, six sonnets, and one double sonnet, gathered in manuscript Vatican Latino 3793 according to the codex's system of separating *canzoni* from sonnets and ballads. His works reflect the influence of Sicilian and Occitan courtly themes, such as the rewards of *buon servire* and of the patient tolerance of love's torment (*la speranza / . . . fami essere soferente*) and a woman's obduracy (. . . *che soferenza / è d'orgoglio medicina* in *De legrevi doglie*). Other sonnets address typical courtly motifs, such as a beloved's departure and the consequent abandonment of life and pleasure (*lo gioco perdone e la vita* in *Lo vostro partimento*), as well as the question of the divine nature of love (*c'amor sia deo non è la veritate*). Yet the sonnet *Se non si move* shows traces of Guittone's egalitarian love ethic, in which love is constituted by reciprocity between a lover and the beloved. The structural unity of Francesco's poems is achieved by the linking devices of the oral tradition (*capfinidas* and paronymy), reminiscent of Sicilian forms.

Maestro Torrigiano

No identification had been established for the Florentine poet known as Maestro Torrigiano (fl. (1200s). Contini (1960) notes that Torrigiano might have been a physicist who studied in Bologna, taught in Paris, and died before 1313. Torrigiano's seven sonnets (collected in MS Vatican Latino 3793) seem to represent three phases of his production.

The first three poems (*Chi non sapesse*, *Né volontieri*, and *Amore*) treat courtly themes and are executed in an easy style, linking octave and sestet through the technique of *coblas capfinidas*. The poems *Essere donzella* and *S'una donzella* use popular, or sung, elements, as well as mild equivocal rhyme; *S'una donzella* echoes the ethic of the nobility of the soul, rather than of lineage, proposed by Tuscany's merchant poets. Finally, *Merzé* and *Vor[r]ei che mi facesse* reflect experimentation with severe rhetorical poetics; here the poet adopts obscure equivocal rhymes and thematic patterns similar to Guittone's early love lyrics.

Magdalene Master

The Magdalene, or Madalen, Master (fl. c. 1265-1290) was a painter active in Florence, where he was evidently in charge of one of the city's busiest workshops. He is known today mainly for a group of paintings of the Virgin and child, whose direct designs combine a sensitive characterization of the figures with ornate decoration. To judge from the number of surviving works, he was much in demand with the mercantile class. In fact, donors are often included in his paintings, during a time when it was still relatively rare for the patron to be represented.

Sirén (1922) was the first to detect a single artistic personality behind some paintings, none of which is dated, that he associated with a large panel of *Saint Mary Magdalen with Eight Episodes from Her Life* (c. late 1280s–1290; Florence, Accademia). Subsequently, others, including Coor-Achenbach (1947) and Offner (1927), augmented this corpus,

although a minority of art historians expressed doubt that a single hand was responsible for the entire group. Problems with authorship notwithstanding, the body of work generally associated with the *anonimo* (anonymous) artist reflects tendencies in coeval Florentine painting, allowing scholars to propose a framework for stylistic development and chronology. Three successive phases are therefore commonly described, and these take account of the art of the Bigallo Master, Coppo di Marcovaldo, and Cimabue.

Magdalen Master (thirteenth century), *Mary Magdalene*. Accademia, Florence.
Photo: © Scala/Art Resource, N.Y.

A dossal of the *Virgin and Child with Saints Leonard and Peter* (c. 1270; Yale University Art Gallery) is considered an early work and is

characterized by strongly delineated, immobile forms. The impact of Coppo, the greatest painter of the generation preceding Cimabue, is evident in the master's middle phase, which is characterized by a greater awareness of the form-defining qualities of modeling and the organic unity of body and drapery, as the Berlin *Virgin and Child* (c. 1280, Gemaldegalerie) testifies. The art of Cimabue informs the master's later style, of which the Florence *Magdalen* is an example, and this can be detected in the more accentuated grace and elegance of the forms, as well as in the increased subtlety of tone and color.

Magic

Magic, as discussed here, is the supposed act of influencing or controlling events by ritual means, usually through the supposed intervention of supernatural powers. Belief in magic was widespread throughout medieval Italy at all levels of culture, from the church

hierarchy to illiterate peasant villages. While magic may strike us today as an irrational system of belief, it has its own inner logic and operational rules, described by Frazer in *The Golden Bough* as "sympathetic magic." According to this analysis, magic rituals operate according to two principles: homeopathic magic (like causes like) and contagious magic (things once in contact behave as though they are still in contact). Most magic spells and rituals are based on one or both of these principles.

Medieval magic did not consist of a unified body of beliefs and practices; rather, it varied according to the period, region, and cultural milieu in which it was practiced. The Italian medieval worldview, like that in much of medieval Europe, was characterized by a belief in an animate world in which God, saints, angels, and demons were real, and at times even inanimate objects seemed imbued with independent life. Many medieval thinkers, for example, believed that rotting compost could generate new life-forms. Thus, magic permeated almost every aspect of medieval Italian thought, and it is difficult to separate magic from medicine and other physical sciences in texts of the period. Indeed, medieval thought was characterized by its lack of a division between the natural and the supernatural worlds. The preoccupation with magic must be understood within this context.

Agrarian and Other Magic

In rural Italy, many pre-Christian beliefs and customs associated with the agricultural-pastoral yearly cycle and with the fertility of crops and livestock persisted into the late Middle Ages, despite efforts by the church to suppress them. Ginzburg (1983, 1989) describes how in the region of Friuli beliefs about *benandanti* ("good walkers")—individuals born with a caul who on certain nights would do spiritual battle against evil sorcerers and witches for the safety of crops and livestock—persisted into the late sixteenth century, when they were eliminated by the Inquisition. Similarly, in the area around Modena, the cult of Diana seems to have continued as late as the fourteenth century. These customs existed not in opposition to Christianity, but alongside it, and they often acquired Christian symbolism. In the same way, folk healers

often combined the use of herbs with sympathetic magic and Christian prayers.

Divination, the art of trying to predict the future, was commonly practiced and took a number of different forms. Astrology, the study of stars and planets in the belief that they influence events on earth, had been popular in late Roman times and reentered the medieval world with the Arabs. Because astrology was put to political use, emperors periodically banished all astrologers—and because of its connection with magic, the church often denounced it. Yet many learned people believed in its efficacy. Saints Augustine and Thomas Aquinas believed that the stars governed most people's desires, although they also believed that a Christian could exert free will to overcome this influence, and to overcome base appetites. Astrology was also important in medicine and agriculture. Avicenna believed that each bodily part was governed by a certain planet, and many peasants planted crops according to the phases of the moon. Other methods of divination included augury (predicting the future by interpreting the behavior of birds and animals or by reading patterns in their entrails); scrying (reading the future in a mirror, a clear glass, a bowl of water, or some other reflecting surface); and the use of a pendulum device over a bronze table with letters on it, similar to the modern Ouija board. Tarot cards were introduced to Venice by Egyptian Arabs in the early fourteenth century, but evidence suggests that they were used in games and were not intended primarily for fortune-telling.

Alchemy was a pseudoscience that attempted—through chemistry, astrology, and religious purification—to transform base metals into gold. Alchemists believed that pure gold, or the "philosophers' stone," could turn other materials to gold, cure disease, and grant its owner everlasting youth. Many alchemists were motivated by greed, but in the hands of philosophers such as Albertus Magnus, alchemy became a sublime spiritual endeavor—a striving for human purification and union with the divine in which the scale of metals was a symbol of human longing for God.

Magicians

Albertus Magnus, whom Dante depicted in paradise, was only one of a number of learned Italians of the time who were considered magicians by their contemporaries. Dante put Michael Scot (c. 1170–1232) and Guido Bonatti (dates unknown) in hell for attempting to predict the future. These two men were both learned in astrology. Scot was the astrologer of Emperor Fredrick II and the more learned of the two; he translated Avicenna into Latin and practiced medicine as well as alchemy and astrology. Bonatti practiced astrology for the benefit of Forli, his hometown; he tried to influence the reconciliation of Guelfs and Ghi bellines by calculating the astrologically appropriate moment. Peter of Abano (1250–1318) lectured in medicine and astrology at the University of Padua. Because of his beliefs, he was persecuted by the Inquisition and barely escaped death at the stake, though his books were burned and he died awaiting his second trial. Abano's treatises were later published by Trithemius and Agrippa, along with their own, in the fifteenth century. Cecco d'Ascoli (d. 1327), who held the chair in astrology at the University of Bologna, was burned at the stake by the Inquisition for having calculated Christ's horoscope. Many of these "magicians" were, in fact, early scientists who ran afoul of the church because of their inquiring and experimental casts of mind. They influenced later Italian thinkers such as Pico della Mirandola (1463-1494) and Giambattista della Porta (1538-1615).

Magic and the Church

The early church took a cautious and sometimes inconsistent attitude toward magic. The practice of magic for evil purposes (witchcraft) was condemned by the councils of Elvira (306), Ancira (314), and Trullo (692), but the councils of Braga (563) and Paderborn (785) denied the existence of witchcraft and the efficacy of magic. Within the church, there were those who believed in magic and considered it, and divination, to be of demonic origin. This view gained popularity in the aftermath of the writings of saints Augustine and Thomas Aquinas. During the twelfth century, surviving pre-Christian folk beliefs and practices were increasingly identified with the demonic and condemned as evidence of witchcraft. Indeed, any kind of magic outside church-

sanctioned rituals came to be thought of as implying demonic intervention. Not until the thirteenth century, however, did the mythology of witchcraft and the sabbat begin to coalesce and become identified with the worship of Satan and a conspiracy against the Catholic church. The impetus for this mythology was the threat of heretical sects such as the Cathars and the Waldensians, who were identified with devil worshipers in order to discredit them. In 1235, the Inquisition was established to combat heretical sects, and in 1258 Pope Alexander IV expanded it to include the practice of magic and witchcraft.

Although the church condemned magical practices outside its own auspices, many religious rituals clearly fell into the category of sympathetic magic. The early church relied on reports of miracles and healing to gain converts, and the rite of exorcism was used from the beginning as a ritual cure for mental illness and epilepsy. The use of relics, talismans, crosses, and blessed objects to avert evil and guarantee salvation was widespread in medieval Italy. The worship of saints often involved sympathetic magic; an example is the custom of leaving charms in the shape of body parts in saints' shrines in the hope of effecting a cure for a diseased limb or organ. This was derived from an identical Roman custom involving pagan temples. Thus it was not the idea of sympathetic magic as such that troubled the church; rather, its practice outside the Catholic monopoly of the sacred threatened the church's hegemony. This perceived threat led to the persecution of thousands of innocent victims and the destruction of much medieval learning.

Magyars

The Magyars, ancestors of the modern Hungarians, were a Turkic tribe or tribal coalition that migrated from west-central Asia to eastern Europe in the ninth century. The Magyars terrorized central and eastern Europe in the last half of the ninth century and the first half of the tenth century. They invaded northern Italy in 898 and 899, forcing Berengar I of Friuli to pay tribute and ally himself with them. In 922, during an invasion by Rudolph of Burgundy, Berengar called the Magyars to his aid. After Berengar's murder in 924, the Magyars invaded Italy again and burned Pavia (March). A final raid occurred in 927.

Military historians often minimize the damage inflicted on Italy by the Magyars, noting that it was hard to find pasturage for the Magyars' horses during the Mediterranean dry season (late spring, summer, and early fall). Also, steppe tactics were not very effective in the mountainous terrain that dominates most of Italy. It is not surprising

that most Magyar incursions were confined to northern Italy, where the dry season is not as pronounced and the geography is not as rugged.

Maitani, Lorenzo

Lorenzo Maitani (before 1270—June 1330) was a central Italian painter; he was born in Siena and died in Orvieto. He is first documented in 1290 in Siena, in connection with a land registry declaration. Maitani is associated more with Orvieto, however, where he worked almost exclusively after 1310, when he was called to work on the cathedral of Orvieto, which was in danger of collapsing. In his contract of 16 September 1310, he was offered Orvietan citizenship and designated *universalis caput magister* of the cathedral, a role that required him not only to direct its completion but also to maintain the city's bridges and civic buildings. The contract also indicates that Maitani was skilled in making roofs and buttresses. Indeed, a lost inscription on one of the cathedral's ornamented beams contained his name and the year 1327, substantiating his involvement in the erection of its roof; moreover, scholars believe that the four extant corrective buttresses in the side chapels of the transept are probably his. In Orvieto, Maitani also enlarged the Palazzo del Comune, rebuilt the fountain in the piazza, and repaired the town's gates and walls. Elsewhere, he served as consultant on several architectural projects, including aqueducts in Perugia (1317 and 1319-1321), the cathedral of Siena (1322), and the castles at Montefalco (1323) and Castiglione del Lago (1325).

As coordinator of Orvieto's cathedral project, Maitani advanced construction of the facade to the level of the gallery below the rose window. Moreover, most scholars credit him with the actual design of the facade, and the second of two preliminary drawings of the facade is attributed to him (both drawings, on parchment, are in the Museo del Opera del Duomo in Orvieto). The drawing that is presumably by Maitani resembles the completed facade in several ways. For instance, it shows a square frame around the rose window containing fifty-two compartments, three double niches arranged vertically on each side of the rose, a triangular gable above the rose, at least one pilaster crowned with a sculptured evangelical symbol, and an *agnus del* surmounting the gable of the central portal. Though neither signed nor dated, the drawing probably is the one referred to in the inventory of 1356 as being from the hand of "[Magister] Maitani." Both it and the first drawing (which some scholars also assign to Maitani) constitute the earliest history of the production of a facade from contract to drafted plans to carved stone.

It can be inferred (though not proved) that Maitani was a sculptor as well as an architect. First, the contract of 1310 states that he was skilled in making "walls figured with beauty" (*pariete pulcritudine figuratis*), a phrase which accords well with the dozens of exquisitely carved human, angelic, diabolical, and divine figures decorating the marble facade of the *duomo*. Second, an entry in the cathedral account books of 1330 records that he received bronze with which to cast the eagle of John the Evangelist, still located on the cornice above the third pilaster of the facade. Whether the bronze was cast by him or by someone working under him is unknown. He certainly helped manufacture gold glass *tesserae* for the mosaics of the upper facade in 1321, a task that broadens his role as an artisan at the cathedral.

Lorenzo Maitani, *Last Judgment: The Damned* (detail). *Duomo* facade, Orvieto. Photograph courtesy of Christopher Kleinhenz.

Despite the lack of incontrovertible documentation, most scholars believe that Maitani created at least some of the sculptures of the facade, but opinions as to which parts could be his vary greatly. Many credit him with the marble reliefs on the first and fourth pilasters depicting Genesis and the Last Judgment, as well as with the bronze and marble *Maestà* over the central portal and the bronze evangelical symbols atop each pilaster. One reason for this attribution is the strong stylistic affinity of the works, suggesting that they emerged from a

single major workshop. However, there is also an argument against Maitani's direct participation in the creation of the sculptures: he was preoccupied from 1310 to 1330 with numerous architectural projects in Orvieto and elsewhere; in the contract of 1310, he was granted permission to retain assistants for the design and execution of the sculpture of the facade; and there is no known body of sculptured work by him.

The design of the reliefs of the four pilasters is unique because the many scenes are enclosed not by rectilinear frames but by coiling acanthus leaves or undulating grape and ivy vines. The grapevines refer to the wine of the eucharist; the ivy, which is evergreen, implies immortality, thereby adding eschatological symbolism. The carving of the pilasters that many attribute to Maitani—Genesis and the Last judgment—is especially beautiful. In *God Creating the Birds and Fish*, the water flowing across the aquatic creatures reveals their wriggling forms with the subtlety of a silk veil; in the *Damned in Hell*, an unconscious victim whose arm is being ingested by a dragon is rendered with impressive anatomical realism: there are wrinkles across the belly and veins in the pit of one elbow. Whatever the authorship of the reliefs on the pilasters, they permit scrutiny of the procedures of *Trecento* sculptors because the upper half is unfinished and the phases of execution are thus evident.

Three crucifixes and a sculpture of Christ seated, all in Orvieto, have been attributed to Maitani, though not convincingly.

Malaspina Family

The Malaspinas were a feudal house, fundamentally Ghibelline but largely Guelf, from the 1250s, and associated principally with the Magra Valley in Lunigiana. From c. 1000 their pretensions to influence brought them into conflict with nearby towns, especially Genoa, and with the bishopric of Luni. In the twelfth century these powers confined

the Malaspinas to the higher reaches of the Apennines, though their control extended eastward beyond Garfagnana and had considerable strategic significance. By the early thirteenth century they had been forced back into their ancestral possessions, where they consolidated their position. In 1221 the family formally divided into two branches: the Spino Secco ("dry thorn") and Spino Fiorito ("flowering thorn"). In the third quarter of the century, both divided again, the Spino Secco into four branches (based at Mulazzo, Villafranca, Giovagallo, and in the Trebbia valley) and the Spino Fiorito into three (Verrucola, Filattiera, and Olivola). The combined branches definitively outmaneuvered the see of Luni in the early fourteenth century. The last phase of growth, after 1328, produced the marquises of Fosdinovo and, ultimately, Massa. In the fifteenth century the family's landholdings began to disintegrate under pressure from Florence and Genoa. Four Malaspinas are mentioned by Dante, and one is the protagonist of a (probably apocryphal) story by Boccaccio.

Malispini, Ricordano

Ricordano Malispini (probably fourteenth century) was allegedly the thirteenth-century author of a history of Florence from its legendary origins to 1282; a continuation down to 1286 was ascribed to a nephew, Giacotto. Some scholars consider this chronicle an important source for Giovanni Villani and Dante. Documentary evidence has been found for Giacotto's existence, though not for Ricordano's. However, the chronicle itself contains anachronisms, some of which were first noted by Scheffer Boichorst (1870), and these make a fourteenth-century date very probable. A chief purpose of the chronicle appears to have been to celebrate the exploits of members of the Bonaguisi family, and to link the Bonaguisi with the aristocratic and once-powerful Malispini family. Malispini writes that he derived his information from chronicles he found in the house of his Capocci kinsmen in Rome, and also in the Badia of Florence. The Capocci records seem identifiable with the *Libro fiesolano*, which is a translation and adaptation of the *Liber de origine civitatis*, the first surviving account of the founding of Florence. The Badia records seem identifiable with an anonymous compendium of Giovanni Villani. The only known text of this compendium, discovered by Lami (1890), is manuscript 2.1.252, held in the Biblioteca Nazionale Centrale in Florence. Malispini also includes information about some families that are not mentioned either in the *Libro fiesolano* or in the compendium of Villani.

The *Libro fiesolano* covers the period from the legendary origins of Florence to its rebuilding after Totila's sack (which is fictitious) and the final capture of Fiesole. The anonymous compendium abridges and paraphrases Villani's chronicle from chapter 30 of the first book (Catiline's conspiracy) until 1336. Malispini copies his account of early Florentine history from the *Libro fiesolano*, rather than from the anonymous compendium, but he includes Charlemagne's supposed participation in the rebuilding of Florence, which is mentioned in the compendium but omitted in *Libro fiesolano*. Malispini then follows the anonymous compendium to 1282, and Giacotto's coda follows it to 1286.

One manuscript, often considered the oldest and most reliable copy of Malispini, has a distinctive relationship to the anonymous

compendium. This is manuscript 2.4.27, in the Biblioteca Nazionale Centrale in Florence. It corresponds almost exactly to the anonymous compendium not only for the period from Charlemagne to 1286, but also for 1286-1317. The only novelty in this concluding post-Malispinian portion of the manuscript is its interpolated passages praising the Bonaguisi and other related families. These passages are very similar to others praising the same families in this and other manuscripts of the Malispinian chronicle. The presence of such passages in both the Malispinian and the post-Malispinian portions of this manuscript points to the genealogical purpose and the fourteenth-century date of the Malispinian compilation. A further confirmation of its late date is furnished by Porta (1986, 1994), who discovered links between the texts of the anonymous compendium of Villani and Malispini on the one hand, and a revised version, made after 1333, of Giovanni Villani's chronicle on the other. If Villani had copied Malispini, these links would be present in the first version of Villani's chronicle as well.

Such evidence should lay to rest the old theory that Malispini was the thirteenth-century father of Florentine historiography. Malispini was, rather, a late fourteenth-century compiler, whose originality was limited to celebrating the nobility and antiquity of certain Florentine families and to furnishing information about himself and his sources designed to validate such genealogical lore.

Malmaritata

The term *malmaritata*—literally, "badly married woman"—derives from the Old French *mal mariée* and designates the female protagonist of a particular genre of lyric poetry, as well as the poetic genre itself (*chanson de mal mariée*). Poems in this genre focus on a wife who suffers abuse from her husband and laments her state, complaining that he is jealous (*geloso*), mean, and uncaring. The abuse may take the form of physical violence or simple neglect. In the economy of the poem, the woman generally vents her sorrow and also the anger she bears toward her husband. One common consequence of the situation is that the woman not only entertains the notion of acquiring a lover to compensate for her husband's ill-treatment, but that she often acts on it. Several examples of this genre survive in the poetry of the Sicilian school.

The subject of a popular *canzone* by Compagnetto da Prato fits this generic category; its first verse declares: *Per lo marito ch'ò rio* ("For the evil husband that I have"). In the second stanza the female protagonist takes her husband to task for his jealousy, which has led him to mistreat her: *Geloso, battuta m'ài/piaceti di darmi doglia* ("Jealous one, you have beaten me, you take pleasure in giving me sorrow"). The woman explains that her desire to take a lover was fostered by her husband's

false accusations; and the poem, as it unfolds, moves from her monologue to the sudden appearance of her lover on the scene and a dialogue between the two.

A variant on this theme is found in the *canzone* *Già mai non mi conforto* by Rinaldo d'Aquino, one of the poets of the Sicilian school. In this poem the female protagonist laments the fact that her lover is departing for the crusades and refers to her husband as one who, having learned of her illicit love affair with the departing crusader, beats her and keeps her in captivity. The stanza in question reads as follows: *Quando la croce pigliaio,/certo no lo mi pensai,/quelli che tanto m'amao/ed illu tanto amai,/chi [eo] ne fui bat[t]uta/e messa en pregonia/e in celata tenuta/per la vita mia!* ("When the man who loved me took the cross, I certainly did not think it would come to this point, but I loved him so much that I was beaten on his account and held in captivity, hidden away, for my entire life"). While the language and general situation certainly belong to the genre of the *malmaritata*, it may also be possible to interpret the person who mistreats the woman not as her husband but as an overly protective father who wishes to safeguard the honor of his daughter.

The anonymous *canzone* *Di dolor convien cantare* has an unusual structure: a woman's monologue within the (male) lover's monologue in which the usual complaints against a cruel husband are offered. The *topos* of the *malmaritata* is also present in the anonymous *canzone* *L'altro ier fui 'n parlamento* and in the dialogic *canzone* *Donna, di voi mi lamento* by Giacomino Pugliese.

Malpaghini, Giovanni

Giovannia Malpaghini (Giovanni da Ravenna, Giovanni di Jacopo; 1346 –c. 1417 or 1422) was influential, through his teaching at the *studio*, in the formation of *Quattrocento* or Ciceronian humanism in Florence. He was born in Ravenna and began working as Petrarch's amanuensis in 1364. It seems that Malpaghini became disenchanted with being Petrarch's copyist and tried to leave his service in April 1367 but he did not succeed until 1368. Two letters of reference on his behalf from Petrarch survive—to Francesco Bruni and to Ugo di Sanseverino (*Rerum senilium libri*, 11.8 and 11.9, respectively)—and he and Petrarch remained close friends until Petrarch's death in 1374. Malpaghini found employment with Bruni in the papal curia in Rome and then moved to Avignon in 1370. From 1394 on, Malpaghini taught rhetoric and the major authors in the Florentine *studio*; in 1412 he is recorded as lecturing on *librum Dantis, quem legat diebus festivis*. Only one piece of his own writing survives: a letter lamenting the death of Petrarch, *Conquestus de morte Petrarce* (Sabbadini 1924, 248-249). Malpaghini is traditionally believed to have died in 1417, but 1422 has also been suggested. He has often been confused with another Giovanni da Ravenna, Giovanni Conversino (1343–1408).

Manfred

Manfred (1232–26 February 1266) was the natural son of Emperor Frederick II Hohenstaufen and Bianca Lancia of Monfer rato; he closely resembled his father physically and, to a considerable degree, temperamentally. Manfred was an astute politician and courageous soldier; he was the emperor's intellectual soulmate, but his own personality was less dynamic. Manfred's career was confined to Italy. His illegitimate birth limited his political effectiveness, and he ultimately lost his kingdom to the combined forces of the papacy, Charles of Anjou, Tuscan financiers, and Sicilian barons. The defeat of Manfred sent the *Mezzogiorno* (southern Italy) into a centuries-long decline, the effects of which linger to the present.

Manfred may have studied at Paris and Bologna, and he was active in the courtly culture of the kingdom of Sicily. When Frederick died in December 1250, Manfred became the regent of his half brother, Conrad IV (1250–1254), who was in Germany. Manfred was generally popular among the feudal nobles of the kingdom, but he faced persistent opposition from important barons and cities. In 1251, he tried but failed to reach an accord with Pope Innocent IV (r. 1243-1254). Manfred may have offered to exchange recognition of papal overlordship for the Sicilian crown. In December 1251, Conrad went to the kingdom to establish his own royal authority. He revoked all of Manfred's fiefs except the principality of Taranto and forced the humiliated Manfred to remain at court.

Conrad died in May 1254. Guelf chroniclers insist that Manfred

poisoned him, but other sources do not concur. Manfred then faced great difficulties. Conrad had named the church as guardian of his son, Conradin, and appointed the leader of the German barons, Berthold of Hohenburg, as his bailiff. Innocent IV invested Edmund, the second son of King Henry III of England, with the kingdom. Meanwhile, Pietro Ruffo, who controlled Calabria and Sicily, played Manfred against Innocent.

Most of the nobility of the kingdom rallied to Manfred, whom they considered the natural regent of young Conradin. The pope refused to recognize Conradin's rights and demanded possession of the kingdom. Open warfare ensued, and Innocent excommunicated Manfred and his adherents. Manfred was unprepared for war and quickly sued for peace. During the negotiations he killed a papal partisan and fled to Lucera, the imperial Muslim stronghold near Foggia. Manfred seized the treasury of Frederick II and Conrad IV and raised a powerful army. He defeated the papal army near Foggia. Almost all of Apulia had fallen into his hands by the time Innocent died (10 August 1254).

Manfred could not placate Innocent's successor, Pope Alexander IV (r. 1254-1261), but Alexander actually put little effort into the vendetta of the papacy against the Hohenstaufen. Manfred was thus free to put the kingdom in order. By 1257, he had imprisoned Berthold and banished Pietro Ruffo. On the false rumor that Conradin had died, the Sicilian barons proclaimed Manfred king. He was crowned at Palermo on 10 August 1258. Manfred soon became deeply involved in central and northern Italy. He attempted to create a federation of barons, cities, and factions under his leadership by providing military assistance, negotiating treaties and marriages, and courting urban factions. In 1258, he joined in a promising but unsuccessful alliance with the despot of Epirus, Michael II, against the Byzantine emperor, Michael VIII Palaeologus. In 1262, Manfred arranged a marriage between his daughter Constance and the *infante*, Peter of Aragon; this marriage would later justify Aragon's intervention in the Sicilian Vespers uprising of 1282.

Manfred reached the height of his power when he and the Ghibelline factions of Florence and Siena defeated the Guelfs of Tuscany at Montaperti on 4 September 1260. He subsequently posed as lord of Italy and sent vicars throughout the peninsula, but he did not have the force

to sustain his ambitions. When the energetic Urban IV (r. 1261–1264) became pope, he renewed the assault on Manfred. Urban found a champion in Charles of Anjou, count of Provence and brother of Louis IX of France. Louis had previously blocked papal overtures to Charles, but Urban argued that Manfred had unlawfully dispossessed his nephew Conradin, and this reasoning apparently laid the scruples of the saintly king to rest. The pope also persuaded Florentine and Siennese bankers to finance an invasion of the kingdom of Sicily.

Late in 1262, Manfred attempted to make a deal with Urban, but the negotiations collapsed. The pope invested Charles with the kingdom in December 1262. War soon followed. Manfred's allies scored several early victories against papal and Guelf forces and almost captured the city of Rome in 1264. After Urban died, the new pope, Clement IV (r. 1265–1268), quickly confirmed the treaty with Charles, who left Provence for Rome in May 1265. Manfred dispatched a manifesto to Rome, in which he revived Frederick's argument that the Romans—not the pope—had the right to choose the emperor. There is no extant reply. Charles arrived in Rome on 28 June 1265 and took charge of the war against Manfred.

After an unsuccessful attack on Rome in August 1265, Manfred returned to his kingdom to find his domestic enemies ranged against him and his treasury empty. Many of his allies went over to Charles, made peace with the pope, or became neutral. In December 1265, Charles's army from Provence passed through Piedmont and Lombardy without opposition. Charles moved into Campania in January 1266 without a fight. Betrayed and deserted by the Sicilian barons, Manfred died bravely on the plain of Grandella near Benevento on 26 February 1266. He was buried outside Benevento, but the archbishop of Cosenza later had his remains disinterred and removed from the kingdom to an unmarked grave near Garigliano.

Manfred's fall may have been inevitable. The papacy was determined to extinguish the Hohenstaufen dynasty, and Charles of Anjou was a hard and relentless campaigner, whose talents and war chest were equal to his greed and ambition. The fickle Sicilian barons who betrayed Manfred did not prosper as a result. After slaughtering Manfred's adherents, Charles replaced the treasonous barons with his own French supporters. Charles exploited the efficient Sicilian fiscal apparatus to

bleed the kingdom white, but he returned none of the good government that had accompanied the Normans' and the Hohenstaufens' exactions. Commerce fell into the hands of Venetian and Genoese merchants and Tuscan bankers, and wealth flowed to the Angevins or migrated from the *Mezzogiorno* altogether. The powerful, well-ordered, and prosperous kingdom of Sicily gave way to bad government and chronic poverty.

Manfred was an active patron of poets and scientists and a scholar in his own right. He sponsored and perhaps engaged in the translation of Greek and Arab treatises on philosophy. He revised and commented on the *De arte venandi cum avibus* of Frederick II, which the emperor had dedicated to him. In the *Commedia*, Dante depicts Manfred at the base of the mount of Purgatory with a band of souls who had repented their sins at the moment of death (*Purgatory*, 3.103-145). The legend of Manfred's heroic and pious end, which inspired Dante, was turned to nationalist purposes in the nineteenth century during the Risorgimento.

Maniakes, George

George Maniakes (d. 1043) was a Byzantine general of great courage, boldness, and resourcefulness and a man of unusual physical stature, though of harsh and reckless character. He earned an enormous reputation for his services on the empire's eastern frontiers. In 1037, he was sent by Emperor Michael IV to southern Italy, as commander extraordinary, to restore order in the troubled and revolt-torn Byzantine territories there. Maniakes's particular assignment, however, was to undertake the reconquest of Sicily from the Saracens, a project frequently pursued by the Byzantines and apparently contemplated earlier, in the 1020s, by the great military sovereign Basil II.

With typical energy and skill, Maniakes launched his attack in 1038; his forces included a detachment of Viking-Varangians under the famous Harald Hardrada, as well as some 500 Norman mercenaries. He rapidly took control of the eastern end of the island and stood well to conquer the rest, but he was apparently plagued by dissension between his diverse commanders and soldiers, and—most significantly—he was undermined by court intrigues at home. Of humble birth and choleric character, Maniakes had made many enemies, especially among the

court aristocrats. As a result of their scheming against him, he was recalled to the capital in 1040 and imprisoned on false charges. Without him, the Sicilian campaign collapsed completely, and rebellions again broke out in the Apulian territories under Argyrus, son of Melo—with the Normans' dangerous help, Argyrus had established himself as duke of Bari.

Under the next emperor, Michael V, Maniakes was released and sent back to Italy in early 1042 with the full title of *katepano*. He succeeded in winning over Argyrus, and he carried out unusually harsh operations to suppress rebellion and curtail the Normans, but again his bitter enemies at court worked against him, poisoning the mind of the succeeding emperor, Constantine IX. Learning of this latest outrage in September 1042 (and possibly with seditious intentions already in mind), the furious Maniakes rebelled. Taking with him most of the imperial troops in his command, he crossed to the Balkans and set out to storm Constantinople and seize the throne for himself. He might well have succeeded, but on the brink of a victory in a battle along the way, in the spring of 1043, Maniakes was suddenly killed, and his head was brought to the capital to be displayed. His departure from Italy, meanwhile, created a power vacuum that opened the way for the aggressive Normans to move almost unchecked in their conquest of southern Italy.

Almost legendary in his own time, Maniakes left memories that endure even today, as in a tradition that gives to Frederick II's fortress in Syracuse the quite erroneous popular designation *castello Maniace*.

Mantua

Mantua, in northern Italy, lies just beyond the Po where the Mincio widens. The city was named, according to legend, for Manto, the divining daughter of Tiresias. Originally settled by the Etruscans about 3,000 years ago, and invaded by the Gauls in the second half of the fourth century B.C., the predominantly agricultural settlement was subdued by Rome c. 190 B.C., and its lands were later ceded to retired veterans of the Roman army. In A.D. 49, Mantua gained full Roman status as a *municipium*.

In the next few centuries, Mantua enjoyed relative peace but experienced little economic growth. After the split of the Roman empire into the west and east in 395, Ravenna became the seat of the western empire, and Mantua—lying on the road between Ravenna and Milan—became a crossroads of traffic and troop movements. Although Mantua was isolated from the other cities of the empire following the devastation of Rome by Alaric's Visigoths in 410, it was barely touched directly by the series of barbarian invasions of the fifth century, surviving even Attila's merciless sacking of towns and cities in northern Italy.

Although Attila did eventually retreat after negotiations with Pope Leo I, which took place about 6 miles (10 kilometers) from Mantua, some of the Huns remained. In fact, it was a soldier in Attila's sendee, Odoacer, who brought the western Roman empire to its knees in 476. But again Mantua remained untouched, even though Odoacer's victory in Rome left it even more isolated from the major centers of communication. In fact, its isolation protected Mantua from much of the carnage that ravaged Italy in the following decade. In the fifth century, its city walls enclosed approximately 40 acres (160,000 square meters) and were often bulging with refugees from less fortunate cities. Relief came in August 489 with the entry of Theodoric and his Goths. After breaking through Odoacer's defenses and taking Via Postumia, Theodoric's army defeated Odoacer's at Verona and pushed on to Milan. Mantua, however, experienced only small raids and a few brief skirmishes.

In 493, Ravenna fell to Theodoric, giving him virtual control of the

entire Italian peninsula until his death on 30 August 526. Under the Gothic empire, Mantua lived quietly, and the victors and vanquished mingled peacefully. Following Theodoric's death, however, war broke out again, this time between Byzantium and the Goths. In 553, the imperial forces of Constantinople defeated the Goths in Campania, and the Goths, pillaging as they went, abandoned Italy. Byzantine reign was cut short by the entry of the Lombards, led by King Alboin, in 568. The Byzantines, barricaded at Ravenna, left their subjects, Mantua included, to fend for themselves. One after another the cities and fortresses of eastern Italy fell to Alboin's army. When Alboin died in 572, a large part of Italy was under the Lombards' control. A few strongholds, including Mantua, continued to resist the Lombards' siege, but Mantua fell in 602 to Agilulf, who then ordered that the city walls be dismantled. Rebuilding soon followed, however, as the Mantuans and the Lombards mixed easily. Because Agilulf's wife, Theodolinda, was a Christian, relations between the Mantuan church and the Lombard victors were reasonably harmonious. The Mantuans were free to administer the goods of the community, maintain their own statutes, and declare their own laws in their own language. Under the Lombard government, Mantua enjoyed higher prestige and greater importance, both military and commercial, especially after it was designated as a Lombard fortress. This designation inspired a fervor for building, and the city, for the first time, looked to expand beyond its natural confines, reclaiming land from the surrounding swamps. Beyond the waters ringing the city, agriculture also flourished as the Mantuans enacted laws guaranteeing private property rights and protecting agricultural endeavors.

Notwithstanding the apparent peacefulness of the period, the growing power of the papacy was increasingly coming into more frequent conflict with the Lombard kings. Nonetheless, Lombard expansion continued, culminating in Aistulf's seizure of Ravenna and the Exarchate in 751. Aistulf's dream of a united Italy, however, was impeded by the litigiousness of the duchies and the claims of Pope Stephen II to power over all of the lands seized by Aistulf from Byzantium. The conflict reached a climax when the Franks, with whom the Lombards had been struggling for the previous twenty years, seized Pavia, the Lombard capital, in June 774 and their king, Charlemagne,

promised to support and protect Stephen's successor, Hadrian I.

But the end of Lombard rule did not mean the end of Lombard administration. Under Frankish rule, the former Lombard communities were often permitted to retain their laws and customs, and in many cases only the titles changed. Even at that, there are few instances in Mantua of the Frankish *comes* or *conte* replacing the Lombard *dux* or *duca*. There was a *conte* Oddo in 820, twenty years after Charlemagne was crowned emperor, but very few other examples.

Mantua nourished under Carolingian rule. In 780 and 787, Charlemagne himself visited the city, which was granted a bishop's seat following the discovery of a reliquary containing blood said to be that of Jesus. Mantuan tradition had long held that Saint Longinus, the soldier who pierced the side of the crucified Christ, had gathered up the blood-soaked sand at the foot of the cross and placed the blood in a reliquary which he buried in Mantua in the year 37. The reliquary remained lost until 804, when an apparition of the apostle Andrew revealed its location. Several months after this relic was found, Pope Leo III authenticated it at Charlemagne's request. The discovery not only elevated Mantua's ecclesiastical status but also increased its commerce, as pilgrims flocked to the oratory dedicated to Saint Andrew built on the site of the discovery.

The persistence of the legend regarding Longinus underlines the early Christian associations of Mantua, whose tradition holds that Saint Romulus, on the instructions of Saint Peter, visited Mantua in 48, and that Barnabas preached there in 51. Irrespective of the validity of these legends, by 201, two-thirds of Mantuan had already converted to Christianity and as early as 313 the Mantuans had constructed a Christian church.

Mantua's new religious and political prestige was confirmed in 827 when Louis the Pious, Charlemagne's son and successor as emperor, chose it as the site of a synod to resolve a secular controversy. The synod attracted all the northern bishops, Pope Eugene's ambassadors, and representatives of the empire, stimulating the construction of many new churches as well as public and private buildings.

Palazzo Ducale, Mantua, Photograph courtesy of Christopher Kleinhenz.

In the absence of a *comes* representing imperial power, the bishop was the central power in the city and the surrounding *contado* (county). The economic and political power of the Mantuan church is explicit in the Concessions of Berengar (king of Italy from 887). These concessions, passed in 894, gave the bishop of Mantua full jurisdiction over all his *domini* (domains), fiscal rights over various markets, and supervision of the treasury, albeit in the name of the king. The rapid economic development of the Mantuan church is seen in the establishment of the many monasteries outside the city: in particular, the monasteries of Saint Thomas at Acquanegra, of Saint Mary at Folonica, and of Saint Benedict in Polirone.

Politically and defensively, Mantua during the ninth century remained the virtual island it is geographically. It was untouched by the Arab aggression that threatened the south. The power of its bishop spared it much of the fighting between the great vassals that followed the decline in the Carolingian empire after Charles the Great was overthrown in 887. There is an unconfirmed legend of a long Magyar siege, which occasioned the burial of the reliquary containing the blood of Christ (the reliquary was found again, thanks to a prophetic dream, in 1048), but apart from that, even the Hungarian invasions in 898 and 899 failed to interrupt Mantua's prosperity.

In the tenth century, Mantua ceased to be untouchable. Having earlier joined Bergamo, Brescia, Piacenza, Parma, Reggio Emilia, and Modena to form the *Marca Attoniana*, loyal to the Attoni of Canossa, a politically powerful family, Mantua was now caught up in a great struggle between imperial and papal forces which emerged in the wake of the Carolingian decline. In the mid-tenth century, Emperor Otto II of Germany granted dominion over vast territories to the powerful Canossa family in return for their support of the German imperial party in Italy. In 977, the Canossa became the *conti* of Mantua. Under the Canossa, Mantua prospered both economically and politically, even though the earlier prominence of its bishop was greatly curtailed. Tedaldo, Atto Adalberto's son and successor in 1012 as governor of the *marca* (which by this time included Ferrara), often resided at Mantua. Tedaldo's son and successor Boniface expanded the family fortunes through a marriage to Beatrice of Lorraine. Boniface's violent reign ended when he was assassinated while hunting in 1052. Emperor Henry III, in an effort to limit the widow Beatrice's power, in 1055 abolished a number of taxes imposed by Boniface and confirmed the rights and goods of the bishop of Mantua.

In response, Beatrice married the German Gottfried, thereby forging an Italian-German power base that Henry could not ignore. In 1055, Henry entered Italy to reclaim control of some of the domains. Granting goods and favors to cities and bishops, he took Beatrice and her daughter Matilda as virtual prisoners and returned to Germany with them. On Henry's death, Beatrice and Matilda returned to Italy, but not to Mantua. Matilda succeeded Beatrice in 1076 and sided immediately with the pope against imperial power. Beatrice was unpopular with the Mantuans, who encouraged the hostilities of 1091, which resulted in the city's surrender to Henry IV. Similarly, the Mantuans abetted the revolt in 1114 that ended in the destruction of the Canossa castle at Rivalta. Matilda died in 1115 without heirs, and when Henry V descended into Italy the next year to claim possession of the goods left by Matilda to the church, Mantua was declared an autonomous *comune*. The Mantuans were then free to tear down the Canossa palace and were exempt from paying taxes to maintain the imperial army.

At this point the bishop of Mantua resumed the position of power he had enjoyed before the Canossa era. In 1133, Lothair III, Henry V's

successor, confirmed Mantua's autonomy and its administrative boundaries as the Mincio, the Tartaro, and the Oglio. Under Frederick I Barbarossa, king of Germany, who was crowned emperor in 1155, imperial interference in Mantua became substantial. Henry V and Lothair III had been too distracted by other problems to concern themselves much with the Italian *comuni*—which had flourished, bringing about the slow extinction of the troublesome feudal lords. Frederick Barbarossa, however, saw the *comuni* as too closely tied to the church, and therefore a threat to imperial power. His attempts to contain this threat started with his invasion of Milan in 1155; this was only the beginning of a long series of wars involving Milan, Pavia, Brescia, Lodi, and Bergamo. Mantua supported Frederick against Milan in 1158, sending soldiers to assist the imperial troops. When Milan eventually capitulated, Frederick demanded the submission of all of the Italian *comuni* and named an imperial functionary to each. A further rebellion by Milan in 1161 caused Frederick to destroy the city and demand the pope's total submission, but the seeds of rebellion had been sown. In 1164, Verona, Padua, and Treviso formed an anti-imperial league. In 1167, Cremona promoted a second league, the *Lega Lombarda*, which Bergamo, Brescia, Milan, and Mantua promptly joined. This league defeated imperial troops in 1176 at Legnano; and in 1183, with the peace of Constance, the autonomy of the Lombard *comuni* was formally recognized.

Mantua spent much of the next century embroiled in conflicts with its communal neighbors, Cremona and Verona. Nonetheless, Mantua prospered and its great landowners moved from the surrounding county to the city, prompting internal rivalries and almost daily violence inside the walls. The violence came to a head when, on 14 March 1235, the *podestà*, Guidotto da Correggio, was assassinated as a result of a plot involving the Awocati, Poltroni, Calorosi, and Casaloldi families, whose members then fled to Verona. An emergency government promptly exiled the offending families, but the troubles continued until Pinamonte Bonacolsi, together with Federico da Marcaria, was nominated *rector* for a term of two months and four days on 4 July 1272. Within a short time, Bonacolsi, who was charged with restoring the city to peaceful coexistence, had accused Marcaria of plotting against the *comune* and exiled him along with the current

podestà.

After a constitutional reform in 1274, Bonacolsi was nominated as *capitano del popolo*, a title not previously mentioned in the communal statutes. He decided to have at his side a second *capitano del popolo*, Ottonello Vanecalli, but he eventually accused Vanecalli of plotting against the city and had him exiled. Bonacolsi then assumed the duties of *capitano generate* for life. He continued his sweeping reign by exiling the most violent families and confiscating their goods. Recognizing that Mantua's increasingly commercial economy depended on peace with its neighbors, he took to negotiating and confirming numerous treaties and accords, but his major concern was cementing an alliance with Verona and gaining the support of the emperor. Thus, Mantua declared itself Ghibelline—that is, loyal to the empire—and Palazzo Bonacolsi was fitted with the telltale Ghibelline crenellations.

Bonacolsi was similarly opportunistic with respect to religion. Though nominally hostile to the papacy, he sought the support of the Mantuan church by initiating a hunt for heretics. His power, however, was challenged by his son Bardellone, who staged a military coup on 29 September 1291. Bardellone's brother Tagino was in Verona at the time, but on his return he was imprisoned by Bardellone and then exiled to Ferrara. Bardellone governed formally alongside his father, but from 29 September on there are no official records of Pinamonte Bonacolsi, who died, forgotten, on 7 October 1293.

Bardellone continued to augment his powers as de facto lord of Mantua. Nominated as *rector perpetuus et capitaneus civitatis*, he instituted a new constitutional reform, under which, on 2 July 1294, he replaced the *consiglio maggiore* with the *consiglio del signore*, consisting of twelve elders, three for each of the four quarters into which the city is divided, named by the *capitano del popolo* and chosen from the most visible citizens. The new *consiglio del signore* was given judicial and executive power, rendering the communal institutions of Mantua essentially impotent, particularly in light of the fact that Bardellone also established a private military force.

Bardellone continued his father's policy of maintaining public order and reinforced relations with Verona. However, Tagino's pardon and return from Ferrara in 1298 caused discord between the two cities, since the Veronese viewed Tagino as an agent of the marquises of Este, the

lords of Ferrara. Indeed, Tagino persuaded Bardellone to loosen Mantua's ties with Verona in favor of Ferrara, and on 24 June 1299 the Bonacolsi and the Estensi signed a series of accords at Ferrara. In response, Alberto della Scala, lord of Verona, sought to depose Tagino and Bardellone in favor of Guido, Bardellone's nephew, who was espoused to Alberto's recently widowed daughter, Constanza. By replacing Bardellone and Tagino with Guido, Alberto della Scala was able to create a close ally. Thus, the Veronese military, led by Alberto's son Bartolomeo, entered Mantua, took over the Palazzo Comunale, and forced Bardellone and Tagino to step down. Bardellone died a year later, and Tagino returned to Ferrara. On 29 July, Guido was nominated *capitano generale* and *podestà*, and several days later he married Costanza.

As *podestà* and *capitano generale* for life, Guido quickly seized control of the bureaucracy and acquired the right to name all his functionaries. By adding the right to govern with or without the *consiglio*, he acquired for himself the power to exile; absolve; condemn; declare war; conclude peace; forge alliances; and nominate the *podestà*, rectors, and judges. Under Guido, the counsel of elders no longer met in the Palazzo Comunale; instead, it met in the house of the *capitano generale*. Finally, he had the counsel nominate his brother, Rinaldo Passerino, as vicar and successor.

Guido began construction, in what is today Piazza Sordello, on the Palazzo del Capitano, which would eventually become the Palazzo Ducale of the Gonzaga family. Under Guido the first written code of Mantuan law, *Statuti bonacolsiani*, was prepared. When Guido died on 24 January 1309—the only one of his family who left office without being a victim of a coup or a plot—he was succeeded by Rinaldo Passerino, who had originally been exiled from the city by his uncles Bardellone and Tagino.

Though formally respecting the communal institutions, Passerino looked to Henry VII of Luxembourg as a means of obtaining the official title of lord of Mantua. To curry favor with Henry, Passerino assumed an overtly antipapal position, for which he was excommunicated and branded with heresy. Henry's plan to restore imperial authority in Italy, however, consisted of little more than an attempt to extract tribute through a network of tax-collecting vicars. At the inception of

Passerino's reign, the vicar was the Veronese *podestà* Lapo degli Uberti, but he was quickly routed by Passerino, who, along with his brother Bonaventura, was named imperial vicar. In the summer of 1311, the two brothers insisted that the title be recognized officially by the *consiglio*; and immediately afterward, Henry also granted Rinaldo Passerino the vicarage of Modena.

In 1328, the Mantuans responded to Passerino's reign of tyranny and crippling taxation. Just before dawn on 16 August, some 1,100 armed soldiers sent from Verona by Cangrande della Scala at the request of Luigi Gonzaga (1267-1360) entered Mantua, with the help of Luigi's sons Guido, Filippino, and Feltrino and a few well-paid sentries. As planned, allies of the Gonzaga staged a public uproar that drew Rinaldo Passerino out of his home to the Palazzo Comunale, where he was killed by Alberto di Savoia, a Gonzaga ally. Passerino's sons Francesco and Giovanni (abbot of the monastery of Sant Andrea) and Bonaventura's sons Guido and Pinamonte were captured and walled up alive in a tower at Casteldario. Meanwhile, in Mantua, the crowds gathered in the streets acclaimed Luigi Gonzaga as he knelt, raised his arms, and thanked God for having liberated Mantua from tyranny. Luigi led the crowds to the cathedral, where he knelt again and repeated the thanks while his supporters raided the houses of the Bonacolsi. For 400 years the day remained a public holiday.

In 1329, Luigi Gonzaga was named *capitano generale*, with powers even broader than those of his predecessors. He was given the right to choose his successor and to name whomever he wished to the government. Passerino's body was preserved and displayed in a hall of the Palazzo del Capitano, which was then occupied by Luigi Gonzaga. In 1329, Emperor Louis IV named Luigi imperial vicar. In 1331, Charles IV, Louis's successor, granted to Luigi the Bonacolsi estates and the vicarage of Cremona, Reggio, and Asola and further extended his realm to the banks of Lake Garda.

Mantua's expanding power was, however, soon challenged when Milan declared war in an attempt to regain parts of Brescia and Verona seized earlier by the Gonzaga. The war went on sporadically for some years, and in 1357 Luigi's grandson Ugolino defeated the Milanese at Montechiaro, capturing Bernabo Visconti's castle. During a cease-fire, Ugolino made a peace with Milan, pursuant to which Ugolino married

Bernabò's daughter Caterina. Notwithstanding the ongoing wars, Mantua was becoming more culturally refined and was visited by the leading poets of the day, including Petrarch in 1349.

Luigi died in 1360 and was succeeded by his son Guido, Ugolino's father, Ugolino's brothers Francesco and Ludovico were envious of the amount of responsibility given by their father to Ugolino, and they murdered him in 1362. To avoid the appearance of family instability, Guido had Ugolino secretly buried, forgave Ludovico and Francesco, and sent Caterina back to Milan. Ludovico's treachery was not forgiven by Bernabò Visconti, who resumed war on Ludovico and the Gonzaga in 1368 to avenge his son-in-law's death. Ultimately, Charles IV brokered a peace under which Ludovico's son Francesco was to marry Caterina's sister, Agnese Visconti.

When Guido and Francesco died, in 1369, Ludovico (called Ludovico II) was elected as *capitano generale*. Irrespective of the dubious way in which he came to power, Ludovico did much to improve Mantua's fortunes. He secured the city by reconstructing it and repairing its fortifications; he freed Mantua from debt and promoted its prosperity; and he showed himself to be liberal and upright in conduct while in power. When Ludovico died, in 1382, his son Francesco, though married to Agnese since 1380, was nonetheless, at age fourteen, too young to succeed him as *capitano generale*. In 1388, however, Francesco was elected to the office, in which he remained until his death on 17 March 1407. During his rule, Francesco was loyal to the treaty with Milan and was on good terms with Gian Galeazzo Visconti. This changed, however, when Gian Galeazzo deceived Francesco into believing that Agnese was unfaithful and plotting his assassination. Francesco had Agnese tried, condemned, and secretly beheaded on 7 February 1391. Gian Galeazzo responded by sending his forces against Mantua, claiming vengeance for Agnese's death. Francesco and his allies defeated Gian Galeazzo's troops in August 1397, and in May 1398 a truce of ten years was proclaimed. However, when Francesco later learned of Gian Galeazzo's deceit, he entered into a league against the Visconti.

In 1405, Venice offered Francesco the position of *capitano generale*, which Francesco accepted, and in which capacity he won Verona and Padua for Venice. His second marriage, to Margherita Malatesta of

Rimini, extended the family fortune beyond the traditional allies of Mantua. Francesco was a great patron of the arts, and a builder—he added to the *palazzo* started by the Bonacolsi in the thirteenth century, and the cathedral was refaced in 1400 under his instruction. Although the Gonzaga still depended on the laws, taxes, and institutions of civic government, such as the "Council of Twenty" and the "Council of Twenty," for the elective title of *capitano*, these had long been under the family's control. Thus, when Francesco, generally considered a good ruler by the Mantuans, introduced revised statutes in 1404, he was virtually unopposed.

When Francesco died in 1407, the Mantuans decided that his son Gianfrancesco, born in 1395 and a ward of Venice, should succeed him as *capitano generale*. While he was still a minor, Gianfrancesco ruled through his uncles Carlo Malatesta (whose daughter Paola later married Gianfrancesco) and Bartolomeo of Perugia. Although Gianfrancesco had fought for Venice against Emperor Sigismund in 1411, he and Sigismund later reconciled; and on 22 September 1433 Sigismund conferred on Gianfrancesco the title of marquess of Mantua. Gianfrancesco ruled as such from 1433 until his death in November 1444. A great patron of the humanists, he founded the first university at Mantua, and in 1423 he brought Vittorino da Feltre to Mantua to educate his sons.

Gianfrancesco's son Ludovico, born in 1414, succeeded him and ruled as Ludovico III, second marquess of Mantua, from 1444 to 1478. Ludovico was married to Barbara of Brandenburg, Sigismund's niece, and inherited the lands of his two brothers Gianlucido and Alessandro when they died. Under Ludovico III the court was one of the most brilliant in Italy, and he was known as an outstanding example of a Renaissance prince.

In the fifteenth century, Mantua continued to flourish as a prosperous agricultural and stock-breeding economy. Cloth production (woolens and later silk) enjoyed a revival, and by 1500 Mantua had almost 25,000 inhabitants and was growing. Because of its location it was vulnerable to the ambitions of Venice and Milan, but through clever maneuvering the Gonzaga managed at most times to maintain its independence and to prosper, developing Mantua into one of the most highly cultivated and splendid courts of the Italian Renaissance. The last duke in the

Gonzaga line died in 1627, and Mantua was sacked in 1630. The city was annexed to Austria in 1708.

Marchetto Da Padova

Marchetto da Padova (Marchetus de Padua, early fourteenth century) was the most important and most influential music theorist in Italy during his time. Documents at the cathedral of Padua attest to his presence as a teacher in 1305-1307. Three treatises of his survive: *Lucidarium in arte musice plane* (Cesena and Verona, 1317 or 1318), *Pomerium in arte musice mensurate* (Cesena, later than *Lucidarium* but no later than 1319), and *Brevis compilatio in arte musice mensurate pro rudibus et modernis* (later than *Pomerium*). An acrostic in the text of the motet *Ave regina celorum/Mater innocencie* identifies Marchetto as its author.

Marchetto made fundamental contributions to the theories of mode, chromaticism, and tuning in *Lucidarium*, and to the theory of mensuration in *Pomerium* and *Brevis compilatio*. The theory of mode involves the classification of plainchant melodies by final (a sort of keynote), range, scale structure, and melodic articulation. This classification is crucial for the correlation of (among other sorts of pieces) recitation tones for the psalms with the antiphons that frame them. Whereas traditional modal theory had stressed final and range as determinants of mode, Marchetto stressed scale structure and articulation; this change of perspective, along with his development of the concept of modal mixture, enabled the classification of melodies that had earlier been dismissed as anomalous. Marchetto's modal doctrine spread through Italy and beyond during the next 200 years and became the foundation of the modal theory of polyphonic music during the Renaissance.

Earlier theories of melody based on hexachords (six-note *ut-re-mi-fa-sol-la* prototypes) and their connection through a process called mutation allowed only for diatonic progressions; though they served plainchant melodies well, these theories failed the chromatic progressions (e.g., progressions directly from c-natural to c-sharp) favored by Italian composers of the early fourteenth century. Marchetto developed a theory to accommodate such progressions and coined the term "permutation" for the hexachord connections they entail; though the term gained a certain currency in music theory of the fourteenth

century, it disappeared as fifteenth-century composers abandoned chromatic progressions.

Though he espoused the traditional so-called Pythagorean tuning system, in which all perfect fifths are pure, Marchetto modified the system by describing the slight raising of sharped notes in certain contrapuntal contexts, a process that increases the harmonic piquancy of some combinations of notes and makes them seem to drive toward notes of resolution; this procedure has important implications for the performance of fourteenth-century music. Marchetto's "fifths" of whole tones must surely be taken as rough approximations rather than precise measurements; nonetheless, the concept of fractional division of whole tones represents a crucial step in the abandonment of the arithmetic strictures of the Pythagorean system, in which equal division of the whole tone was conceptually impossible. This step was necessary for the eventual development of equal temperament.

The thirteenth century had seen far-reaching developments in the theory of mensural notation, a theory which Franco of Cologne codified late in the century. Franco based his system on a note value called the breve (corresponding roughly to a measure in modern notation) that was divisible only into thirds at primary and secondary levels; Franco worked out elaborate rules for notating rhythms within these limitations. A handful of theoretical and practical sources from around 1300 documents attempts to expand Franco's system, but the earliest comprehensive treatise to succeed in doing so was Marchetto's *Pomerium*, which describes primary and secondary divisions of the breve into two or three parts and tertiary division into two parts, resulting in divisions of the breve into two, three, four, six, eight, nine, or twelve parts, which can then be combined in various ways, even involving syncopation within and between breve units. *Pomerium* became the foundation of Italian mensural theory of the fourteenth century, and it sheds light as well on the early stage of French mensural notation, a system that coexisted with the Italian and eventually supplanted it.

Marco Polo

See Polo, Marco

Margaret of Cortona, Saint

Margaret of Cortona (c. 1247–1297) was a penitent and mystic. Her *Legenda*, the most authoritative account of her life, begins like a tragic

romance: Margaret, the beautiful daughter of a peasant farmer in Laviano, ran away at sixteen with a nobleman who promised to marry her but did not. They lived together for nine years and had a son, but then Margaret's lover was killed, and she was shocked into repentance. She left all her possessions and tried to return home, asking forgiveness. When her father and stepmother turned her away, she and her child found refuge in Cortona with two gentlewomen who were associated with the Franciscan community there. A few years later Margaret was admitted to the Franciscan-sponsored Order of Penitents (which later became the third order). She spent the rest of her life as a humble penitent in Cortona, enduring extreme deprivations to atone for her sins and devoting her time to charity, peacemaking, and intense periods of prayer and meditation. By the time she died, local belief in her sainthood was so strong that miraculous cures were spontaneously reported at her tomb. Despite repeated petitions to the papacy, however, annual celebration of her feast day (22 February) in Cortona was not officially authorized until 1515, and her actual canonization was delayed until 1728.

The early documents about Margaret raise tantalizing questions because they speak with multiple and sometimes clashing voices. Although her *Legenda* is attributed to the Franciscan friar Giunta Bevegnati, who served as one of her confessors and eventually compiled most of the text, in reality it has several layers of authorship: Margaret recounted her visions while Fra Giunta took notes; another priest filled this role during the last seven years of her life, when Fra Giunta was absent from Cortona; other witnesses supplied supplementary information; and the final text was reviewed and further edited by both civil and ecclesiastical officials. Recovering Margaret's authentic voice and experience from such a composite text may be impossible, although feminist scholars have begun to try. What does emerge clearly from the *Legenda* and other early sources is the struggle that went on after her death over the right to display her relics and claim the benefits of her patronage. Recent studies have identified three main parties in this struggle: Franciscan friars; civic leaders of Cortona; and adherents of San Basilio, the church that became Margaret's shrine.

In the *Legenda* itself, the strongest voice is Franciscan. Indeed, the text recounts numerous visions in which Christ expresses special favor

toward the Franciscans, reminds Margaret that he has personally entrusted her to their keeping, and urges her always to obey them. The *Legenda* also holds Margaret up as an example for other Franciscan tertiaries to follow and portrays her, in effect, as a testimonial to the virtues that a lay penitent could acquire under Franciscan guidance: humility, self-discipline, reverence for the clergy and the eucharist, perfect orthodoxy (always a key question about uncloistered women), and even the restoration of virginity. As Schlager (1998) has suggested, these emphases may have been chosen partly to overcome the friars' own resistance to the papal mandates that made them responsible for potentially dangerous female penitents.

Other portions of the *Legenda*—including practically all the miracle stories, which were originally omitted from Fra Giunta's account and appended in the last chapter—link Margaret more closely with local needs and aspirations in Cortona. And Margaret's own reported words and actions sometimes support the local agendas too. In the decade before her death, she distanced herself somewhat from the Franciscan friars by moving to a solitary cell near San Basilio, which was then just a small secular church in poor condition, and choosing its priest, *ser* Badia, as her final confessor. She supported this church by obtaining an indulgence for those who helped with its rebuilding, and she founded a charitable confraternity whose first chaplain was *ser* Badia. When she died, it was San Basilio that received her body for burial, although the Franciscans insisted for decades that she had made a permanent commitment to them. Civic leaders asserted the town's own claim to her body, arguing that she had chosen to live in Cortona and had contributed significantly to the general welfare by founding a hospital for the poor, resolving conflicts between rival factions, and negotiating an agreement that persuaded the warlike bishop of Arezzo to cancel an impending attack.

Statue of Saint Margaret, Cortona. Photograph courtesy of Christopher Kleinhenz.

As Bornstein (1993) has shown, using archival sources that survive in Cortona, the contest over Margaret's relics had economic and political ramifications. When the miracles began around her tomb, San Basilio reaped the most obvious benefits. In the next few decades, this church acquired an impressive new sanctuary, suitable for welcoming pilgrims, and a rich endowment based on bequests. Civic leaders invested generously in the expansion and adornment of San Basilio (eventually

renamed Santa Margherita) and the promotion of Margaret's cult, and the investment evidently paid off in terms of Cortona's increasing prestige and political independence. The Franciscans were shut out until the end of the fourteenth century, when town leaders invited them to replace the secular clergy who had hitherto administered the new church and Margaret's shrine. But the town itself retained—and still retains—legal ownership of Margaret's body.

An ambitious study by Cannon and Vauchez (1999) enriches and complicates this picture by reminding us that the contest over Margaret's cult was partly about the right to define the religious and symbolic identity of Cortona's patron saint. This issue mattered greatly not only to the Franciscans, but also to the civic authorities of Cortona and certain subgroups within the town, including the local clergy and the next generation of male and female tertiaries. The different ways in which these Cortonese groups reconstructed Margaret's identity, in the light of their own corporate traditions and priorities, are barely suggested in the *Legenda* and other written sources. But, as Cannon demonstrates, a great deal can still be learned about them by studying what remains of the paintings and sculpture that were added to the church of Santa Margherita in the fourteenth century to honor this not yet canonized saint. More work will surely be done with the wealth of fascinating detail that Cannon and Vauchez have brought to light.

Margaretto Da Arezzo

Margaretto da Arezzo (Margaritone d'Arezzo, Margarito d'Arezzo; d. 1293) was a painter in the Tuscan primitive style. Though a number of his works remain, there is little reliable documentary evidence from which to construct a chronology of his life. A single notarial document, unrelated to his work, places him in Arezzo in 1262, and his signature on a number of retables—*Margaritus de Aritio me fecit*—suggests that

he was probably born there. As to the date of his birth, Vasari posited 1216 but gave no reason for such a supposition. It is reasonably clear, however, that Margaretto was active during the second half of the thirteenth century.

During Margaretto's lifetime, Arezzo was a flourishing autonomous Ghibelline *comune*. This independence is reflected in the Aretine school of painting, which borrows from, and is often identified as, the Byzantine style, relying on formal iconography repeated in much the same design. However, the Aretine style, and Margaretto's style in particular, were not entirely Byzantine. The art critic Roberto Longhi (d. 1970) noted the importance and complexity of Margaretto's figurative sources, recognizing in them a genuine freshness which differentiated this artist from the current Byzantine style. Similarly, Vasari noted the novelty of Margaretto's technique: Margaretto combined canvas, glue, and gypsum to ensure, when painting on wood, that the joints were secure enough to eliminate the appearance of cracks or fissures.

Although the details of Margaretto's life and work are at times mostly speculation, there are many extant works quite certainly attributable to Margaretto, including eight signed panels depicting the life of Saint Francis of Assisi, one of the painter's favorite subjects. Probably the most famous of these is the Saint Francis in the state museum of medieval and modern art in Arezzo, the likely prototype of all the images until the eighteenth century reproducing standard episodes from the life of the saint. Originally it adorned the convent of Sargiano. Other depictions of Saint Francis signed by Margaretto are currently housed at Castiglion Fiorentino, Cortona, Ganghereto, Rome (Vatican), Siena, and Zurich.

Another image that figures prominently in Margaretto's work is the Madonna and child enthroned. There are examples at the National Gallery in London as well as the National Gallery in Washington, but, again, the most noted example is found in Arezzo: this is a *Madonna and Child Enthroned* now housed, like the Saint Francis, in the state museum, but originally from Montelungo. It is significantly influenced by Christian-oriental iconographic sources. Particularly evident is the influence of the frescoes of Baouit and of Saqqara in Egypt, knowledge of which probably reached Italy through monks and monasteries. Longhi, relying on a sixteenth-century inscription, proposed a tenable

date of 1250 for the work, but even this date has been disputed and cannot be confirmed.

Another work of note attributable to Margaretto is a *Madonna and Child Enthroned* (*Santa Maria delle Vertighe*) with episodes or *storiette* from the life of the Virgin housed at Monte San Savino (Arezzo). A barely legible Gothic inscription on the work was for some time mistakenly interpreted as indicating that Margaretto simply undertook the restoration of a much older retable. However, closer inspection reveals that the word *Restanrus* is in fact the name of a person, Ristoro, who collaborated with Margaretto. It is likely that this Ristoro was the miniaturist who executed the *storiette*, while the other parts of the altarpiece were probably done by Margaretto in his later phase—that is, sometime between 1274 to 1283. Once again, however, there is a dispute among critics and historians as to the accuracy of this date.

Although the bulk of his work appears to have been completed in and around Arezzo, it is highly possible (but not certain) that Margaretto also traveled to a number of cities in Tuscany, the Marches, and Umbria, and even went as far as Rome to complete various projects.

Vasari indicates that, in addition to painting, Margaretto engaged in sculpture and architecture, including work on the Ves covado in and c. 1275 and the design of the palace of the governors at Ancona. According to Vasari, Margaretto designed the palace of the governors, which is in the Byzantine style, and carved the eight windows of the facade. Vasari also attributes the design of the church at San Ciriaco in Ancona to Margaretto. None of this, however, can be confirmed.

Margaretto died at age seventy-seven and was buried in the old cathedral, which has since been demolished, outside Arezzo.

Marino Ceccoli

Marino Ceccoli (fl. mid-1300s) was a Perugian lyric poet. His date of birth is uncertain, but he was writing by 1335, is mentioned in a list of Perugian *iurisperiti* (lawyers) compiled in 1355, undertook a diplomatic mission to Florence in 1366, was addressed as "a man of outstanding eloquence . . . and the intimate favorite of the Muses" by Coluccio Salutati in a letter of 1369, and—to judge by a previously unnoticed reference in the Perugian archives—may still have been alive in 1371. Ceccoli's small output (twenty-five sonnets, a *canzone*, and three Latin letters) is preserved in manuscript Vaticano Barberiniano 4036 (of 1345-1353). His works have at least two distinct but related stylistic features. One, derived from *poesia giocosa*, is a colorful treatment of everyday life and a parody of the themes and diction of *poesia aulica*. The other is a more straightforward approach to serious issues—love (specifically, homosexual love), religion, and politics.

Markward of Anweiler

Markward (d. 1202) was a member of the class of *ministeriales* ("unfree knights"). He emerges first in 1184, as steward to the future emperor Henry VI. In 1193-1195, Markward helped Henry to conquer Sicily; in reward, he was freed, and at the diet of Bari in 1195 he was made duke of Romagna and Ravenna and margrave of Ancona, all areas to be won from the papal state. (The titles were apparently valid only in Italy.) Markward never obtained all these areas, but he got most of the Romagna by 1197, to the pope's fury. Henry VI died in 1198, leaving his "testament" to the custodianship of Markward—or so Markward alleged. This testament was a set of guidelines for ensuring the future of the kingdom of Sicily and especially for securing the throne for Henry's eldest son, the future Frederick II (then two years old). Markward

accordingly claimed the regency of Sicily, despite opposition from the papacy. The text of the testament gives no support to this claim, but the testament survives only in papal sources and was perhaps edited. The dowager empress Constance also opposed Markward's claim: she drove him out of Sicily, claimed the regency for herself, and obtained the approval of the papacy for her son's coronation.

Markward went to the Romagna but failed to hold it against papal troops sent by the new pope, Innocent III. Markward then gave his support to Philip of Swabia, Henry VI's brother, who was claiming the empire for himself in opposition to the papal claimant Otto of Brunswick. When Constance died, Markward again claimed the regency of Sicily (whether on behalf of Philip or Frederick is unclear). Meanwhile, the chancellor of the Regno, Walter of Palear, who was acting independently of either the pope or Philip, opposed Markward, possibly intending to uphold Frederick's claims but possibly simply out of jealousy.

In 1199, Markward attempted to establish his claim by force and, supported by various Germans and by the Saracens of western Sicily, waged a destructive war. The pope accordingly proclaimed a crusade against him (even though the Fourth Crusade was currently being preached). This has been called the first of the political crusades against Christians, but Innocent evidently wanted to represent it as another crusade against an infidel, since he emphasized Markward's links with the Sicilian Saracens. To support the crusade, Innocent called in Walter of Brienne, husband of the only surviving relative of the last Norman king of Sicily, to take over the government of the Regno (though not the kingship, since Innocent, as his acknowledged overlord, was bound to protect Frederick's throne). Walter of Palear, furious at this, opened negotiations with Markward, but shortly afterward (June 1200) papal troops routed Markward near Monreale. Markward recovered, helped by Walter of Palear, and in November Markward and Walter agreed to share the regency: Mark ward was to retain the island of Sicily, Walter was to retain the mainland, and Walter's brother was to take charge of Frederick. But when Walter of Brienne won a victory on the mainland (1201), Markward seized Frederick and occupied Palermo, which had hitherto remained independent of both him and Walter of Palear. From then until his death, Markward acted as guardian of Frederick and

regent of Sicily. He failed, however, to recover the mainland, where Walter of Brienne scored another victory, eliminating Walter of Palear and stopping Markward from extending his power further.

Marsilio of Padua

Marsilio of Padua (Marsiglio, Marsilius de Mainardino; c. 1275 or 1280-1342 or 1343) was an antipapal political theorist. He was the son of the notary of the University of Padua and studied Aristotelian philosophy there; later, he taught this philosophy at Paris, where he was rector in 1313 and eventually studied theology. His obscure career took many turns: he also was a priest, a physician, and a diplomat. In 1319, he went on an embassy for the Ghibelline leaders Matteo Visconti and Cangrande della Scala. Among Marsilio's associates were the astrologer Peter of Abano; the humanist Albertino Mussato; the Averroist John of Jandun; and, in later years, William of Ockham.

In 1324, in Paris, Marsilio completed his masterwork, *Defensor pads* (*The Defender of Peace*), which circulated anonymously until his authorship was discovered in 1326. Expecting to be condemned as a heretic for his antipapal opinions, he took refuge at the court of the pope's archenemy Lewis of Bavaria, whom he served for the rest of his life. Lewis was guided by Marsilio's theories when he went to Rome in 1327 and was crowned emperor in the name of the people. Likewise, Lewis claimed that the Roman church should be administered by the emperor, and, accordingly, he appointed Marsilio as his administrator, with the title of imperial vicar for spiritual affairs in Rome. The emperor could not maintain himself for long in Italy, however, and by 1330 he was back in Bavaria. In 1342, Marsilio was still with Lewis, serving as his physician and counselor. At this time Marsilio wrote *Defensor minor*, in which his earlier work was summarized and extended to prove that the emperor had jurisdiction over questions of

marriage.

Marsilio's central concern was the political power of the papacy, which he, like Dante, saw as the principal cause of civil strife in Italy. To restore peace, Dante sought to revive the Roman empire; Marsilio was more realistic. He insisted that the state should control the church, but he devised a generalized theory of the state that could fit not only the empire but also national monarchies and even city-states. Thus, his proposals, far from threatening civil governments, offered them control over their several churches. *Defensor pads* is accordingly divided into two principal parts: the first discourse (*dictio*) argues that political power belongs exclusively to the secular state; the second counters the papacy's claims to independent political status and makes the state the administrator of organized religion.

Marsilio's concept of the state is closely modeled on Aristotle's *Politics*. The state is a natural phenomenon, arising from man's nature as a political animal. Government exists so that all men may lead the "sufficient life," i.e., "live and live well." The form of government is not set by nature, however; instead, a community is formed by the mutual agreement of its members to live together under laws to which they have consented. Thus, for Marsilio, the foundation of all government is the "human legislator," i.e., the people of the community who make the laws. Marsilio is not a democrat; he realizes that not everyone is fit to participate in legislation, and he restricts the *legislator humanus* to the "prevailing part" (*valentior pars*) of the citizens, who are better or more numerous (or both) than the others. The Marsilian "legislator" is usually too numerous to do more than authorize the actual ruler (the *pars principans*), e.g., an elective emperor, a hereditary king, a *podestà*, or a council. In practice, all legislative, judicial, and executive functions are delegated to this ruler, who can, however, be deposed by the human legislator that appointed him. Thus, Marsilio's general theory of the state allows for diverse constitutions—monarchical, aristocratic, and even democratic. The main point, for his purpose, was that the ruler has a monopoly on political power within his state. A competing power independent of the ruler would be contrary to nature.

Marsilius of Padua. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 224r.

The second discourse of *Defensor pacis* defines the proper place of the clergy, and especially the pope, within this political framework. In general, the job of the clergy is to preach the gospel and administer the sacraments. Clergymen are chosen and supported by the state, which administers all the worldly affairs of the church. In effect, the Franciscan ideal of poverty is extended to the whole clergy. Furthermore, Marsilio regards bishops as priests to whom the ruler has delegated certain executive duties, and the bishop of Rome is superior to the rest only insofar as he has been granted a few broader powers. Marsilio elaborately rebuts the papacy's position that the pope is Peter's successor as vicar of Christ and denounces its claim to "plenitude of power" (*plenitudo potestatis*) as the "singular cause of strife or civil

discord." Thus, each state controls the church within it. When questions of faith arise that affect the church as a whole, the emperor can call an international council, consisting of laymen as well as clergy, to settle the matter. Enforcement of the council's decisions, however, is wholly up to the local rulers.

Marsilio completely reversed the dominant view that church and state exercise coordinate jurisdictions ("Gelasian dualism"). For more than three centuries, *Defensor pacis* was the arsenal of antipapalists, especially in the age of conciliarism and the Reformation. Many of its ideas were already current in university circles, but Marsilio gave them coherent, scholarly, and passionate expression. Moreover, his arguments appealed to a broad audience trained in Aristotle's logic and political philosophy; no special knowledge of law or theology was required. He moved beyond scholasticism in his use of history to explain institutional development.

Marsilio's theory of the state was not the main thrust of his work, but many readers have been unduly impressed by this theory because it appears to anticipate such modern doctrines as popular sovereignty and the social contract; they thus overlook the other, deeper medieval roots of these ideas.

Martin I, Pope

Pope Martin I (saint; d. 655, r. 649-654) was born in Todi of a noble family. He rose to posts in the papal court, and under Pope Theodore I (r. 642-649) he was sent as legate to the imperial court in Constantinople. There he observed the religious crisis surrounding the young emperor Constans II, who attempted in his *Typos* (648) to still the controversy over the Monothelete doctrine promulgated by his grandfather Heraclius to conciliate the dissident Christians of the east who supported Monophysitism.

Martin, who was strongly opposed to these imperial policies, was elected pope in clear contempt of the emperor and was consecrated without awaiting the emperor's legally required ratification. At the urging of the dissident theologian Maximus the Confessor, the new pope showed further defiance by calling a synod of Italian prelates, which met at the Lateran Palace (April-October 649) and condemned the policies of both Heraclius and Constans. The synod thereby formally put the papacy on record, for the first time, in full opposition to both Monothelism and the new emperor's moratorium on debate over it. Martin went on to take other bold actions in dealings with prelates of the eastern church.

Outraged at this defiance, and determined to crush all religious dissent, the fiery young sovereign ordered his new deputy, Olympius, the exarch of Italy, to enforce the *Typos* there and to arrest the pope. But the exarch evaded this order and, according to some reports, was urged by Martin to rebel against the emperor and usurp the imperial title. Whatever his stance, Olympius died soon afterward (652), on his way to Sicily. Constans sent a new exarch, Theodore Calliopas, under the same orders, and in 653 Martin was confronted by troops in the Lateran church where, already ailing, he had taken refuge. The pope was taken into custody (19 June) and brought by ship first to the island of Naxos, and then, in September, to Constantinople itself, where he was tried on charges of treason. Under sentence and the threat of death,

Martin was imprisoned and treated with utmost brutality. He was then conveyed into exile in Crimean Cherson in the spring of 654. He died there on 16 September of the following year, having already been replaced as pope in Rome.

Regarded as a martyr for his faith, Martin was canonized and is considered a saint in the Greek as well as the Roman church.

Martin IV, Pope

Pope Martin IV (Simon de Brie, Simon de Brion; c. 1210-1285, r. 1281-1285) was surnamed "of Brie" from the region near Paris where his father held fiefs as a knight. Martin's career was colored by his loyalty to his native France and to his royal benefactors. Royal patronage secured him a benefice that paid for his education, first in arts at Paris and then in law at Parma. After graduation, from 1248 to 1259, he held a succession of administrative positions in the diocese of Rouen, rising eventually to be head of the cathedral chapter. He soon attracted the favor of Louis IX (Saint Louis), who made him treasurer of the church

of Tours (1256) and then keeper of the royal seal (1259) in charge of the king's chancery. Simon was on the verge of becoming a bishop when his career took an abrupt turn in 1261.

Urban IV, a fellow Frenchman, had just become pope, and he called Simon to Rome to be cardinal priest of Saint Caecilia. Simon spent the next twenty years in the service of the papacy. For half of this time, he was the pope's legate in France, where his close ties with the French court were a significant diplomatic asset. In 1264, he successfully concluded an agreement between the papacy and the king's brother, Charles of Anjou, whereby Charles would become the pope's vassal for the Italian Regno, or kingdom of Sicily, if he could conquer it, as eventually he did. Simon's lifelong loyalty to France and the Capetian dynasty made him an ardent supporter of Charles's interests at the papal court, so Charles in turn exerted his influence to have Simon elected pope in 1281. Simon returned the favor throughout his pontificate.

Characteristically, the new pope chose a name that suggested his ties to France and to the church of Saint Martin of Tours. For the previous ten years, Martin's predecessors had kept Charles of Anjou at arm's length. However, Martin IV embraced him, placed him in charge of the civil government of Rome with the title of senator, and appointed his protégés as administrators in the papal states. Charles was planning an attack on Constantinople, and so Martin further obliged him by excommunicating the Greek emperor, Michael VIII Palaeologus, even though this ruptured a brief union of the Greek and Latin churches. After the Sicilian Vespers (1282), the rebel cities at first hoped Martin would accept them as his direct vassals, but, placing Charles's interests before those of the papacy and native Italians, he rebuffed them. Instead, all the material and spiritual resources of the papacy were placed at Charles's disposal: Martin excommunicated the rebels and contributed to Charles's war chest. When King Peter III of Aragon accepted the crown of Sicily, Martin not only excommunicated him but also declared a crusade against Aragon, which he persuaded the king of France to undertake. Thus, he committed the papacy to the Angevins in the war of the Vespers, which dragged on after all three principals died in 1285.

Martin IV was a capable professional administrator who was guided

chiefly by his patriotism and loyalty to his patrons. His besetting sin, according to Dante, was gluttony (*Purgatory*, 24.20-24).

Martini, Simone

The birthplace of the painter Simone Martini (c. 1284–1344) is unknown, but he must have been a citizen of Siena, for he is referred to as *de Senis*. We find no mention of Martini (as he will be called here, though he is often called simply Simone) in archival records before 1315. However, the year of his birth may be deduced from Vasari, who saw a memorial inscription in the church of San Francesco in Siena, according to which Martini died at age sixty. Martini's training is undocumented. He may have been a pupil of Duccio and may even have been one of several collaborators working on Duccio's *Maestà*; or, as Vasari wrote, he may have been a pupil of Giotto in Rome. Many scholars see in Martini's work the influence of the French courtly style, to which he may have been exposed during visits to Naples and Rome, where French culture thrived at the time. Martini married Giovanna, the sister of the Sienese artist Lippo Memmi, in 1324; he bought the house they lived in from Memmi. The couple had no children. After 1333,

there is no mention of Martini in Siena. By 1336, at the latest, he was in Avignon, where he remained until his death. Only his brother Donato, also a painter, and his wife traveled with Martini to France. The move may have been prompted by competition in Siena from the Lorenzetti brothers, who had been on the rise since c. 1328, or by an unrealized hope for papal commissions.

Siena, Naples, and Assisi (c. 1315-1320)

By consensus, the fresco of the *Maestà* (Palazzo Pubblico, Siena) is Martini's earliest dated work; it was probably completed for the commune in 1315-1316 and repaired in 1321. It shows the Virgin and Child enthroned beneath a canopy supported by some of the saints standing on either side. In the foreground, four saintly protectors of the commune kneel with two angels, who present bowls of flowers to the holy pair. A surrounding border contains images in roundels of God the father, prophets, evangelists, church doctors, and others. This fresco is a unique example of a dialogue between the Virgin and the kneeling saints. The Virgin's statements still remain inscribed on the step below her, but the prayers originally offered by the saints have disappeared from the scrolls that only two of them still hold. The sense of space, defined by the canopy, is noteworthy, as is the textured surface, which creates the impression of a tapestry and includes insertions into the plaster of colored glass and imitation gems, as well as the earliest examples of patterned halos.

The *Saint Louis Altarpiece*, tempera on panel (Naples, Capodimonte Museum) is signed. It was probably commissioned by Louis's brother, King Robert of Anjou, and shows angels crowning an enthroned Louis, while the saint himself deposits a second crown on a minuscule figure of Robert, kneeling at the right. It is datable between 1317, when Louis was canonized, and 1319, when his remains were translated to a new tomb in Marseilles in a ceremony attended by Robert, who returned to Naples with Louis's brain as a relic. Martini probably traveled to Naples to execute the picture. Louis's royal status is emphasized by the fleur-de-lis and other emblems on the frame and the saint's robe. The intricate tooling and use of glass, stones, silver, and gold lend the work

opulence. The narrative predella, the earliest of this form to survive, illustrates five events from the life, death, and miracles of Louis. Though the scenes are set in different architectural interiors, the intuitive perspective is synchronized in all five, with orthogonals moving toward the vertical axis of the central scene.

The narrative frescoes in the chapel of Saint Martin of Tours (Assisi, basilica of San Francesco) have been attributed to Martini since the nineteenth century for stylistic reasons. The commission was funded by Gentile di Partino da Montefiore, a Franciscan cardinal from the Marches who died in 1312. The paintings include ten scenes from the legend of Martin and many separate pictures of saints and angels, as well as a portrait of the donor kneeling before Martin. The cycle was probably painted after the donor's death in 1312 but before 1319, when a period of political strife in Assisi would have prevented artistic activity in the basilica. The dedication of an Italian chapel to Martin, a patron saint of France who was born in Hungary, is surprising. Perhaps the donor's education in Paris and a later trip to Hungary on a diplomatic mission inspired his choice. The pictures treat Martin's secular life, reign as bishop, death, and funeral. Their narrative sequence is unusual, moving from the bottom of the wall to the top. Though the space is shallow in all the scenes, whether set in architectural interiors or outdoors, the pictorial drama is clearly articulated through the gestures and glances of the figures—for example, a pauper in the first scene who grasps Martin's cloak. Also impressive are the facial expressions of singers and details of costume such as the colorful peaked hats from Hungary, both seen in *The Knighting of Saint Martin*. Some scholars believe that the frescoes illustrating the life of Saint Francis elsewhere in the basilica influenced Martini's style, both in the Saint Martin cycle and in his later work. Martini may also have been responsible for the three stained-glass windows in the chapel. These windows (of uncertain date) show Saint Martin and other figures. According to Vasari, the *Virgin and Child with Saints* and *Five Saints*, frescoes in the chapel of Santa Elisabetta in the basilica, were begun by Martini and finished by Lippo Memmi.

Siena, Orvieto, San Gimignano, and Pisa (c. 1320-1335)

The *Grieving Saint John* (Barber Institute, Birmingham), in tempera on wood, is dated 1320 but undocumented before 1932. The saint's emotions are beautifully expressed. This work is small in scale and was probably part of a triptych painted for a private patron.

The frescoed *Equestrian Portrait of Guidoriccio da Fogliano* (Siena, Palazzo Pubblico) is controversial. Documents show that *Simone dipintore* painted at least four pictures of castles in the Palazzo Pubblico in 1330 and 1331. Since *Guidoriccio* shows castles in the background, some scholars assume that it is among the documented pictures. However, the fresco was not mentioned by Ghiberti or Vasari, and it is not signed. Moreover, there are errors in the treatment of military details that lead some to conclude not only that the painting is not by Martini, but that it is later than the fourteenth century. A relatively recent discovery of a fresco containing a castle lower down on the same wall as *Guidoriccio* allows us to attribute that work to Martini in lieu of the disputed picture. But if *Guidoriccio* is by Martini, and the inaccuracies are due to sloppy restorations in later times, the fresco demonstrates the painter's innovativeness. The warrior, identified as Guidoriccio by his heraldry, rides alone immediately behind the picture plane, a broad landscape stretching far beyond him—an image without precedent in medieval secular palaces.

Simone Martini (1284—1344), *The Annunciation, with Saints Ansanus and Margaret*. Four medallions of prophets: *Jeremiah, Ezechiel, Isaiah, Daniel*. Tempera on wood, 265 by 305 centimeters. Uffizi, Florence. Photo: © Scala/Art Resource, N.Y.

The *Saint Ansanus Annunciation* (Florence, Uffizi) is signed by both Simone Martini and Lippo Memmi and dated 1333. It is painted in tempera on wood and is an early example of an altarpiece illustrated with a narrative scene. The work shows Saint Ansanus and an unidentified female saint (Margaret?) at either side and prophets in roundels. It was the first of four altarpieces for the cathedral of Siena, dedicated to the four saintly protectors of the city, one of whom was Ansanus. The frame was added in the late nineteenth century. The records of payment shed no light on the respective responsibilities of the two collaborators. Probably Martini painted the Annunciation and Memmi painted the two saints and the prophets. A fifth roundel most likely portrayed God the father. The Annunciation is noteworthy for its immediacy: Gabriel has just alighted, his cape still flying, while the Virgin recoils in fear. Elegant details include Mary's intarsia throne; the marble floor; and Gabriel's brocaded robe, plaid cape, and rose-tinged

wings. As in other Sienese Annunciations, Gabriel bears an olive branch instead of a lily. He also wears a crown of olive leaves. Symbolic of peace, these leaves perhaps allude to the coming of Jesus, the prince of peace. The words of Gabriel's announcement, *Ave Gratia Plena Dominus Tecum* (Luke 1:28), are in relief; they can thus be read metaphorically as the word that becomes flesh in Mary's womb at this instant.

The *Altarpiece of the Blessed Agostino Novello* (Siena, Pinacoteca Nazionale) is a tempera painting in an old-fashioned *pala* format. Though it is unsigned and undated, most scholars believe that Martini was the artist. It was painted for Sant' Agostino in Siena and was first documented in 1638, together with the sarcophagus of the Beatus (now lost) that it decorated. Agostino, a hermit monk who died in 1309 outside Siena, was venerated locally. The central panel of the altarpiece portrays him standing amid four trees, book in hand, an inspirational angel at his ear. The side panels illustrate four posthumous miracles—two drawn from Augustinian texts, two unrecorded. Each contains two episodes, a disaster followed by salvation. Three of the four stories show Agostino saving small children, an emphasis compatible with the protohumanism of the early *Trecento*.

Martini and his workshop painted other polyptychs, typically showing a half-length Virgin and child in the center flanked by panels containing busts of saints. At least two rested on a predella, and all apparently were crowned with gables filled with bust-length figures. The altarpiece painted for Santa Caterina in Pisa (Pisa, Museo Nazionale di San Matteo) and signed by Martini seems to have survived intact. The others, broken up and with many panels missing, apparently were painted as altarpieces for churches in Orvieto and San Gimignano.

Avignon (c. 1335-1344)

The frescoes originally in the porch of the cathedral of Notre Dame des Doms, Avignon, were probably commissioned by Cardinal Jacopo Stefaneschi (d. 1341). When the badly damaged fragments that survive were transferred to the museum of the Palais des Papes, up to three layers of *sinopie* were revealed. Two works are completely lost: *Andrea*

Corsini Healing a Blind Man, a portrayal of a miracle that took place in the porch itself; and *Saint George and the Dragon*, known through a seventeenth-century copy. The extant fragments and *sinopie* portray the earliest known Madonna of Humility and an adult Jesus with an orb flanked by six angels. In the former, the donor kneels before the Virgin, and the child holds a scroll inscribed "I am the light of the world"; in the latter, the unusual orb contains a landscape framed between rippling water and a starry sky. The changes in the skillfully drawn series of *sinopie* suggest that the patron played an active role in the artist's progress.

The *Holy Family* (Liverpool, Walker Art Gallery) is signed and dated 1342. This small picture in tempera is a unique portrayal of Jesus, Mary, and Joseph immediately after the disputation with the doctors in the temple. The codex in the Virgin's lap contains an abbreviated quotation from Luke 2:48—"Son, why hast thou dealt with us thus?"—and the gestures indicate a parental reprimand of the defiant Jesus. This work is an unusual example of the Holy Family as an ordinary family with ordinary problems; as such, it reflects the human values of the time.

The *Virgil Frontispiece* (Milan, Biblioteca Ambrosiana) was painted on vellum for Petrarch between 1338 and 1344. A couplet inscribed on it states that the artist was Simone Martini. This painting was made for Petrarch's volume of classical texts, which included most of Virgil; it originally faced the first work, a fourth-century commentary by Servius on the *Bucolics*. The image seems to be an allegory explained by two other couplets that refer to the "unveiling" of the "secrets" of Virgil by Servius. It depicts Servius pulling back a curtain to reveal a reclining Virgil; nearby are a knight (representing the *Aeneid*), a farmer (*Georgics*), and a shepherd (*Eclogues*).

Two lost portraits by Martini probably also date from the Avignon period. The first, made for Petrarch, depicted Laura; it is known only through two of the poet's sonnets that refer to it. The second was of Cardinal Napoleone Orsini, and to it Martini added verses by Petrarch, which appear to come from the sitter's mouth. It was mentioned in a fifteenth-century text. These were the first-known individual portraits in Italy.

The seven surviving tempera panels of the *Antwerp (Orsini) Polyptych* (Antwerp, Musées Royaux des Beaux-Arts; Berlin, Staatliche

Museen, Preussischer Kulturbesitz; Paris, Musée du Louvre) are dated by most scholars to Martini's years in Avignon. Originally a double-sided work, the polyptych probably folded like a concertina. The panels portray Gabriel, the Virgin Annunciate, and the *Via Crucis* (backed by the Orsini arms), *Crucifixion*, *Deposition*, and *Entombment*. One narrative panel and a second set of the family arms are lost. The patron, shown in the *Deposition*, was one of the four Orsini brothers, all of whom became cardinals. Most remarkable is the *Via Crucis*, which includes perturbed children; a rare depiction of Simon of Gyrene bearing the cross behind Jesus (Matthew 27:32); and a compassionate Saint John already protecting the Virgin, before Jesus asks him to do so from the cross. The polyptych was signed by Martini.

Saint Ladislav (Altomonte, Santa Maria della Consolazione, Museo), a small devotional panel in tempera known only since 1929, is attributed to Martini on the basis of style. It probably was made at Avignon. The veneration of Ladislav was rare in Italy at this time, and the portrayal of a saint standing in isolation was also unusual.

Other Lost or Destroyed Works

Account books in Siena mention other works done in the city but no longer extant. In addition, Ghiberti cites an altarpiece for the cathedral of Siena, now lost, and frescoes on the facade of the Opera del Duomo and the Ospedale della Scala, both destroyed. Finally, Vasari refers to an untraced panel in Santa Maria Novella in Florence.

Masegne Brothers

The brothers Pierpaolo (documented 1383, died c. 1403) and Jacobello (documented 1383, d. after 1409) dalle Masegne, sculptors and architects from northern Italy, were among the most important artistic personalities active in the Veneto and in Emilia at the close of the fourteenth century. They are best-known for their collaborative work on the marble altarpiece of San Francesco in Bologna (commissioned 1388) and the iconostasis, or choir screen, of San Marco in Venice (dated 1394) but they were also active in Mantua, Modena, and Milan. Scholars have tended to focus on determining the individual style of each brother, even though no documentary evidence has been found to substantiate the claim that Pierpaolo was largely responsible for the carving of the altarpiece in Bologna (which was actually commissioned from both), or that Jacobello played the leading role in the iconostasis in Venice (which is in fact signed by both).

The high altar of San Francesco, heavily restored, was carved from Carrara marble. It is complex in structure: two tiers of powerfully characterized activated figures are surmounted by slender finials; and the whole, which is framed by two polygonal end buttresses, rests on a predella comprising nine narrative reliefs. In shape and design the work is dependent on the traditions of *Trecento* painted altarpieces, especially Venetian, although its decorative exuberance invites parallels with ivory carving. Aspects of the figure style and facial types betray the influence of Nino Pisano; the dalle Masegne brothers would have known Pisano's Cornaro monument (Santi Giovanni e Paolo, Venice) if, as is believed, they spent their formative years in Venice, where their father Antonio had also been active as a stonemason. The figure types found in the brothers' other great commission, the San Marco

iconostasis, have greater expressive force, at least in the case of the apostles. Sharper in outline and crisper in finish, these dynamic statues engage more forcefully with the space around them.

The dalle Masegne, whose oeuvre is indebted both to Nino Pisano's suave style and to the more robust expressive force of contemporary transalpine art, left a lasting impact in northern Italy, in particular, but also in the Marches and parts of Tuscany, as Jacopo della Quercia's work in Lucca and the Riccomanni family's activity in Versilia testify.

Maso Di Banco

Although Lorenzo Ghiberti described Maso di Banco (Florentine, fl. 1320s-1340s) as "a man of the greatest talents" and credited him with a fresco cycle in the church of Santa Croce, the documentary evidence reveals very little about him, for there are no signed or dated works

from Maso's hand. He was almost certainly trained in Giotto's workshop and has been considered Giotto's closest follower. Recent attributions of sculpture to Maso, also based upon Ghiberti's comments, have been more controversial and are not accepted by some scholars. Maso's frescoes and panel paintings show his profound interest in volume and mass, but his figures do not follow Giotto's emphasis on inner psychological states. Maso's experimentation with pictorial space in his frescoes, and the use of a narrow frame format in his panels, particularly that of the Santo Spirito polyptych in Florence (c. 1340), can connect him with contemporary developments in Sienese painting.

Maso's best-known work is a fresco cycle depicting the legend of Saint Sylvester and Emperor Constantine (c. 1336–1340) in the Bardi-Bardi di Vernio Chapel of Santa Croce. Much of the repainting that had been done during the 1930s was removed during a restoration of the chapel in 1994–1998. The cycle is based on Jacobus da Voragine's *Golden Legend*, but the unusual choice of Saint Sylvester—the pope believed to have converted Constantine to Christianity—was possibly related to the Bardi family's financial ties with the papacy. The frescoes and stained glass in the chapel may also have delineated the role of the church and secular authority in the struggle against heresy. In the famous scene of Saint Sylvester and the Dragon, the saint seals the dragon's mouth and raises two magicians from the dead within a remarkable setting of crumbling walls, meant to evoke the ruins of the Roman forum.

In the same chapel, within the arch of an *avello*, or tomb monument, Maso also painted an individualized Resurrection and Last Judgment. The risen Christ appears solely for a member of the Bardi di Vernio family, who appears to be rising out of his marble tomb below. The donor clearly had no doubts regarding his salvation, and the fresco has been described as one of the most hubristic images of the period.

Since no records documenting Maso's activity have been found after 1348, he may have perished in the black death.

Massa Marittima

Massa was the ancient Etruscan center of a region rich in mineral deposits (iron, lead, silver, copper ores), but it had little municipal history of its own until the mid-ninth century, when the seat of the local bishopric (together with the relics of Cerbonius, an early sixth-century saint) was shifted there from Populonia, which had been destroyed by pirates (c. 835). Massa itself was destroyed by the Saracens in 935 but recovered and emerged by the early thirteenth century as an independent republic (1225-1335). In 1335, it came under Siennese rule, and not until 1555 did it pass to Florence under the Medici. Saint Bernardino of Siena was born in Massa in 1380. The town is divided into two principal parts: the old city (*città vecchia*) and the new city (*città nuova*). Both were enclosed by a thirteenth-century circuit of town walls. After conquering Massa in 1335, the Siennese constructed massive fortifications that divided the two parts of the city, and this new wall includes the Porta alle Silici, which is connected to the Torre del Candeliere by a long flying arch.

By the beginning of the fourteenth century, Massa's longstanding importance as a center for the mining of metal ores had reached its

peak. In 1310, the first code of mining regulations (*Codice minerario*) ever issued in Europe was promulgated by Massa, although by the end of the century such mining came to an end. In 1317, the first silver coin, the *grosso*, was minted, bearing the image of Saint Cerbonius.

Ambrogio Lorenzetti (fl. c. 1311-1348), *Maestà*. Palazzo Comunale, Massa Marittima. Photo: © Scala/Art Resource, N.Y.

Massa is distinguished by its medieval survivals. The *duomo*, dedicated to Saint Cerbonius, was begun early in the twelfth century, revised through the thirteenth, and completed in 1304, emerging as a notable monument synthesizing the Tuscan Romanesque and the Gothic. On the facade, the marble architrave above the main portal has a series of relief sculptures depicting stories from the life of Cerbonius. In the interior are a baptismal font (1267) carved by Girollo da Como; a crucifix from the workshop of Duccio; and, in a side chapel, a painted panel of the *Madonna delle Grazie* (c. 1316). Executed by a member of the workshop of Duccio di Buoninsegna (if not by Duccio himself), this panel represents the trimmed central part of an originally much larger

Maesta that once adorned the high altar. One of the treasures in the cathedral is the marble *Area di San Cerbone* (the tomb of Cerbonius), signed and dated (1324) by Goro di Gregorio; this masterpiece in the Sienese style has relief sculptures of episodes from the saint's life.

Adjacent to the *duomo* are the Palazzo del Podestà (c. 1230) and the Palazzo Pubblico (thirteenth-fourteenth centuries). The Palazzo Pubblico has a fine *Maesta* painted by Ambrogio Lorenzetti (c. 1335). It shows the Madonna and child enthroned with allegorical figures of the three theological virtues: *Fides* (faith), *Spes* (hope), and *Caritas* (charity). Each is seated on a massive, chromatically symbolic step (white for *Fides*, green for *Spes*, red for *Caritas*). Some elements of the composition (e.g., the rows of saints) are reminiscent of Duccio's *Maestà* in Siena (Museo dell'Opera del Duomo), but Lorenzetti was consciously reinterpreting his source material in an analytical manner, giving it a moralistic, theological meaning. His *Maestà* was originally commissioned by the Augustinian friars for the high altar of their church, Sant' Agostino, which was begun in the Romanesque style (1299–1313) and completed in the Gothic style in 1348. The impressive *fortezza*, dating from the period of Sienese control (1335 onward), now survives only in part.

Master of Saint Cecilia

See Saint Cecilia Master

Master of the Dominican Effigies

The painter and illuminator called the Master of the Dominican Effigies (fl. c. 1328-1350) was closely associated with the artistic milieu of early *Trecento* Florence, and especially with a "miniaturist tendency" (Offner 1987) that thrived there under Pacino di Bonaguida and his entourage. The oeuvre and identity of the Master of the Dominican Effigies are still a subject of scholarly debate. He is currently named after a panel, the *Enthroned Christ and Virgin Attended by Seventeen Dominican Saints* (c. 1336; Florence, Santa Maria Novella). In the early twentieth century, some of the work now associated with him was attributed to the Master of the Lord Lee Polyptych, identified by Osvald Siren in 1926; or to the Master of Terenzano, as proposed by Bernard Berenson in 1930–1931. Some scholars, taking a more controversial line, have argued that the art of two other *anonimi*—the Biadaiolo Master and the Master of the Cappella Medici Polyptych—or even the art of one documented artist, the illuminator Ristoro di Andrea (fl. c. 1334-1364), should be assigned to the Master of the Dominican Effigies. These hypotheses, however, have not all found wide critical acceptance.

The artistic personality of the Master of the Dominican Effigies appears to have developed in the orbit of Pacino, from whom he inherited an interest in small-scale panel painting and manuscript illustration, which are both suited to engaging narrative, pictorial precision, and charmingly characterized figures. Indeed, in the unusually large gathering of saints shown in the panel in Santa Maria Novella (the work after which he is named), an attention to glance and

gesture results in a cohesive figural grouping that is not lacking in animation despite the symmetrical arrangement. There is also a concern for pattern and ornamental detail, especially evident in the decoration of the gabled throne, its tiered supporting structure, and the rich cloth of honor. These precious qualities also exist in the coeval work of Bernardo Daddi, whose exquisite, gemlike portable altarpieces would have provided the master with an example to follow in this regard, and with regard to the quality of execution. The Master of the Dominican Effigies was evidently a prolific artist who headed a successful workshop, as the range of the commissions he received, especially in illumination, testifies.

Master of the Saint Francis Cycle

The fresco cycle in the upper basilica of San Francesco in Assisi depicting the legend of Saint Francis is one of the most important landmarks in the history of Italian painting. These frescoes, an early example of naturalistic painting on a monumental scale, have captured the imagination of viewers and artists for centuries. Yet the cycle is also one of the great mysteries of the Italian Middle Ages. Problems surrounding the work have hounded historians for centuries, and neither the identity of its artist (or artists) nor the date of its execution has been confirmed by modern scholarship. Relatively recently, specialists have proposed that the project was executed c. 1300 by a team of anonymous artists, one of whom has been dubbed the Master of the Saint Francis Cycle.

The *Legend of Saint Francis* appears on the lower nave walls of the upper basilica, directly below a series of biblical scenes executed in the early 1290s by the Roman painter Jacopo Torrid. The Saint Francis cycle is arranged in twenty-eight scenes that wrap around the church from one side of the transept to the other and recount the life and miracles of Francesco Bernadone (d. 1226), the merchant's son who initiated the mendicant order bearing his name. Francis is depicted as a humble man, pious in his devotion to Christ and subservient to the papal authority in Rome. Throughout the cycle, figures and spaces are produced with an energy, vibrancy, and naturalistic verve that were clearly innovative,

The lack of any archival references to the cycle and its painters has allowed popular myth to dominate scholarly interpretation. Tradition has long held that Giotto painted the *Legend of Saint Francis*. Ghiberti appears to support this idea when he states in his *Commentari* that Giotto "painted in the church of Assisi . . . , almost all of the lower part" (*dipinse nella chiesa d'Assiesi . . . quasi tutta la parte di sotto*). This remark, while seemingly clear enough, is actually rather ambiguous when one remembers that San Francesco has both an upper and a lower basilica. The *parte di sotto* that Ghiberti mentions could be interpreted as either the lower part of the nave in the upper basilica—the *Legend of Saint Francis*—or the numerous frescoes decorating the lower basilica,

some of which indeed seem to have been executed by Giotto's workshop c. 1310. Vasari is much more specific: he claims that Giotto was the artist of the Francis cycle (which he erroneously describes as having thirty-two scenes). However, his interpretation appears to have been driven both by his reading of Ghiberti's phrase and by his own propagandistic Florentine interpretation of Italian art history.

The words of these early critics have had an extraordinary impact on modern scholarship. Until quite recently, Giotto was almost unanimously identified as the painter of the Saint Francis cycle, and proponents of this view have usually found enough visual evidence to identify the forms and figures as examples of Giotto's "early style." Recent publications have called this interpretation into question, however. The visual evidence indicates that the Saint Francis cycle was painted sometime after 1297 and probably before 1307. Given the fact that Giotto worked in Padua between 1304 and 1306, when he was fully mature, and lived in Rome immediately before or after this period, one wonders if the great master would have had time for an extensive stay in the hinterlands of Umbria. Moreover, the stylistic discrepancies between the Saint Francis cycle and Giotto's paintings in Padua are great enough to cast doubt on the idea that the works in Assisi represent Giotto's early style. If this claim is correct, then Giotto dramatically, and inexplicably, altered his pictorial vocabulary in Padua in the span of only two or three years. Many scholars now argue that the Saint Francis cycle was not painted by Giotto at all, but rather is the work of anonymous masters who were familiar with his proclivities.

School of Giotto di Bondone (1266-1336), *Saint Francis Renounces His Worldly Goods*. Fresco. San Francesco, Assisi. Photo: © Scala/Art Resource, N.Y.

However, no known artists have been offered as suitable alternatives. Current theories revolve around the concept that a team of painters worked on the twenty-eight scenes simultaneously. Three stylistic hands have been identified in the cycle, one of which is attributed to an anonymous artist known as the Saint Cecilia Master (owing to affinities with a panel in the Uffizi in Florence). This master is usually credited with scenes 1, 26, 27, and 28. A second painter—the one called the Master of the Saint Francis Cycle—is often thought to have painted scenes 2 through 19, which include *Francis in San Damiano* and the *Renunciation of Worldly Goods*, *Dream of Innocent*, *Miracle at Greccio*,

and *Stigmatization of Francis*. The remaining six scenes are attributed to a third anonymous artist. Of the twenty-eight scenes in the program, those produced by the Master of the Saint Francis Cycle are the most important, owing to their innovative designs and to the influence they seem to have had on other *Trecento* painters.

Although this master apparently has a naturalistic style usually found in the work of Florentine painters, a number of pictorial features suggest a Roman heritage. The depiction of architecture, the handling of figures and faces, and the repeatedly favorable representation of the papacy (and Rome) throughout the cycle suggest that the Master of the Saint Francis Cycle was well versed in the stylistic vocabulary of Pietro Cavallini and his Roman peers.

The scenes making up the *Legend of Saint Francis* and the artists responsible for their execution influenced nearly every important painter of the early *Trecento*, including Giotto, Duccio, and the Lorenzetti brothers. Artists throughout the century appropriated the physical and psychological appearance of the figures, particularly those executed by the Master of the Saint Francis Cycle. The Master of the Saint Francis Cycle, whose productivity outside Assisi is completely unknown to us, must be recognized as one of the most powerful and effective painters of the Italian Middle Ages.

Matilda, Countess of Tuscany

Countess Matilda of Tuscany (1046–24 July 1115), is sometimes known as Matilda of Canossa after the chief fortress of the dynasty. Her father was Margrave Boniface III (d. 1052); her mother was Beatrice, daughter of Duke Frederick of upper Lotharingia (d. 1033). In 1054, the widowed Beatrice married Duke Godfrey the Bearded of Lotharingia (d. 1069), whose brother later became Pope Stephen IX (r. 1057–1058) and who was a frequent opponent of Emperor Henry III (r. 1039–1056). This marriage was a major reason for Henry's successful campaign of 1055, when Godfrey was forced to flee to the north and Beatrice and Matilda were taken as captives to Germany. To cement an alliance between Lorraine and Tuscany, Matilda was engaged to Duke Godfrey the Hunchback of Lotharingia—son of her stepfather from his first marriage—even before their return to Italy (1056). The marriage, which eventually took place in 1069, seems to have been unhappy from the start; a son, whom Matilda never recalled in even a single one of her many pious donations, died shortly after a difficult birth. In 1071, she separated from Godfrey the Hunchback and returned to her mother in Italy. With her mother, Matilda governed as the only heiress of the imperial fiefs and family allods (an allod, or allodium, is an estate held in absolute ownership) in Tuscany, Emilia, and Lombardy.

Mother and daughter, but especially Matilda, became fervent supporters of Pope Gregory VII (r. 1073–1085), and of the reformed papacy in general. Nine letters in Gregory's register are addressed to them, and when Gregory proposed a crusade, he envisioned himself at the head of Christian knights in the company of Matilda, Beatrice, and Empress Agnes, the widow of Henry III. In the fight against Henry IV—who obtained absolution from his excommunication by Gregory VII in January 1077 at Matilda's fortress of Canossa—Matilda acted at first as an intermediary, through eventually became a determined military opponent of Henry. Under an imperial ban from 1082 on, Matilda suffered important territorial losses, largely because of the opposition of her own vassals to her policies, which included support of the Pataria in Milan and Piacenza. Nevertheless, she was able to defeat Henry IV in 1092 and never once wavered in her adherence to the papal cause.

Gregory VII had dissuaded her from entering a convent after the death of Godfrey the Hunchback (1076); and in 1089, at the urging of Pope Urban II (r. 1088-1099), she married the seventeen-year-old Welf II of Bavaria (duke, 1101–1120). Welf separated from Matilda in 1095. In 1079, she made the Holy See her sole heir, but evidently with the right not only to usufruct during her lifetime, but also to further alienations and additional dispositions. She confirmed this grant in 1102, but also concluded an agreement in 1111 with Emperor Henry V, who henceforth appeared as her heir. The resulting quarrel over the Matildine lands was finally settled in favor of the curia under Emperor Frederick II Hohenstaufen (r. 1212–1250).

Matilda died at Bondeno, near Ferrara, and in accordance with her wishes was buried at the Abbey of San Benedetto di Polirone near Mantua. In 1634, Pope Urban VIII transferred her remains to Saint Peter's in Rome. Her tomb, designed by Bernini, depicts Henry IV's submission to Gregory VII at Canossa in the presence of Matilda.

Matteo D'Acquasparta

Macteo d'Acquasparta (c. 1237—29 August 1302) was a Franciscan theologian and cardinal and served as minister general of the Franciscan order from 1287 to 1289. He was descended from the powerful Bentivenghi family. Matteo joined the Franciscans c. 1254, was educated at the order's convent at Todi, and was then sent to Paris to study theology. He received his baccalaureate in 1268 or 1269, commented on the *Sentences* from 1270 to 1273, and was awarded a

doctorate in 1273. After lecturing at Bologna, Matteo returned to Paris in 1276 as regent master of the Franciscan *studium*. In 1279, he moved to the papal curia—where his brother was a cardinal—to serve as lector of the Sacred Palace. Eight years later he was elected minister general of the Franciscan order.

Severe tension between the Franciscan Spirituals and Conventuals dominated Matteo's brief generalate. His attempts to achieve equilibrium included freeing many Spirituals who had been in various forms of detention, among them the former minister general John of Parma. Matteo also brought a quick resolution to the long investigation of the prominent Spiritual theologian Peter Olivi for heresy. After Olivi was acquitted, Matteo appointed him to the chair of theology at the Franciscan *studium* of Santa Croce in Florence. In 1288, Matteo was made a cardinal; during the next year he left his generalate to direct the Sacred Apostolic Penitentiary.

Matteo became a very important figure at the curia during the reign of Pope Boniface VIII. Between 1297 and 1301, Boniface entrusted him with a series of delicate peace negotiations in northern Italy. In 1302, at a critical point in the pope's struggle with the French, Matteo was chosen to set forth the pope's position on papal authority to the legates of Philip the Fair. Later that year Matteo assisted in the drafting of *Unam sanctam*, Boniface's controversial bull defining the extent of the pope's power over the temporal sphere. Matteo died while *Unam sanctam* was still in preparation.

Matteo was an Augustinian in his philosophical and theological orientation and showed the strong influence of Bonaventure. His philosophical work reflects an interest, typical of his period, in the relation of the natural to the supernatural. His theory of cognition, which artfully blends Aristotelian concepts of the potential and agent intellects with the Augustinian notion of divine illumination, is considered one of the more original early attempts at a synthesis of Augustinian teachings with Aristotle.

Matteo Da Perugia

Matteo da Perugia (Matheus de Perusia, d. by 1418) was born in the latter fourteenth century and belongs, officially, to the third and last generation of Italian *ars nova* musicians; however, his curious career and his stylistic focus make him almost a French musician.

Except for his presumed Perugian origin, we know nothing of Matteo's early life, although it is apparent that he chose to become a professional musician rather than a priest. At some point, he became a singer at the cathedral of Milan (which was then still unfinished), and in 1402 he was appointed to be its first choirmaster (*magister capellae* or *maestro di cappella*). This appointment is thought to reflect the influence of the colorful man who became Matteo's chief patron, Pietro Filargo di Candia (Petros Philargos). Pietro Filargo was born a Greek; joined the Roman church; studied and then taught theology at the University of Paris; was an adviser to Gian Galeazzo Visconti; was

made bishop, successively, of Piacenza (1386), Vicenza (1387), and Novara (1389); became archbishop of Milan in 1402; was made a cardinal in 1405; and became the antipope Alexander V in 1409.

Filargo took up his episcopal residence in nearby Pavia, where he could teach at its university and hold a lavish court. Matteo, loyally, came to this court to serve Filargo, so annoying his own employers in Milan that he felt compelled to give up his cathedral post in 1407 and devote himself fully to Filargo. In 1409, when Filargo was elected as antipope Alexander V by the Council of Pisa, Matteo presumably moved with his master to a new residence in Bologna. It was apparently then that Matteo participated in the preparation of one of the most important musical manuscript collections of the day (now in the Estense Library in Modena). When Alexander V died in 1410 (by poison), Matteo evidently stayed on with his successor, John XXIII, until John was assured of deposition by the Council of Constance. In May 1414, Matteo resumed his post at the cathedral in Milan, officially until October 1416. However, but not until January 1418—by which time Matteo himself seems to have died—was his successor given full status as *maestro di canto*.

There is no evidence that Matteo himself ever visited France, but French cultural influences had been present in northern Italy for decades, thanks partly to the proximity of the absentee papal court at Avignon. Filargo's Francophile tastes, in particular, probably caused Matteo to develop an identification with French rather than Italian musical styles—whether by imposition or voluntary affinity. Matteo's output of compositions must have been extensive, and what survives of it, though small by some standards, is the largest of any of the Italian *ars nova* composers. Aside from some six Latin liturgical pieces (two of them complex polytextual motets), the surviving works are secular. Only two *ballate* are in Italian. The remainder (four *ballades*, seven *virelais*, ten *rondeaux*, and one canon) are all in French, presumably to suit the Francophile tastes of his patrons. Most of Matteo's compositions are for three vocal parts, and in virtually all his work—sacred or secular—he applies the arcane techniques of isorhythmic integration, carrying them to elaborate extremes (disjunct lines, conflicting time signatures, etc.) in the style of the so-called *ars subtilior*, the "mannerist" school of exaggerated effects, which he seem to have embraced wholeheartedly.

Indeed, Matteo, along with Antonello da Caserta, was a leader of this imported stylistic movement.

Beyond his own authenticated compositions, there survive a number of substitute contratenor parts written for music by other composers. If these parts are indeed by Matteo, as is generally believed, they show him attempting, through these substitute voices, to update or enhance the work of earlier or contemporaneous masters (such as Machaut, Bartolino da Padova, and Antonello). It has been proposed that Matteo's supposedly "modern" style made him an important shaper of new musical directions for the *Quattrocento*; but there is also an argument against this idea, buttressed by the fact that Matteo's music survives in only a few manuscripts and apparently did not circulate widely. For all his fascination as a bold compositional personality, Matteo seems to have played a less significant role than the more focused and disciplined Johannes Ciconia in the transition from the age of Machaut to the age of Dufay.

Maurice, Emperor

The Byzantine emperor Maurice (Mauricius Flavius Tiberius; c. 539-602, r. 582-602) was of Armenian origin. An able and strict general, Maurice rose to high command in the east under Emperor Tiberius II (r. 578—582). Having no heir, Tiberius made Maurice his successor.

Maurice inherited a situation in which the surviving Roman empire faced war on several fronts simultaneously. Temporizing on the others, he concentrated first on the conflict with Persia, until a fortunate conclusion of peace (581) allowed him to focus on the Balkan regions, where the Avars and their Slavonic subjects had pierced the Danubian frontiers, requiring prolonged counteroffensives.

Though the emperors of this era were forced to devote themselves ever more narrowly to preserving the empire in the east, Maurice nevertheless gave careful attention to the western holdings, and it was in his reign that the organizational form of the exarchate came fully into existence: that of Carthage for North Africa in the face of the Moors and Berbers, and that of Ravenna in Italy in view of the Lombard menace there. The Lombards, who had invaded much of northern and central Italy in 568, were initially fought to a temporary

stalemate—with the aid of the Frankish king Childebert. The Lombard kings Authari (r. 584-590) and especially Agilulf (r. 591-616) then regained the initiative, and Agilulf, together with his subordinates, extended the devastation of contested territories as far as the gates of Rome. Pope Gregory the Great (r. 590-604) was on bad terms with Maurice—he resented Maurice's backing of pretensions by the patriarch of Constantinople, and they were at odds over monastic issues—and thus found it difficult to secure a stable defense. Nevertheless, by expanding the command structure, garrisoning cities, and augmenting forces, Maurice's government was able to maintain a precarious security in Italy for the rest of his reign.

In 597, a serious illness prompted Maurice to write a will in which he proposed to divide the empire between his two sons, assigning the western districts to one of them. He recovered however, and the scheme was put aside. Though Maurice was conscientious and capable, his propensity for harsh economies and unwise appointments prompted a military mutiny in 602 that swept him out of power. He and his sons were brutally executed by his rough successor, Phocas.

Mazzeo Di Ricco Da Messina

Nothing is known about the life of the poet Mazzeo di Ricco (thirteenth century), except that he was probably from Messina. He is the author of six refined *canzoni* in the Provençal tradition, but he probably belongs to the generation of poets who kept writing after the death of Emperor Frederick II (a patron of poetry) when Frederick's court ceased to exist: Guittone d'Arezzo (born c. 1235), dedicates one of his *canzoni* to *Mazeo di Rico ch'è di fin pregio rico*. This citation by Guittone d'Arezzo confirms the name Mazzeo di Ricco (or Rico), which is rhymed with the adjective *rico*; this would exclude an attempt by Torraca (1902) to identify Mazzeo with a certain Matteo de Riço. Mazzeo di Ricco also left a sonnet serving as a forum for the discussion of a moralizing topic: the need to know one's own shortcomings before blaming others.

Medici Family

The prominent position of the Medici in Florentine politics, business, and finance during the fifteenth century was preceded by more than 200 years of the family's presence and activity there. Much of the early history of the Medici is known from a book of *ricordanze*, or records, compiled by Foligno di Conte de' Medici in 1373. Foligno's first cousin, Averardo, was the grandfather of Cosimo de' Medici, the most famous fifteenth-century member of the family.

The ancestral origins and unsevered roots of the Medici were in the Mugello, a mountainous but also agriculturally rich region some 20 miles (32 kilometers) north of Florence. Members of the family probably moved to Florence sometime in the twelfth century. The earliest documentary reference to the Medici there is in 1216, when a certain Bonagiunta de' Medici served on a communal council. Apart from this, the Medici did not achieve considerable political visibility until the end of the thirteenth century and the early decades of the fourteenth. Between 1291 and 1343, the Medici served twenty-eight times in the *signoria*, the highest executive body in Florence. In 1343, they participated in a revolt against Walter VI of Brienne, the so-called Duke of Athens, and thereby earned additional political respect. Between 1343 and 1378, the family was represented nineteen times in the *signoria*, a number that was exceeded only by the powerful Strozzi family. Several decades later, however, the Medici were on the losing side of the populist *ciompi* revolt (1378), and they accordingly found themselves out of favor with the more aristocratic regime that came to power in 1382. As the political fortunes of the family fluctuated considerably in the fourteenth century, its members also gained a reputation for both litigation and lawlessness. The Florentine archives preserve a rather colorful record of quarrels, assaults, and even homicides perpetrated by various family members. In fact, between 1343 and 1360, five Medici were sentenced to death for capital crimes, although they were not executed. The political fortunes of the family rose once again in the early fifteenth century under the stewardship of Giovanni di Averardo de' Medici, whose better-known son Cosimo would head the family until his death in 1464.

In the early fourteenth century, the Medici began to establish their business interests in banking and commerce. Not until mid-century, however, did these interests extend beyond the Italian peninsula and provide the basis for the family's sizable fortune. In Florence, the Medici initially located their homes and business interests in the *mercato vecchio* ("old market," now the area of the Piazza della Repubblica). In the mid-fourteenth century, they transferred their residence to a more spacious palace on Via Larga (now Via Cavour) in the area between the cathedral and the church and monastery of San Marco. This first Medici palace (now destroyed) was superseded in the midfifteenth century when Cosimo de' Medici built a new and much larger palace in the current Renaissance style.

Medicine

The history of ancient and medieval medicine is known to us largely from the study of texts. During the Middle Ages, the writings of ancient authorities were read, copied, and translated by people who interpreted these works in the light of their own cultures and elaborated on them for the purposes of teaching and study. Medieval Italian medicine, unlike its counterparts in England or northern France, was never divorced from ancient textual roots, even though the ability to read

Greek was largely lost in the medieval period. This medicine also enjoyed the patronage of the Roman church and later that of the university and municipality. In short, learned medicine flourished in medieval Italian cities as nowhere else, from its beginnings in southern Italy to the great universities of Bologna and Padua.

Hippocratic Medicine

Learned medicine in western Europe had its beginnings with the Hippocratic physicians, whose writings can be dated c. 430-330 B.C. The existence of a historical person called Hippocrates is questionable, but it is certain that a group of healers began to distinguish themselves in ancient Greece at about the same time as the philosophers Socrates, Plato, and Aristotle began teaching. The Hippocratic corpus of texts is remarkable because these texts represent the first known attempt in the west to write medicine down. This was certainly done for didactic purposes, but other factors also seem to have been at work. The Hippocratics, like other ancient Greek philosophers, evidently used writing for persuasion: their texts were arguments, i.e., arguments for the superiority of their medicine over that of others, who have left no written record.

The Hippocratic physician, like the philosopher, claimed that his medicine was rational and had a long and honorable history. Other forms of healing, he argued, were based on superstition or mere hearsay. He was at great pains to dispel any notion that his medicine was irreligious; indeed, many Hippocratic texts recommend resorting to temple healing, a popular religious practice, when other measures failed. What lay at the bottom of most Hippocratic writing was not a glimmering of modern "objective" science, as has often been suggested. Instead, the Hippocratic physician argued that he had a special knowledge not granted to other men, knowledge that was a result of study, and thus required an experienced teacher. The Hippocratic physician, unlike other healers, could offer rational rather than magical explanations for disease. In addition, his piety and his study made him like a philosopher, rendering him more virtuous than the common person.

Hippocratic physicians were not writing just for other physicians; they were attempting to persuade patrons that their medicine was, among the many competing medicines, the one most worthy of patronage. There is good evidence that this persuasion took the form not only of the written word, but also of the spoken word. Hippocratic physicians seem to have debated other healers in public, and this agonistic or argumentative character of learned medicine joins philosophical rationality, moral virtue, and teachability as an essential quality of learned medicine in both the ancient world and the medieval world.

Galen and Roman Medicine

Aristotle's writings mention medicine in passing, and these bits of wisdom were gathered by medieval schoolmen, but Aristotle never devoted a treatise to medicine *per se*. It was the Greek physician Galen (died c. A.D. 210) who made medicine a worthy subject for advanced philosophical study. Galen came from Pergamon in Asia Minor and began his career in Rome with the unglamorous task of treating injured gladiators. He seems to have made a place for himself in imperial circles very soon after that, and he ended his life as physician to Commodus, son of the Stoic emperor Marcus Aurelius.

Galen wrote in Greek, then the language of philosophy, which was understood by every educated Roman. He stands as the foremost interpreter of the Hippocratic corpus, but his contribution goes beyond textual scholarship. Galen took up where Aristotle had left off by supplying medicine with a philosophical basis that would endure into the Renaissance. He also gave physicians arguments that allowed medicine to take its place among the liberal arts—those activities worthy of a free man.

Galen argued that the best physician was not only a philosopher but also a philanthropist, giving learned advice about the welfare of the body without charge. No one but a gentleman could afford to lead a life of genteel retirement, and it was to the Roman gentleman, the Stoic *paterfamilias*, that Galen directed his remarkable rhetorical powers. His public anatomical demonstrations were fabled (by his own account), as

were the scope and volume of his writings. Galen's work ranged over medicine, surgery, pharmacy, and Neoplatonic philosophy; he was the most prolific writer of western antiquity.

If the gigantic size of Galen's oeuvre seems excessive to modern eyes, one must understand the obstacles to his success, obstacles that were not ultimately to be conquered for more than a millennium. Galen had to argue not only against rival healers who claimed that medicine was easy and could be learned in a few months but against the entrenched opposition of the philanthropic Roman gentlemen themselves. From the time of the republic, stern-minded worthies such as Cato the Censor, Seneca, Cicero, and Pliny the Elder had asserted that the philosophical medicine of the Greeks was vain, unnecessary, and a threat to Roman manhood. A few simple herbs, known since early times, were all the medicine one needed; philosophizing about the body was, in a word, decadent.

Apart from a suspicion of all things Greek and a general distrust of any sort of intellectual "specialization," the Roman intellectual elite did not share with the Hellenic society an interest in physical culture. Gymnastics was for some Greek thinkers a liberal art, but the Romans idealized the lifestyle of the mature gentleman farmer, with his wife, children, relatives, and servants, over the community of clever athletic young men cultivated by the ancient Greeks. It was the medieval university, not the Roman ruling class, that adopted and extended Galen's bold plan for the philosopher-physician.

Christian Attitudes toward Medicine

Galen had been impressed by the presence in Rome not only of the educated and philosophically minded Jews, but also of a new sect, the Christians. The ultimate success of Christianity, both as a religion and as an organizing force in society, was to shape the character of learned medicine throughout the medieval period.

The three great religions of the medieval west—Judaism; Christianity; and, from the seventh century of the Christian era, Islam—were all religions of the book. Organization and criticism of texts were intrinsic to the thought of educated persons, and this method extended to more

secular writings as well. Saint Augustine of Hippo had enjoined Christian educators to "spoil the Egyptians" in his great work *On Christian Doctrine*, by which he meant that good teachers should select from the writings of the pagans the best and most useful, just as the children of Israel, after being captives in Egypt, were instructed to despoil the Egyptians of their gold and silver. Pagan learning, then, like that of Galen, needed to be examined from a Christian point of view, and this examination could best be performed only by the virtuous Christian man.

Augustine's theories of Christian teaching were realized in the sixth century by the Roman senator Cassiodorus, who founded monastic communities at Monte Cassino and Vivarium for the purpose of Christian study and reflection. Not surprisingly, the aristocratic Cassiodorus seems to have been more impressed with the paterfamilias model of simplicity and paternal medical care than with the Galenic one of philosophical inquiry. Cassiodorus, like Pliny before him, incorporated medicine into encyclopedic learning in his instruction for monastic textual study. Pliny, in his *Natural History*, wrote down what every virtuous gentleman ought to know. Cassiodorus, in his *Introduction to Divine and Human Readings*, directed his monks not toward gentlemanly study but toward the use of written knowledge for Christian purposes. He also instructed his monks to learn the uses of simple herbs and the techniques of the compounding of drugs, and to place their trust not in worldly medical advice but in divine counsel. Among the books he recommended were herbal writings by Dioscorides and Hippocrates, and Galen's *Therapeutics*, all in Latin translation (*Introduction*, 1.31).

The life of study and retirement adopted by the aristocrat Cassiodorus and his followers was to provide the home for learned medicine throughout the social and cultural disruptions that followed the decline of Roman authority. Various other monastic communities, such as the Benedictines and those which adopted a similar rule, assumed the same attitude as Cassiodorus—that medicine was part of an encyclopedic knowledge of the created world, but was not to be pursued at the expense of religious occupations. The Roman church became the ally and promoter of such learning, which was confined largely to a limited circle and had almost no audience outside the

monastery.

The School of Salerno

By the late eleventh century, southern Italy was also the site of western Europe's first medical university, the "school of Salerno." The presence of the celebrated Benedictine monastery at nearby Monte Cassino was no doubt a factor contributing to the establishment of such an institution. Constantinus the African, a monk at Monte Cassino in the mid-eleventh century, made translations of Islamic medical texts that provided the textual basis for medical teaching. Greek medical learning had largely been lost to the west after the decline of Roman authority, but it was understood and cultivated in Islam. Constantinus, an Islamic convert to Christianity, rendered into Latin Islamic interpretations of the Hippocratic corpus and the works of Galen, which joined translations of the writings of Hebrew and Byzantine physicians to form an early corpus of Latin texts that were to endure in medical universities well into the printed tradition.

Salernitan medicine was methodist in character: it was concerned with practical and methodological matters, and not with theory. Salernitan texts are, for the most, part guides to diagnosis and treatment, accompanied by simple descriptions of anatomy and physiology. The practical nature of Salernitan medicine reflects the secular character of the physicians associated with the university. Some appear to have been married men. One, sometimes called Trotula, was a woman, and she seems to have been one of many "Salernitan women" who were famous for their knowledge of learned medicine. Salerno was not a university in the usual sense, in that it lacked other faculties apart from medicine. It seems, instead, to have been organized by practicing physicians who wanted to use medical texts to improve their skill in healing arts, especially pharmacy.

The Rise of Northern Italian Medical Faculties

Scholastic medicine in Italian universities did not become prominent

until the thirteenth century, when the fame of the school of Salerno was fading. By then, the *Canon* of the great Persian physician Avicenna was available in Latin translation. Avicenna's skill as a physician was equaled only by his ability as a philosopher. The *Canon* combined a brilliant grasp of Galenic medicine, surgery, and pharmacy with a subtle understanding of the philosophy of Aristotle. Avicenna supplied arguments for scholars that medicine was indeed a part of natural philosophy, and that the physician himself was a man of dignity, virtue, piety, and learning, as he was in Islam.

Italy's first great medical university was at Bologna, and it educated both physicians and surgeons. Medical teaching also took place at a university in Padua; in Parma, Siena, and Florence; and in other urban centers. Medical teaching in northern Italy stood in contrast to that at northern European universities. Medicine at Paris, Oxford, and Cambridge was taught as one of the "higher," or graduate, faculties (the other higher faculties being theology and law). The liberal arts were taught in a "lower" faculty and were propaedeutic to medical studies. At Bologna and Padua, medical and arts studies (which included natural philosophy) were allied at the higher and lower levels, and the medical professors and students were closely integrated into town medical practice. Medical professors were often paid by municipal authorities, delivering opinions on matters of public health, hospital administration, and epidemic disease. These professors—in contrast to their counterparts at northern European universities—were not, as a rule, clerics. Some were married, and many obtained great wealth, prestigious patronage, and a high social position.

The success of learned medicine in medieval Italy was due to an interaction of complex factors that can be only imperfectly understood. The geographic location of Italy at so many cultural crossroads no doubt played a role, as did the interest of the church in nearly all kinds of learning. But perhaps the most important factor was the success of Italy's city-states themselves, which provided a ready source of civil patronage. The university-educated physician was, at last, a man of importance, whose opinions had an effect on the lives not only of the social elite but also of the humbler classes.

Meditation on the Life of Christ

Meditation of the life of Jesus was a devotional practice that originated in the twelfth century and grew in popularity throughout the later Middle Ages. In the early medieval period, Christ was pictured primarily as the divine conqueror of sin, death, and the devil. In the eleventh and twelfth centuries, however, the humanity of Christ came to be emphasized to a greater degree, largely owing to the popularity of the new theology of satisfaction developed by Anselm of Canterbury. Anselm's doctrine gave the crucifixion the central place in the history of Christian salvation and drew increasing attention to the sacrifice and suffering of Christ. Contemporary preachers and devotional authors sought to elicit from their audiences strong emotional responses to these aspects of Christ's life, hoping to draw them to penitence and, gradually, to the higher planes of spiritual love traditionally pursued in western spirituality. The goal here was the "imitation of Christ"—conformation to the image of Christ (Romans, 8:39) and the sharing in the mystery of redemption this imparted. Continued meditation on the events of Christ's life was considered vital to this process.

During the twelfth century, Cistercians like Bernard of Clairvaux

were the most prominent proponents of the new devotion. In the thirteenth century they were joined by the Mendicant orders, especially the Franciscans. Francis of Assisi himself attempted a very literal imitation of the life of Christ, and he became the most important promoter of devotion to Christ's humanity in the later Middle Ages. Francis's focus was on the concrete details of Christ's life, and on the virtues contained in those details. His followers continued this tradition during the late thirteenth century and the fourteenth century, producing classic works on meditation such as Bonaventure's *Lignum vitae*, Jordan of Saxony's *Vita Jesu Christi redemptoris nostri*, and the anonymous *Meditationes vitae Christi*.

Throughout the later Middle Ages, meditation on the life of Christ centered on Christ's passion. Spiritual writers attempted to evoke its physical details, intensifying their readers' interest in associated relics like the crown of thorns and in pilgrimages to the sacred sites. Religious art, too, became filled with realistic depictions of the passion. By the fourteenth century the stations of the cross had emerged as a popular devotional practice, and the liturgical cycle included a large number of feasts commemorating aspects of Christ's suffering.

Melania the Younger

In the late fourth century, aristocratic Roman society was undergoing a dramatic transformation. The old families who had been most loyal to Roman paganism were beginning to adopt Christianity. Eastern ascetic Christianity was becoming popular in Rome, particularly among the women of the wealthy families, and this ascetic movement was to influence the development of the western church. Melania the Younger was one woman at the center of these developments.

Melania was born c. 385 into the oldest and richest of Roman families. Through her father (Valerius Publicola) she was a member of the *gens Antonia* and the *gens Valeria*, and her mother (Albina) was almost equally well descended as a member of the *Ceionii Rufii*. In 399, Melania married Valerius Pinianus—a marriage arranged to bring together two branches of the *Valeria* and provide a succession for the name and wealth of the family. These traditional Roman expectations clashed with new Christian aspirations. Melania and Pinian's two young children died, and Melania then persuaded Pinian to embrace a life of chaste, ascetic Christianity.

The couple began to liquidate their vast assets of land, gold, and slaves to embrace a life of holy poverty. Divestments on this scale profoundly affected the Roman economy. The liquidation was facilitated by the Visigothic invasion of Italy of the early fifth century.

Melania and Pinian fled to Sicily and then to North Africa, where they endowed monasteries and ransomed captives from the invading Visigoths. After seven years in North Africa, the couple went to Jerusalem, where Melania established many monasteries for men and women on the Mount of Olives.

Melania was involved with several religious developments of the late fourth century. She seems to have been attracted to Pelagianism and supported the heretic Pelagius in North Africa. She also was an adherent of Monophysitism. She supported the growing ascetic movement in Rome and the Holy Land. Finally, her example of Christian piety within the oldest Roman families encouraged others to convert. Wealthy, ascetic women like Melania shaped fourth-century Christianity in Italy and throughout the Mediterranean world.

Melfi

Castle, Melfi. Photograph courtesy of John W. Barker.

Melfi, a city in Basilicata about 4 miles (6 kilometers) east of the Ofanto River, is first documented in eleventh-century chronicles. The Greeks recognized its strategic importance and had settled it by 1041, when the Normans occupied and fortified it. Norman leaders met there in 1043 to apportion their conquests in southern Italy. Melfi was left as a communal seat, but later it was annexed by Robert Guiscard, who built the cathedral and the castle. Its first bishop is attested to in 1059, when the synod of Melfi was held there. Robert later moved his headquarters to Salerno, but Urban II held a general council in Melfi in 1089, as did the antipope Anacletus in 1130. Melfi was severely chastised by Roger II for rebellion in 1133, and the city was sacked by Frederick I Barbarossa and the Genoese in 1167. Under Frederick II Hohenstaufen, Melfi and Potenza were the only cities of Basilicata to send delegates to parliaments. Frederick II held two such parliaments at Melfi, and the Constitutions of Melfi were promulgated at the parliament of 1231. In 1254, Conrad of Hohenstaufen held a parliament there, at which he poisoned his brother Henry. Melfi supported both Manfred and Conradin against Charles of Anjou and was seriously impoverished by Charles's retaliations. He retained the castle as one of four in Basilicata and taxed Melfi heavily to extend it. Melfi remained the largest town in Basilicata throughout the Angevin period. Joanna made it a duchy and granted it to Niccola Acciaiuoli in 1348, but he lost it to the Hungarians.

Later it passed to the Caracciolo. Melfi was a center for grain and wine production until the fourteenth century; later, its main product was sheep.

Melfi, Synod of

The synod of Melfi was an important church council that met at Melfi, a city in southern Italy (Basilicata). In August 1059, Pope Nicholas II (r. 1058–1061), along with Hildebrand (later Pope Gregory VII, r. 1073–1085), concluded an alliance with the Normans which sanctioned their conquest of southern Italy. Although the synod was called to promote ecclesiastical reform in southern Italy, its significance in history has more to do with the relationship between the papacy and the Normans, as well as the consequences of this relationship for the eastern church. At the synod of Melfi, Robert Guiscard (1057–1085) acknowledged himself to be a vassal of the pope, promised to support

the papacy, and agreed to pay it an annual sum. Robert also agreed to support the papal reforms in his territories. For this, Robert Guiscard was given the title of Duke of Apulia, Calabria, and Sicily. On this occasion, too, Richard of Aversa was granted Capua.

To the papal reformers and to Nicholas II, the agreement with the Normans conferred the freedom to pursue their reforms by strengthening their position against the Roman aristocracy as well as the imperial court, both of which were opposed to Nicholas's decree on papal elections. In legitimizing the Normans' claims to southern Italy, the synod put the western church in direct conflict with the political and ecclesiastical interests of Byzantium there. It put an end to earlier efforts at rapprochement between Rome and the patriarch of Constantinople and seriously complicated future efforts at reconciliation.

The legal basis for Nicholas II's bestowal of the territory on Robert Guiscard seems to have been the Donation of Charlemagne, granting the duchy of Benevento to the Roman church.

Meloria, Battle of

The battle of Meloria, a major naval engagement between Pisa and Genoa on 6 August 1284, established Genoa's hegemony in the Tyrrhenian Sea and marked the end of Pisa's. Pisan power had been

waning as Genoa and Venice established their naval influence, while Lucca, Siena, and Florence prevented the development of a Pisan hinterland. Genoa and Pisa had been at war since 1282, and matters escalated when Pisan galleys under Guido Zaccia unsuccessfully attacked a Genoese convoy accompanied by an armed escort under Benedetto Zaccaria at Tavolara, off Sardinia. Zaccaria subsequently blockaded Porto Pisano, but a fleet of more than seventy Pisan galleys commanded by a *podestà*, the Venetian Albertino Morosini, escaped. Morosini sought to prevent Zaccaria's reinforcement by Oberto D'Oria and his fifty-two galleys still in Genoa's harbor. Fearing entrapment between the fleets, however, he returned to Porto Pisano. D'Oria ordered Zaccaria to withdraw his portion of the newly combined armada, thus taunting the Pisans with an apparently inferior force. Morosini took the bait and led 102 ships against D'Oria's sixty. Once the fleets had engaged, Zaccaria's reappeared and mauled Morosini's right wing, though his left, under Ugolino della Gherardesca, remained intact. Despite inferior forces and heavy losses, the Genoese captured thirty-three Pisan vessels and sank seven, killing some 5,000 combatants and capturing 1,272, according to the victory inscription on the Genoese church of San Matteo.

Memmi, Lippo

Lippo Memmi (fl. 1317-c. 1350) was one of a family of Sienese painters that also included his father, Memmo di Filippuccio, and a brother named Tederigo, who is known only through documentary sources.

Lippo Memmi's earliest known work is a monumental fresco—the *Virgin and Child Enthroned (Maestà)*—in the council hall of the communal palace of San Gimignano, dated to 1317. Although a document (now lost) associated with this work appears to have named only Lippo's father, Memmo, the fresco itself is inscribed with Lippo Memmi's name and is generally accepted as his work. This fresco is a skillful and technically masterful translation into a new setting of Simone Martini's *Maestà* (1315), located in the council hall of the Palazzo Pubblico (civic palace) in Siena. Memmi's *Maestà* attests, even at this stage in his career, to the connections between his work and that of the more famous Simone Martini, who was also Sienese. Memmi was, in fact, the brother-in-law of Martini and sometimes collaborated with him. Memmi's name appears along with Martini's on a splendid altarpiece, *Annunciation with Saints Margaret and Ansanus*, painted in 1333 for the altar of Saint Ansanus in the cathedral of Siena (this work is now in the Uffizi in Florence). Their association is reflected, albeit accidentally, by Vasari, who calls Simone Martini "Simone Memmi" in his *Vita* (mid-sixteenth century) of the great Sienese artist; although this is a misnomer, it reminds us rather poetically of the relationship between Memmi and Martini.

Like the work of many artists in the circle around Simone Martini—called Simone's *chompagni*—Lippo Memmi's is difficult to distinguish from that of the larger group. Various attempts have been made, for example, to identify the nature and extent of Memmi's contribution to the Uffizi *Annunciation*, but no consensus has yet emerged. Memmi's manner does seem to be characterized by smoothly arched hatchings and contours, whereas Simone Martini's is characterized by a complex interweaving of surface planes. However, this criterion alone is insufficient to disentangle Memmi's work from that of the other painters in the circle.

Part of the problem is that there are only a few securely attributed works from which to judge. In addition to the *Virgin and Child* in San Gimignano and the Uffizi *Annunciation*, there exist only three signed works, all devotional paintings. A fourth work, a *Madonna of Mercy* in

the cathedral at Orvieto, is signed *lippus da sena* and is sometimes attributed to Lippo Memmi, but it is not universally accepted as his work. Recent attributions to Memmi, including the *Triumph of Saint Thomas* panel in the church of Santa Caterina in Pisa and the New Testament cycle on the south wall of the Collegiata in San Gimignano, have met with a mixed reception. The latter attribution, if accepted, would add an important piece to the puzzle of Lippo Memmi's oeuvre, supplementing the known devotional paintings with a significant and very accomplished sample of narrative painting.

Meo Abbracciavacca

Meo Abbracciavacca (d. between 1300 and 1313) was from the Ranghiatici family of Pistoia, who were politically Ghibelline. He may have been a money changer by profession, and he probably traveled throughout Tuscany (Pisa, Lucca, Florence) and to France (see the poem *Vacche né tora*). However, he left few documentary traces of his life.

Eight of Meo's nine extant sonnets (found along with his three *canzoni* and letters in the Pisan MS Laurenziano Redi 9) reflect his avid correspondence with contemporary poets in the principal form of literary exchange at the time, the *tenzone*. Four sonnets are addressed to Guittone d'Arezzo, two to Dotto Reali (Lucca), and one each to Finfo del Buono and Monte Andrea. The ninth, a feigned *tenzone* (*Amore amaro, a morte m'ài feruto*), recalls in its *incipit* Guittone's influential language and themes, which dominate Meo's works. In his *canzoni* and the sonnets *Parlare schuro* and *Vita noioza*, Meo pursues a difficult formalism, reinforced in its Pistoiese forms, worthy of Monte and Guittone. Yet Meo often distinguishes his views from Guittone's with regard to misfortune, moral doctrine, and poverty—although at the same time he adheres to Guittone's principle that love ennoble through womankind. Meo's eclecticism is reminiscent of Chiaro Davanzati, who was a poetic chameleon, taking on varying prosodic and thematic values, often those of his poems' addressees.

Meo Dei Tolomei

Meo dei Tolomei (c. 1260-c. 1310), a comic poet from Siena, is known for seventeen sonnets and a *discordo* or *caribetto* found in two principal manuscripts: Chigiano L.VIII.305 and Escorialense e.III.23. Until the discovery of the codex at El Escorial in 1914, scholars attributed many of his sonnets to Cecco Angiolieri because of thematic and stylistic similarities. Meo even shares the *capoverso* of a sonnet with Cecco: *I son sì magro, che quasi traluco*.

Meo is a master of *vituperium*, and he directs his wrath against a "trinity" of characters who seek his financial ruin: his mother; his brother, Mino Zeppa; and a friend, Ciampolino. One of his most dramatic poems, *Su lo letto mi stava l'altra sera*, describes in attempt by his mother to murder him in order to give his part of the inheritance to Mino Zeppa. Another poem, *Quando 'l Zeppa entra 'n santo, usa di dire*, describes the comical reaction of other parishioners to seeing Mino Zeppa, a habitual sinner, in church. *A nulla guisa meposso soffrire*, the *caribetto*, recounts his brother's legendary cowardice.

Meo was well-known in poetic circles, as witnessed by the fact that Dante Alighieri sent him a collection of poems accompanied by the sonnet *Sonetto, se Meuccio t'è mostrato*, and Cino da Pistoia sent him the sonnet *Meuzzo, i'feci una vista d'amante*.

Messina

Messina (in Latin, *Messana*) is a city at the northeastern corner of Sicily that sits directly across the straits of Messina from Reggio di Calabria. In the eighth century B.C., Greek pirates established a city on this site, which they called Zancle; that name—Greek for "sickle"—reflected the shape of the peninsula forming the harbor, which is one of the largest, deepest, and best-protected natural anchorages in the Mediterranean. Exiles from Messenia in the Pelopponesus took the city in the fifth century and renamed it *Messana*. Because of its extraordinary harbor and its excellent location, Messina has had great economic and strategic advantages during most of its history. It stands at the midpoint of the most direct sea route from the eastern to the western Mediterranean and dominates the straits through which most of the commercial and naval shipping of the central Medi terranean passes. In the Middle Ages, Messina became the favorite place for pilgrims and crusaders—most notably Richard Coeur de Lion in 1190—to rest and replenish their supply of food before continuing on to the Holy Land.

Messina remained essentially a Greek city through Roman times and into the Middle Ages. Under the Ostrogoth king Theodoric (r. 493-526), Messina was a Gothic garrison town. Belisarius occupied it in 535, and it remained an important center for Byzantine military and naval operations for the next 300 years. In 827, the Aghlabid emirs of North Africa began their conquest of Sicily. Messina fell to Arab forces in 842 or 843 and became the principal base of operations for the Saracens' attacks on southern Italy in the ninth and tenth centuries. The mainly Greek and Jewish commercial classes of Messina flourished under Arab rule, which gave them ready access to the markets of North Africa and the Levant. In 1038, the Byzantine general George Maniakes attempted, unsuccessfully, to recover Messina with the assistance of Norman mercenaries. The Normans under Count Roger (the future Roger I) took the city in 1060–1061 and used it as a base for conquering the rest of

Sicily. In 1094, Roger confirmed the jurisdiction of the Basilian archimandrite of the monastery of San Salvatore in Messina over the many Greek monasteries and parishes in Sicily and Calabria. The *duomo* of Messina was constructed under Archbishop Robert in the 1090s.

Messina enjoyed more independence from royal authority than any other city in Norman Sicily. The merchant elite of Messina had a fairly strong civic consciousness and carried considerable political weight when they acted in concert. Henry VI Hohenstaufen awarded Messina a free port and preferential customs duties in 1194 for its support during his struggle with Tancred. Constance confirmed those privileges in 1197. However, Messina—unlike its commercial rivals Genoa, Pisa, Amalfi, and Venice—never acquired a communal government. In the 1220s, Frederick II Hohenstaufen revoked many of the privileges of Messina, some of which the enterprising merchants had fabricated; he also stepped up tax collections in the city. Messina revolted in 1232. The savagery with which Frederick suppressed the rebellion so weakened the merchant class that it could no longer effectively counterbalance the landed nobility or resist the incursions of foreign merchants, who accelerated the export of the wealth of Sicily to northern Italy.

After the death of Frederick II in 1250, the warlord Pietro Ruffo attempted to establish a *signoria* based in Messina, but mercantile elements rebelled and established an autonomous commune in 1255. Manfred recaptured the city in 1258. Messina supported Charles of Anjou during the war against Manfred (1265-1268) and became the leading city of Sicily during the Angevin era. Indeed, after the Vespers uprising of 30 March 1282 in Palermo, Messina initially aided the Angevin king Charles II and did not expel its own French garrison until 28 April. However, Messina then held out heroically against Charles's attempt to recapture the city.

Peter III of Aragon became king of Sicily by right of his mother, Constance, the daughter of Manfred. He conferred privileges on Messina that extended its jurisdiction and promoted its industries, especially the production of silk. Messina prospered into the 1300s, but not as much as Palermo, which derived more benefit from the Aragonese connection. Messina declined during the protracted wars between the Aragonese and Angevin kings, which wrecked its

traditional commercial links with Naples and Calabria. The crown of Aragon treated Sicily as little more than a cash cow, a policy that encouraged the development of a wheat monoculture. The export of wheat—rather than the mixed economy of Norman and Hohenstaufen times—suited the fiscal interests of the royal government and the demands of the foreign merchants who dominated Sicilian commerce.

Messina experienced something of an economic revival under the administration of the Castilian king Ferdinand I the Just (1412–1458), who ruled Sicily through viceroys but brought an end to a period of civil strife that had seriously damaged the Sicilian commercial economy. Messina became a minor cultural center in the mid-fifteenth century. By the 1480s, it had developed a modest publishing industry. After the death of Ferdinand the Just, Spanish viceroys cut off all economic links with Messina's natural trading partners in the kingdom of Naples. The moral and ecclesiastical censorship that accompanied the Spanish Inquisition into Sicily in 1487 killed off the cultural revival. Expulsion of the Jews in 1492 contributed further to the decline of Messina. In general, Spanish rule produced an economic stasis, and the commercial life of Messina languished, despite its excellent harbor and strategic location.

Earthquakes in 1783 and 1908 leveled much of Messina, including most of the medieval city. The *duomo* and the churches of Santa Maria del Graeffo "La Cattolica," L'Annunziata dei Catalani, and San Francesco are among the few medieval buildings that have been reconstructed.

Michael of Piazza

To Michael of Piazza (Michele da Piazza, fl. 1349–1361) is ascribed an anonymously transmitted chronicle of insular Sicily from the death of Frederick III in 1337 to late September 1361. Seventeenth-century notices—of uncertain validity and drawing on manuscripts now lost—provide us with the author's name; the information that he was a Franciscan friar; and a probably nonauctorial title, *Historia Sicula* (*Sicilian History*). The chronicle is a largely month-by-month account of events, with some gaps in the coverage of earlier years. Initially, Michael follows a schema analogous to those of other Sicilian chronicles, but he is independent from 1349 onward. The work as we have it is arranged in two books, of which the first lacks a preface and the second breaks off abruptly; thus, it may have been unfinished, mutilated in transmission, or both. It appears to have been written piecemeal starting at least as early as October 1353. It is famous for its account of the arrival of the black death in Messina in 1347 and of the spread of the epidemic there and elsewhere (1.27-29); it is also our primary narrative of the ongoing power struggle of the island's Catalan kings and their adherents (the *Catalani*, strongly favored by Michael) against their opponents (the *Latini*) supported by the Angevin kings on the mainland. The chronicle contains many summarized speeches and letters, whose wording seems essentially Michael's own; it preserves the text of important documents we otherwise would not possess, reports on economic and social as well as political matters, and is attentive to the sufferings of ordinary people.

Though his name would indicate an origin in what is now Piazza Armerina, Michael wrote as a citizen of Catania. He was evidently a religious person, and he has been tentatively identified as the warden of a Franciscan convent in Catani a. His Latin *style*, characterized by a sprawling linear syntax and by a predilection for proverbs, is often ungrammatical and sometimes obscure. Yet it can be quite forceful, especially in the numerous moral and political outbursts rhetorically addressed either to Sicilians as a whole or to inhabitants of a particular locality. These have the appearance of small homilies and suggest Michael's probable experience as a preacher. Other striking passages

recount the mutilation and partial consumption of count Francesco Ventimiglia's corpse by people of Geraci (1.9), compare Catania's lord Blasco Alagona and his son Artale to an eagle training its offspring (1.78), describe a plague of locusts and its associated human mortality and famine (1.116), and present a dialogue between Saint Agatha and a personified Catania in which Artale is praised as the city's sole angel of Christ, always ready to defend it with his blood (2.16). Much of the backdrop or basis of the chronicle is formed by notices of military actions and of occasional mob violence as cities, towns, and territories changed hands or allegiance, or as attempts were made to have them do so. Michael, who was heir to the national spirit of the *Vespers*, recorded his country's dismemberment during years of pestilence and civil strife.

Michael Scot

Though famous as an astrologer and magician, Michael Scot (or Scott, c. 1175 or 1195-1235 or 1236) is chiefly important as a scientific translator. He was born in Scotland but went to Spain, where he learned enough Arabic to make Latin translations of numerous scientific and philosophical works, sometimes with a collaborator. The earliest of these works was al-Bitruji's defense of the Aristotelian astronomical model (Toledo, 1217), to which Aristotle's *De caelo* was a natural sequel, together with Averroes's major commentary on it. Equally important were Scot's translations of Aristotle's *History of Animals* and several related biological works. In addition to these major translations, which undoubtedly are the work of Scot, many others have been attributed to him (Minio-Paluello 1974). Like other Latin translations of Aristotle from Arabic, Scot's were replaced within a century by better versions from the original Greek, but his were the ones from which thirteenth-century scholastics worked.

By 1220, Scot had moved to Italy, where he remained until his death. His success as a translator gained him the patronage of the papacy, through which he secured several ecclesiastical benefices in England and Scotland (1224-1227); the income from these sinecures, which he never visited, apparently supported him for the rest of his life. From the papal letters of recommendation we learn that Scot was a priest and held a university degree (*magister*). Although some scholars have supposed that he studied and taught at Paris, his association with Bologna is better documented, for he was living there in 1220-1221 and predicted the future of the Lombard League for officials of Bologna in 1231.

Scot's most famous patron was Emperor Frederick II. A later generation (e.g., Salimbene, c. 1221-1290) would remember Scot as

"astrologer to the emperor," although it is not clear whether Frederick retained Scot at court or only consulted him occasionally. Certainly Frederick and Scot conversed from time to time, as Scot repeatedly recalled with pride. In 1232, Scot translated Avicenna's treatise on animals for Frederick, who used it in his own work on falconry.

Scot also dedicated his most ambitious work to Frederick. This was an untitled trilogy on astrology to which he devoted his last years. The first book, *Liber introductorius*, is a rambling introduction to astrology that is addressed to amateurs with little background in science. Scot fleshes out the dry bones of professional astrology with examples, digressions, and encyclopedic information that make this work more lively and engaging, though less useful, than its predecessors. The second book, *Liber particularis*, adds more advanced explanations, including some given in response to questions asked by Frederick. The third book, *Liber physionomiae*, deals with living creatures, notably mankind, and shows especially how human character can be deduced from physical signs. An abridged version of the last book was immensely popular (it was printed about forty times), but the rest remains unpublished except for excerpts. Unlike other scholastics, Scot wrote for nonspecialists; he was remarkable not so much for his learning as for his willingness to display and exaggerate it. His contemporaries were duly impressed and regarded him as a magician, but in the next generation, Roger Bacon and Albertus Magnus insisted that he was a charlatan, and Dante put Scot in hell as a diviner (*Inferno*. 20.115-117).

Milan

Physical Characteristics and Origins

The city of Milan is situated in the heart of the Po valley, and over the centuries it has played a major role—whether political, military, or economic—in the history of northern and central Italy. To its north are the Alpine passes; to its west, south, and east are the great navigable rivers: the Ticino, the Po (and its tributary, the Lambro), and the Adda. Beginning in Roman times, the city was near the crossroads (at Piacenza and Cremona) of two intersecting trade routes. One route ran from southern France and Genoa in the southwest to Friuli in the northeast (and from there to either the Balkans or the Danube regions); the other connected the Adriatic coast (especially Ravenna) in the southeast with central France in the northwest. Historically, the city has also benefited from the varied topography of its surrounding territory. The four geographic zones that make up Lombardy—mountains, hills, high dry plain, and marshy lowlands (called *la bassa*)—have each provided essential raw materials and agricultural products, thereby contributing to the remarkable economic vitality of the region. Then, as now, the Lombard plain was the most fertile region on the peninsula. For much of the High and Late Middle Ages, however, "Lombardy" extended far beyond its present boundaries to include parts of Venetia to the east and Emilia Romagna to the south.

Milan was probably founded by a Celtic tribe, the Insubres, who moved from cisalpine Gaul in the early fourth century before Christ and founded a settlement on or near the site of an Etruscan town. The

Celtic name they gave to this site (*met lan*) is thought to mean "middle land." After having captured the northern plain from the Etruscans, the Insubres found themselves confronting the Romans. In 222 B.C., the Insubres suffered a serious defeat at the hands of the Romans who occupied the *mediolanum* (Latin for "middle land"). However, the Insubres, together with the Boii, continued to threaten Roman hegemony in the Po valley. To guard their newly conquered territory from these Gauls, Rome established colonies at Cremona and Piacenza in 218 B.C. When Hannibal crossed the Alps that year, he found ready allies in the Gauls, but after his defeat the Gauls were once again at the mercy of Rome; by 194 B.C., their defeat was complete and Milan came under Roman control. In 89 B.C., the city was elevated to the status of a Latin colony; in 49 B.C., the Roman government rewarded it with the status of a *municipium* and its inhabitants received Roman citizenship. In the second century after Christ, Emperor Hadrian (r. 117–138) honored the city with the title of imperial colony.

The cities of republican Rome were built as a grid of perpendicular streets. In Milan the main *cardo* ran northeast to southwest (toward present-day Via Manzoni) and the main *decumanus* ran southeast to northwest (toward present-day Corso di Porta Romana). The city's first walls were built in the second half of the first century before Christ and were later enlarged, probably during the reign of Emperor Maximian (286–305), to a total perimeter of approximately 28 miles (45 kilometers). By the late empire, the principal buildings were the imperial *palatium* (near the present Carrobbio), the forum (now piazza San Sepolcro), the circus (alongside present Via Circo and Via Cappuccio), the theater (with a seating capacity of 7,000; it now lies beneath Palazzo della Borsa), the amphitheater (where Via Arena is today), the great baths dedicated to Hercules (where the church of San Vito in Pasquirolo stands today), the basilica Palatina (now the church of San Lorenzo), two octagonal baptisteries (San Giovanni alle Fonti, formerly attached to Santa Tecla; and Santo Stefano, beneath the *duomo*), and six Christian churches. These six churches were the two cathedrals and four basilicas: *basilica Salvatoris* (San Dionigi; demolished in the late eighteenth century), *basilica Virginum* (San Simpliciano), *basilica Apostolorum* (San Nazaro), and *basilica Martyrum* (Sant'Ambrogio).

History and Municipal Institutions

The history of medieval Milan is not as well known as that of the other three great northern and central city-states—Genoa, Venice, and Florence. Partly, this is either because the Milanese did not produce the range of documents found in the other three cities or because the documents were destroyed over time. But it is also true that the artistic, commercial, and political achievements of these other three cities have attracted far more historians than have the great industries and despotic rulers of Milan. In the High and Late Middle Ages, however, Milan was the great power of the northern plain or Po valley—the center of an enormous regional state which at its height, at the dawn of the fifteenth century (when it seemed on the verge of becoming the capital of a unified Italian state), stretched from Ventirni glia and Genoa in the west to Verona, Vicenza, and Padua in the east to the Alpine passes in the north and to Bologna, Pisa, Siena, and Perugia in the south.

Late antiquity (200-568). Milan rose to economic and political prominence in the third and fourth centuries and became the second largest city in the west after Rome. As the northern Italian center of a road system that connected Rome with Spain and Gaul to the west and Aquileia with the Danube and Balkans to the east, Milan became an important commercial and military post. In 286, Diocletian selected Milan as the capital of the west for his coemperor Maximian—a distinction the city enjoyed until 402. After the early fourth century, the city also became the residence of the governor (*consularis*) of the province of Aemilia Liguria, of the praetorian prefect, and of the vicar of Italy. It was there that Constantine and Licinius met in 313 to promulgate the Edict of Milan, granting religious toleration to all religions, including Christianity.

The leading Milanese figure in this period was Saint Ambrose (c. 340–397). Ambrose was born into a Christian family and pursued a public career, becoming *consularis Aemiliae et Liguria* c. 370. In 374, while still a catechumen, he was acclaimed bishop by a populace at odds over whether the newly vacant see should be occupied by an Arian or a Catholic. Despite his initial reluctance to accept his election, he soon emerged as the most authoritative church leader in the west. For future

Milanese bishops he became the model pastor, one who personally instructed his flock (Ambrose's erudition, eloquence, and piety were instrumental in the conversion of Augustine of Hippo) and who defended the church against heresy and secular encroachment. So great was his influence that the liturgy of the Milanese church is known as the Ambrosian rite. In his dealings with the Roman emperors, Ambrose followed the motto: "The emperor is within the church: he is not above it." In 386, when the Arian regent Justina, mother of Emperor Valentinian II, tried by military threat to force Ambrose to give one of Milan's churches to Arian believers (recent scholarship indicates that the church in question may have been San Lorenzo), Ambrose steadfastly refused, and he rallied the spirits of his besieged Catholic congregation by composing popular hymns, thereby initiating a practice of singing which was adopted throughout the western church. In 390, Ambrose excommunicated Emperor Theodosius I for ordering the massacre of Thessalonica's inhabitants. Ambrose also bequeathed to Milan at least two of its great paleo-Christian churches, the *basilica Apostolorum* (San Nazaro), and the *basilica Martyrum* (Sant'Ambrogio).

Church of San Lorenzo Maggiore and Roman columns, Milan. Photograph courtesy of Christopher Kleinhenz.

The fifth and sixth centuries brought a series of disasters to Milan, and the city lost its preeminence in northern Italy to neighboring Pavia. In the face of the Visigothic invasion of Italy, Emperor Honorius abandoned his imperial residence in Milan and escaped to Ravenna, which in 402 became the new imperial capital of the west. In 452, Attila the Hun besieged Milan. Between 489 and 493, Ostrogoths swept into northern Italy and established their kingdom there, choosing Pavia as their capital. Ostrogothic rule was benign but short-lived. In 535, a

reinvigorated Byzantine imperial government under Emperor Justinian sought to recapture the former western provinces of the empire from the recently established Germanic kingdoms. In 538, the Byzantine forces captured Milan, only to lose it a year later to the Ostrogothic warrior Uraias after a prolonged siege. Uraias punished the Milanese severely for harboring the imperial forces. According to the Greek historian Procopius, the Ostrogoths razed the city, massacred the men, and sent the enslaved women north to the Ostrogoths' Burgundian allies. For northern Italy, the net result of the Gothic war and the reestablishment of Byzantine rule in 553 was devastation far greater than all the preceding barbarian invasions had produced. Oppressive Byzantine taxation (553–568) aggravated the situation, as did the Lombard invasions.

Early Middle Ages (568-1097): Lombards (568-774). The Lombards invaded the Po valley in 568 and easily captured Milan. The archbishop, most of the clergy, and many of the oldest and most distinguished families abandoned the city and took up residence in Genoa, which was part of the Milanese archdiocese and still under imperial control. Their absence lasted for nearly seventy-five years—until the mid-seventh century, when the Lombard king drove the Byzantines out of Italy. Milan also suffered when the Lombards made Pavia the capital of their kingdom; like other Lombard cities, Milan was governed by a duke.

Carolingians (774–887). In 772, Charlemagne crossed the Alps at the request of Pope Hadrian I to halt the Lombards' incursion into papal lands. The Franks besieged Pavia for almost two years before capturing the city and its king in 774; thereafter, Charlemagne adopted the title King of the Franks and the Lombards. Although Pavia remained the capital of the new kingdom of Italy (*regnum Italiae*), Milan began to emerge from the obscurity of the previous century, thanks to its archiepiscopal status. Administratively, Frankish counts replaced Lombard dukes, but in practice the archbishops wielded greater authority. This was in part because the religious reforms, privileges, and donations of Charlemagne and his successors strengthened the position of the archbishops, and in part because the archbishops resisted Charlemagne's centralization and succeeded in preserving a unique autonomy. When Charlemagne tried to create religious uniformity within his realm by ordering that the Roman rite replace all local

liturgical rites, Archbishop Thomas (r. 755-783) appealed to Rome. Pope Hadrian I sided with the Milanese and preserved the Ambrosian rite. This renewed identification with Saint Ambrose energized the Milanese church. In 784, Archbishop Peter founded the Benedictine monastery of Saint Ambrose next to the saint's great basilica. The basilica itself was rebuilt and became the burial place of rulers, among them Charlemagne's son Pepin and Emperor Louis II. The two greatest bishops of the Carolingian age—who were both responsible for the amplification and beautification of Sant'Ambrogio—were Angilbert II (in 824-859) and Ansper (868-881).

Italian kings (888-962). Following the deposition of Emperor Charles the Fat in 887, political chaos reigned in Italy. Milan's archbishops sought to restore peace by cooperating with the Italian kings, modeling themselves on the example set by Saint Ambrose in his relations with the empire.

Archiepiscopal rule (c. 980-1045). When the empire was revived in the mid-tenth century, the archbishops of Milan were its direct beneficiaries. The archbishops became close allies of Emperor Otto I, and he in turn granted the Ambrosian church new lands. His son, Otto II, was crowned king of Italy by Archbishop Landulf II (Landolph of Carcano, r. 979-998) in the basilica of Sant'Ambrogio. Otto II rewarded

the archbishop by naming him and his successors counts of Milan. Landulf extended his temporal power further by reaching out to the city's nobility and creating a new class of loyal vassals (*capitanei*), to whom he distributed church property. In 1004, Archbishop Arnulf II (r. 998-1018) crowned the future emperor Henry II (r. 1014-1024) king of Italy; Arnulf then supported the emperor against the forces of Arduino d'Ivrea (r. 1002-1014), who was attempting to establish a kingdom of Italy independent of the empire.

Archiepiscopal power and prestige reached their apogee during the archbishopric of Aribert of Intimiano (Ariberto da Antimiano, Herbert of Antimiano; r. 1018–1045), who combined a strong concern for the spiritual welfare of his flock with the political and military prowess of a great feudal lord. As a religious leader, he revived monasticism and the communal life of his clergy, provided for the reconstruction of churches, commissioned important works of religious art, assisted the poor, and attempted to eradicate Catharism. As a political leader, he tried to re-create a kingdom in northern Italy with Milan as its capital. On the death of Emperor Henry II, Aribert gave his full support to Conrad II, the Salian, against the wishes of most of Italy's imperial vassals. Aribert's coronation of Conrad as king of Italy took place in Milan (1026)—not in Pavia, as had been the tradition. This change not only increased the archbishop's personal authority it also signaled the end of Pavia as the political capital of northern Italy. At Conrad's imperial coronation in Rome (1027), the ascendancy of Milan was ensured when Pope John XIX elevated its archiepiscopal see above all the others, including that of Ravenna.

In 1035, on Aribert's triumphant return from a victorious military campaign in Burgundy, the minor vassals (*valvassores*) in and around Lombardy rebelled against him and his greater vassals (*capitanei*). The cause of the rebellion was the precariousness of their fiefs, which could be given and taken away at will. In fighting for the right to inherit their fiefs, the *valvassores* sought to share in the privileges of the *capitanei* and increase their opportunities for social advancement. To mediate this bloody dispute, Conrad traveled to Milan. When Aribert refused to present himself before the emperor, Conrad ordered his arrest. After a brief imprisonment, Aribert rallied all the inhabitants to his cause. Conrad attacked and laid siege to the city; when the Milanese did not

capitulate, he tried to win over the *valvassores* by issuing the *Constitutio de feudis* (1037), which granted them the long-sought right of inheritance. Despite Conrad's military and political maneuvers, the Milanese held firm. Legend has it that during Conrad's second siege of the city (1039), Aribert rallied the Milanese around the *carroccio*—a richly adorned wagon drawn by oxen, carrying an image of Christ and the insignia of each of the city's gates. The *carroccio* was driven onto the battlefield as a symbol of civic pride, and it continued to be used during the subsequent communal age. At the death of Conrad (1039), the imperial siege was lifted, and, in 1040, Aribert made peace with the new emperor, Henry III. No sooner had peace been achieved, however, than a new civil war broke out. Led by Lanzzone de Corte, a nobleman and archiepiscopal notary, the citizens (*cives*)—judges, notaries, merchants, and artisans—drove the archbishop and the nobility from the city. In 1044, when the warring factions successfully negotiated a peace agreement, their accord foreshadowed the future commune. By the time Aribert died in 1045, archiepiscopal power was in decline, never again to be revived.

Patarine uprising (1045-1075). For thirty years after the death of Aribert, the feudal and conservative Milanese church was disrupted as the city was convulsed by a series of popular revolts. The Patarine rebellion in the second half of the eleventh century began as part of the wider European movement to reform the church by eradicating clerical simony and concubinage. Although the origin of the name Patarine is not entirely clear, it is thought that because these reformers criticized the clergy's wealth, their detractors called them the *patarinus idest pannosus*, (ragged ones). However, although the movement had the support of members of the lower classes, it was led by noblemen and clergymen.

Backed by two cathedral canons—Anselm of Baggio (the future Pope Alexander II) and Landulf Cotta—the movement was led first by a deacon named Arialdo and then, after Landulf died, by Arialdo's brother Erlembald. Clerics accused of immorality were physically attacked and driven from their homes. In 1057, the pope sent two legates to Milan to investigate: Anselm of Baggio (by then bishop of Lucca) and the monk Hildebrand (the future Pope Gregory VII). Another papal legate, Peter Damian, was sent in 1059. Although Peter succeeded in restoring

relations between Rome and Archbishop Guido of Velate (r. 1045-1071), the peace was ephemeral. The archbishop, the higher clergy, and the feudal nobility all opposed the reforms, not only because members of the higher clergy came from noble families and had purchased their offices, but also because they feared that the Milanese church would become completely subservient to Rome. Erlembald, who staunchly supported Rome's primacy, traveled to Rome to seek the advice of his brother's former ally, Anselm of Baggio—by then Pope Alexander II (r. 1061-1073)—who offered his support by giving Erlembald the banner of Saint Peter and making him a gonfalonier (standard-bearer) of the church.

Violence again broke out after a Roman council in 1063 prohibited married priests from celebrating mass and instructed the laity to desert them. In Milan, the pope's order was viewed by many as an attack on the Ambrosian church, which had a long tradition of married clergy. Pope Alexander responded by excommunicating Archbishop Guido (1066), who in turn accused Ariald and Erlembald of sowing discord and attempting to enslave the church of Saint Ambrose. Ariald's and Erlembald's allegiance to Rome troubled even some of their supporters, and the two reformers found themselves increasingly isolated. Later that same year, Ariald was captured, tortured, and killed. Left alone to lead the movement, Erlembald once again requested an audience with the pope. On his return to Milan, he carried with him the pope's permission to convene an assembly of citizens and to elect a new archbishop. Once again pitched battles broke out, but by then the struggle to elect a new archbishop for Milan had become part of the larger investiture conflict between church and empire. Archbishop Guido resigned his office, though not before persuading the German king Henry IV (crowned emperor in 1084) to invest Guido's secretary, Godfrey of Castiglione.

To the Milanese, the new candidate was unacceptable, both because he was a simonist and because he was an outsider. After Guido's death in 1071, the Milanese cleric Attone (r. 1072-1085) was elected with the backing of the papacy. Henry IV naturally opposed the election and succeeded in having his candidate, Godfrey (1072-1075), consecrated not at Milan but at Novara. Soon after his own election as pope, Gregory VII (r. 1073-1085) excommunicated Godfrey. The following

year, Pope Gregory ordered the deposition of simonist clerics and the excommunication of both laymen who invested clerics and clerics who accepted such investiture.

In 1075, Godfrey and Erlembald both died (the latter was killed in battle); and although the violence subsided, the two opposing factions survived, each strengthened by royal or papal support. Almost overnight, what had been largely a local dispute turned into an international crisis: when the chaplain of the imperial court, Tedaldo (1075 to 1085), was invested by Henry IV and consecrated on 4 February 1076 against Gregory's express opposition, there followed the famous papal excommunication of Henry, and, a year later, the dramatic reconciliation at Canossa (1077). The end of the Patarine movement came in 1086 with the election of Anselm III of Rho. Invested by Henry IV and confirmed by Urban II, the new bishop embraced the reforms so long advocated by the Patarines. A small number of radical Patarines, however, survived and eventually merged with other heretical groups.

High Middle Ages (1097-1277): Commune (1097— c. 1240). In the wake of the Patarine struggle, the various factions tried to develop a more inclusive government. The archbishop continued to be the nominal leader, but power gradually passed into the hands of laymen. The commune (*commune civitatis*), first mentioned in a document of 1097, consisted of a popular assembly and an executive council composed of consuls elected from the city's three factions—*capitanei*, *valvassores*, and *cives*.

By the early twelfth century, political consolidation was accompanied by military and economic expansion. To gain access to central Italy and the Adriatic, Milan attacked Lodi and Cremona; to reach the Ligurian coast, it defeated Pavia; and to secure the Alpine passes, it destroyed Como. Milan's expansion brought it into direct conflict with Frederick I Barbarossa (r. 1155-1190), who wished to reassert direct imperial rule over Italy. Twice, in 1158 and 1162, Frederick successfully besieged Milan. The second defeat was particularly severe: Frederick ordered the demolition of Milan's walls, gates, and towers, and the palaces of his principal enemies; moreover, he expelled the entire population, forcing them to live for four years in the suburban areas. Milan's isolation, however, was only temporary. Growing aversion to imperial rule among the communes of northern

Italy soon led to the formation of the Lombard League, whose forces defeated an imperial army at Legnano (1176). By the Peace of Constance (1183) the Lombard communes secured their de facto autonomy from the empire, while still recognizing their de jure sovereignty.

Communal liberty did not, however, put an end to Milan's social tension. In 1198, the city's shopkeepers and artisans formed an association known as the *credenza di Sant'Ambrogio* to protect their political and economic interests. Opposing them was the *motta*, composed of lesser nobles, wealthy commoners, and merchants; the great nobles for their part remained closely tied to the archbishop. To maintain peace and achieve political reform the Milanese increasingly resorted to the one-man rule of a foreign magistrate, the *podestà*. The policies introduced by the *podestà* included protecting the citizenry from arbitrary confiscations by the government (1205); laying the groundwork for the general assessment of properties (*catasto*); making commoners as eligible for public office as nobles were (1214); codifying customary law (1216); and constructing a new communal palace, or *Broletto nuovo* (1228). The renewed confidence of the Milanese became evident in 1220 when they not only refused hospitality to Frederick II (r. 1215-1250) as he traveled from Germany to Rome for his imperial coronation, but also opposed his coronation as king of Italy. In 1226, a second Lombard League (strengthened by papal support) was formed against Frederick II. This time the empire prevailed, at the battle of Cortenuova (1237). Within the city, the commoners, fearing reprisals from the nobility who had sided with the emperor, elected a new official—known as the *capitano del popolo*—to rule alongside the *podestà*. The first such *capitano* was Pagano della Torre (1240), who was already prominent as leader of the *Credenza di Sant'Ambrogio* and a member of the anti-imperial and pro-papal faction known as the Guelfs.

Della Torre signory (1240-1277). For the next four decades, Milan was ruled on and off by Pagano's relatives. What distinguished the Della Torre *signoria* from later ones was its plebian character. In opposition to the Della Torre, nobles and Ghibellines rallied around Archbishop Ottone Visconti (r. 1262-1295), whom the Guelf Della Torre had barred from the city. In the end, however, Visconti's forces prevailed at the

battle of Desio (1277) and the Delia Torre *signoria* came to an end.

Religious movements in the communal age. The demographic and commercial expansion of the communal age contributed to a great variety of religious experiences. As parishes were created (the first recorded parish was San Sepolcro in 1100), the cathedral became less central to the life of the citizenry. Moreover, new and sometimes heterodox religious movements flourished. Pope Innocent III, writing to the archdeacon of Milan in 1198, expressed concern at the city's large number of heretics: Cathars, Waldensians, and Poor Lombards. In 1252, Cathars killed the Dominican inquisitor Peter of Verona (Saint Peter Martyr) as he traveled to Milan. A local movement called the Humiliati ("humbled ones")—whose members earned their livelihood as textile workers and pursued the apostolic ideal of voluntary poverty, fasting, prayer, and public preaching—was initially suspected of heresy. In 1201, however, Innocent III approved a rule by which the Humiliati formed three orders: a first order of canons and sisters, a second order of celibate laypeople, and a third order of married men and women. According to their most famous member, the poet and chronicler Bonvesin da la Riva (c. 1250–c.1315), by 1216 the Humiliati owned 150 houses in and around Milan; the most famous of these was the convent of Brera, founded in 1201.

The mendicant friars established themselves in Milan soon after gaining papal recognition and approval. Saint Dominic visited Milan in 1219, and a year later his friars were given the paleo-Christian church of Sant'Eustorgio. The Franciscans arrived a few years later, living at first outside the city's walls. In 1233 they began construction on the church of San Francesco, now no longer standing.

Late Middle Ages (1277–1395): Visconti signory (1277–1447). For the remainder of the medieval period, Milan was governed by the Ghibelline *signoria* of the noble Visconti family. Ruling first as *signore perpetuo* and later as *signore assoluto*, Archbishop Ottone Visconti demoted the citizen council to a merely advisory body. He disbanded the two major political associations (the *motta* and the *credenza di Sant' Ambrogio*), and, in 1279, he created the *tribunale di provvisione* (composed of a *vicario* and twelve magistrates) to oversee all aspects of the city's economy. In religious affairs, he barred commoners from joining the metropolitan chapter, having stipulated that only the 200

hundred noble families he had selected would be eligible. Since, historically, Milan's archbishops had risen from the ranks of the metropolitan clergy, Ottone's action was designed to prevent commoners from heading the Milanese church. In 1287, Ottone obtained the office of *capitano del popolo* for his grandnephew, Matteo Visconti, who the following year became *podestà* as well. Between 1302 and 1311, the Delia Torre family made a brief comeback, but in 1311 Matteo Visconti was in power again, first as imperial vicar and then as *dominus et rector generalis mediolani* until his death in 1322. When Matteo made war on the Guelf rulers of neighboring cities, he incurred a papal excommunication, and Milan was placed under an interdict that was not lifted until the mid-fourteenth century.

Matteo's son, Galeazzo (r. 1322-1327), succeeded him as imperial vicar and continued his war against the papacy and its Guelf allies, particularly Florence and Naples. During the rule of Galeazzo's son Azzone (1329-1339), and of Galeazzo's brothers Luchino (1339-1349) and Archbishop Giovanni (1349-1354), the Visconti regional state began to take shape. In rapid succession the Visconti became lords of many neighboring cities: Bergamo and Novara (1332), Cremona (1334), Como and Lodi (1335), Piacenza (1336), Brescia (1337), Asti (1341), Parma (1346), Bologna (1351), and Genoa (1353). Under Azzone, Milan's municipal and guild statutes were revised and the Visconti court began to attract some of the greatest artists of the age. Azzone invited Giotto to decorate his palace (now destroyed), and the splendid Gothic church of San Gottardo in Corte was built during Azzone's reign. When Petrarch visited Milan in 1353, he lived as a guest of Archbishop Giovanni Visconti (the last of Milan's warrior-archbishops). Archbishop Giovanni reversed his father's imperial policy and formed an alliance with the papacy and the Guelf states of Florence and Naples. Nevertheless, when Giovanni changed course and attacked Florence, Innocent VI organized a military expedition against the city, fearing that the papal states would be Milan's next target.

At Giovanni's sudden death in 1354, his joint heirs were his three nephews—Matteo II (1354-1355), Galeazzo II (1354-1378), and Bernabo (1354-1385). After the premature death of Matteo II, Galeazzo II controlled the western half of the Visconti state, while Bernabo held the eastern half. This division so weakened Milan that Bologna (in 1355)

and Genoa (in 1356) successfully rebelled.

At Galeazzo's death in 1378, his son Gian Galeazzo (1378-1402) became Milan's ruler. Gian Galeazzo received the title Count of Vertus from his first wife, Isabel of Valois, daughter of John II of France. His second wife, Catherine, was the daughter of his uncle and ruler, Bernabò. This double relation did not, however, prevent Gian Galeazzo from throwing Bernabò into prison (1385), where he died within a few months. Under Gian Galeazzo's rule, the reunified Milanese state reached the height of its prosperity, power, splendor, and territorial expansion. Firmly in control of Lombardy, Gian Galeazzo went on to conquer Verona, Vicenza, Pisa, Siena, and Perugia. His anti-Florentine and pro-French foreign policy led him, in 1389, to marry his daughter, Valentina, to Louis, duke of Orleans, son of King Charles V. (It was on the basis of this marriage that the French claimed Milan when they invaded Italy in 1499.) When the French, however, refused to support his plan to conquer Tuscany, Gian Galeazzo turned to the empire, from which he received (for the sum of 100,000 florins) the imperial title of duke, which elevated him above all other Italian rulers. Thus, at the close of the fourteenth century it seemed almost inevitable that an expansionist Visconti duchy would soon become the heart of a unified Italian state. Then, just as Milan seemed on the verge of conquering Florence, Gian Galeazzo died (1402). After his death, the Visconti state gradually declined. The second of his two sons, Filippo Maria (1412-1447), was the last Visconti ruler. Gian Galeazzo is remembered not only for his political and military exploits, but also for his patronage of learning and the arts. In Pavia, he enlarged the university, which had been founded by his father, Galeazzo II, and he built the magnificent Carthusian monastery (*Certosa*, or charterhouse) as a family mausoleum. His enormous library (rivalled only by that of his brother-in-law Charles V of France) was for a long time regarded by historians as evidence of his direct involvement in commissioning luxurious manuscripts. More recently, however, scholars have found that Gian Galeazzo amassed most of his holdings by plundering the libraries of his vanquished foes. When, for example, he conquered Padua in 1388, he carried off Francesco da Carrara's entire library, which was famous for possessing manuscripts once owned by Petrarch.

Economic Life

Despite its location near the great southwest-northeast and southeast-northwest trade routes that converged in the Po valley, Milan never became a commercial capital like the maritime cities of Genoa and Venice. Instead, it relied on Genoese and Venetian merchants for the import of eastern luxury goods and the export to the Levant of its manufactured products, Milanese merchants restricted themselves to buying and selling grain and other local agricultural products, including salt from the Venetian lagoon, raw materials needed in industry (especially linen, wool, and iron), and locally manufactured goods. Nor, despite the early successes of Lombard money changers and bankers throughout northern Europe, did Milan ever become a major financial center, as Florence did. From Roman times down through the Middle Ages, Milan's real economic strength lay in its industries, notably in the production and export of textiles, arms, and metallurgy. Unfortunately, because of the relative paucity of surviving archival sources, far less is known about the way industrial production was organized and carried out in Milan than is known about other leading industrial centers, such as Florence.

Late antiquity and early Middle Ages (300-1100). During the fourth century, when it was the western capital of the empire (282-402), Milan was one of the principal producers of Roman metallurgy and woollen cloth. Little is known about Milan's economy following the disintegration of the empire, but there is evidence that during the Lombard period (568-774), Milanese merchants were traveling to France with their wares. The presence of an important mercantile sector is also attested to by the inclusion in the Lombard law codes of a separate order of merchants ranking just below the nobility, as well as by the fact that by the ninth century the Po valley was the site of regular seasonal fairs. As regards Milan, however, from the late sixth century through the tenth century, its economy was overshadowed by that of neighboring Pavia, where the presence of the royal court attracted a large volume of trade and gave the city's merchants exclusive rights to the importation of eastern spices, precious stones, raw silk, and costly fabrics. These positions were reversed beginning in the early eleventh century, when Milan began its rise to economic and political

prominence, largely at the expense of Pavia, which after 1026 ceased to be the capital of the kingdom of Italy. The earliest documented merchant corporation of the peninsula (the *ordo negotiatorum* of 1067) was Milanese.

High Middle Ages (1100-1300). Although there are no written sources to provide reliable evidence of population levels in the early Middle Ages, the extension of city walls throughout the peninsula in the course of the twelfth century attests to an increase in urban population. Milan shared in this trend: new wooden palisades atop earthen ramparts and surrounded by a moat were built between 1152 and 1158 around the expanding suburbs to protect the city from the attacks of Frederick I, only to be partially torn down by him in 1162. By end of the twelfth century, the city and its ramparts were rebuilt; and gradually—by the mid-fourteenth century—stone walls replaced the ramparts up to what is known as the *cerchia dei navigli*, the circle of canals that bounded the medieval city. Traffic in and out of the city passed through six large fortified gates (*porte*)—Comasina, Nuova, Renza (or Orientale), Romana, Ticinese, and Vercellina—and a number of smaller gates known as *pusterle*. For administrative purposes, the city was subdivided like wedges of a pie into six sections, each taking its name from one of the six main gates. At nearly 600 acres (approximately 240 hectares), Milan was the largest walled city on the peninsula; and this figure excludes the large suburban areas outside the city's walls.

By far, the most ambitious construction during the twelfth and thirteenth centuries was not the city's defensive walls and moat, but rather the great canals that connected Milan to the nearby rivers and provided water essential for irrigation and transportation. In 1179, construction began on the Ticinello, a canal intended primarily for irrigation, which connected the Ticino River with the town of Abbiategrasso to the southwest of Milan. In the thirteenth century, the canal was extended to Milan itself and renamed the Naviglio Grande ("great canal"); by 1269-1271 it was large enough for navigation and was regularly used to transport foodstuffs and the raw materials and finished products of Milanese industry. Its terminal point at the wet docks (*darsena*) of Porta Ticinese helped to make that district one of Milan's busiest manufacturing areas, where water mills supplied power to the workshops in which arms, textiles, lumber, and paper were

produced. In the thirteenth century, the Naviglio Grande was connected to the Martesana, a navigable canal that linked Milan to the Adda River, and thus provided Milan with cost-effective transportation between the two great rivers. Additional networks of canals and irrigation ditches brought new lands into production and improved yields in fields already under cultivation. The most famous of these canals was the Muzza, built in the thirteenth century to irrigate the fertile lowlands (*la bassa*) south of Milan.

Indeed, the period from the twelfth century through the fourteenth was the great age of land reclamation in the Po valley. This reclamation was undertaken initially by private individuals, and then, in the fourteenth century, by order of the Visconti. The marshes of *la bassa* were drained and diked, and on these newly reclaimed lands a form of convertible agriculture became established in which arable farming and stock raising were closely integrated. This convertible husbandry was transhumant rather than stationary: every fall shepherds drove cattle, sheep, and goats from the Alpine mountain pastures to the lowlands, and there the shepherds negotiated with local landowners for pasturing rights or the purchase of hay.

Trade in the Po valley was stimulated not only because the vast network of navigable rivers and canals reduced transportation costs, but also because in the course of the twelfth century many Lombard towns began to link their own local weights and measures to those of Milan, thus facilitating market transactions. Moreover, in the late twelfth century and the early thirteenth century, the commune negotiated agreements with communities across the northern plain for free passage along roads and waterways. With the opening of the Saint Gotthard pass c. 1230 and the Simplon pass several years later, Milanese and other Italian merchants could travel more easily to France and Flanders. During this period, Milanese merchants traded less with Germany, because the mountain passes in the eastern Alps were not as accessible. For trade with the Levant and beyond, Milan depended on the great port cities of Venice and Genoa: until the mid-twelfth century it relied on Venice for the acquisition of eastern luxury goods and the export of its manufactures; from the second half of the century onward it traded more through Genoa.

Of the four principal industries in Milan—cloth, arms, metallurgy,

and leather—by far the largest in terms of numbers employed and sheer output was the cloth industry. In terms of profits and reputation, however arms and metallurgy (hardware, utensils, needles) ranked highest. The city had a steady supply of iron from Alpine territories under its control, though it also purchased German iron. In the fourteenth and fifteenth centuries—an age of mercenary armies and constant warfare—Milan's arms industry reached its zenith. Milanese body armor, helmets, crossbows, lances, swords, and other weapons were prized all over Europe and, according to the fourteenth-century chronicler Galvano Fiamma, even by Tartars and Saracens in the east.

Milan produced a variety of textiles—woolens, cottons (*pignolati*), fustians, linens, and silks—of which the most important were woolens. At first the Milanese, like other Italian cloth producers, manufactured woolens that could not match the quality of those from northern Europe, for the wool available locally was inferior to that of England and France, as were the techniques of production. By the end of the thirteenth century, however, Milan was importing high-quality northern wool, and by the fourteenth century the city's weavers were manufacturing a fine woolen cloth (*panno di lana sottile*) that was as much in demand as northern cloths in Mediterranean markets. Less is known about the production of Milanese textiles than about Florentine textiles, but it appears that, unlike Florence, Milan's woolen industry was not strictly controlled by specialized craft guilds, but was largely run by the wholesale merchants who formed a *universitas mercatorum*. The wool merchants (*lanaioli*) were obliged to purchase their wool from members of the *universitas* and sell back the finished cloth to them. Only weavers of woolen cloths and finishers (*cimatori*) were organized into guilds (called *paratici*). During the eleventh and twelfth centuries, Milanese cloth was manufactured in small workshops in and around the city in what is known as the "putting-out" system—but in the course of the thirteenth century, a kind of proto-factory system developed among the Humiliati. Manuscript illustrations from the period depict the Humiliati performing every stage of the cloth-making process (weaving, fulling, shearing, dyeing, etc.) in their monasteries.

After fine woolens—which only the affluent could afford—the most important textile produced by Milanese weavers was fustian cloth. This coarse, heavy cloth, made entirely from Egyptian cotton or from a

mixture of cotton and linen, was used for inexpensive winter garments and served as the poor person's substitute for woolen cloth. By the mid-thirteenth century, Milanese fustians were being sent to the Levant on Genoese ships. Other types of cotton cloths included *pignolati*. The Milanese *contado* also produced linen for export, and a limited amount of linen cloth. Finally, toward the end of the thirteenth century, the Arab art of silk weaving reached Milan, though not until the Visconti dukes actively promoted it—beginning in the mid-fifteenth century—did it become a leading industry in Renaissance Milan. The Milanese leather industry specialized in saddlery, linings for armor, shoes, gloves, and fur clothing.

In contrast to other medieval cities, which had guilds for nearly every artisanal occupation, Milan had only a limited number of guilds (*paratici*). Many specialized workers did not belong to a *paratico*, either because their work did not come under one of the existing traditional crafts or because the Visconti had refused requests for new guilds. At best, such artisans could form confraternities (known as *scuole*), but these were primarily devotional and mutual-aid associations and could do little to defend or promote the economic interests of their members.

Late Middle Ages (1300-1400). By 1300, with a population of at least 100,000 (and very possibly as high as 200,000), Milan reached the peak of its demographic size. Although Milan appears to have escaped the first outbreak of the black death in 1348, it suffered terrible human losses in the plague of 1361. Despite such losses, Milan nevertheless entered a long period of prosperity that was to last for 200 years and was to see it surpass its old rivals Genoa, Venice, and Florence as their economies stagnated or declined. The reasons for Milan's economic success are many, but historians agree that the principal cause was the establishment of the Visconti signory. In the first half of the fourteenth century, the Visconti, as mentioned above, extended their hegemony over many neighboring communes (Bergamo, Novara, Cremona, Como, Lodi, Piacenza, Brescia, Asti, Parma, and, for a short period, Bologna and Genoa), and in so doing they created a more vast and unified economic zone than had existed in the communal age. Furthermore, for the most part, the Visconti backed the interests of the rich mercantile elite against communal or feudal privileges and immunities. Finally, particularly from the late thirteenth century through the fifteenth

century, they spearheaded several initiatives to stimulate economic growth (e.g., drainage and irrigation projects and the development of the silk industry). All the evidence of economic prosperity should not, however, hide the fact that in Milan, as elsewhere during the late fourteenth century and the fifteenth century, the gap between the rich and the poor was growing wider, and that poverty was becoming more visible as vagabonds roamed the streets in search of food and shelter.

Art and Architecture

Architecture: Late antiquity and early Middle Ages (300-1100). For more than a millennium, until the construction of the Gothic *duomo* at the end of the Middle Ages, Milanese bishops celebrated the liturgy in two adjacent cathedrals. The first cathedral (where the present *duomo* now stands) was known as the *basilica vetus, minus, or jemale* because its small size made it ideal for use during the cold humid winters; next to it stood the baptistery of Santo Stefano, where Saint Ambrose was probably baptized. Shortly before 355, another cathedral—*basilica nova, basilica maior, or Santa Tecla*—was built just west of the *duomo*, beneath the current *piazza*, for use during the milder seasons. Archaeological excavations conducted in 1943 and 1961-1962 revealed that this was a large church (some 260 by 150 feet; or 80 by 45 meters) with a nave that could hold almost 3,000 people. Between 1462 and 1548 it was rebuilt twice and demolished three times to make room for the new *duomo*. Attached to Santa Tecla's southeastern side was the octagonal baptistery of San Giovanni alle Fonti (demolished in the mid-fifteenth century), which may have been built by Saint Ambrose and was the site of Saint Augustine's baptism.

South of the Roman walls stood the *basilica Palatina or Portiana* (now the church of San Lorenzo), actually a complex of buildings that included a tetraconch church (a square drum with a tower at each corner) and two attached chapels (Sant'Aquilino and Sant'Ippolito, both probably imperial mausoleums). The base of the entire complex was built using stones from another great building, very possibly the demolished amphitheater. Relatively recent scholarship suggests that it was built not by Ambrose (as was believed for centuries), but by a

fourth-century emperor whose identity is still disputed. Despite being rebuilt several times—first after fires in the 1070s, and again after the dome collapsed in 1573—it remains the finest example of paleo-Christian architecture in Milan. Facing its entrance is one of the few authentic remnants of Roman architecture: sixteen Corinthian columns of a propylaeum.

Beyond the Roman walls to the north, south, and west are the three churches attributed to Saint Ambrose—*basilica Apostolorum* (San Nazaro), *basilica Martyrum* (Sant'Ambrogio), and *basilica Virginum* (San Simpliciano). According to Ambrose's own writings, the first two were consecrated during his lifetime. The date of San Simpliciano, however, is still disputed. There is evidence that Ambrose intended to build such a church before he died (in 397), but some of today's scholars have argued that it may have been built as late as the fifth century. All three churches resemble each other in that they were built on the site of existing graveyards and were endowed with the relics of martyrs. San Nazaro and San Simpliciano were built as cruciform churches; Sant'Ambrogio's original plan is not certain, since the basilica was restructured several times between the late eleventh century and the thirteenth, but it probably had three naves and an apse. The church was built between 379 and 386, and in 397 it became the resting place of its founder. The original atrium was built by Bishop Anspert (868–881), during whose episcopacy the Milanese church was first called the Ambrosian church. The right *campanile dei monaci* ("monks' tower") is all that survives of the ninth-century Benedictine monastery that once stood next to Sant'Ambrogio.

Architecture: High and late Middle Ages (1100-1400). The Romanesque school of Lombard architecture had the most influence on the Italian peninsula; unfortunately, however, Milan's Romanesque churches do not preserve their original form, since all of them were restored over the centuries. Lombard architects typically used red brick, rather than stone (e.g., in Pisa's multicolored marble cathedral—one of the finest examples of Tuscan Romanesque). Two fires, in 1071 and 1075, destroyed or badly damaged a number of Milan's most important buildings and contributed to a wave of building projects beginning in the 1080s. The first of these was the renovation of Sant'Ambrogio, the city's greatest Romanesque church. Between the end of the eleventh

century and first half of the twelfth century, the nave and atrium were renovated and the left *campanile del canonici* ("canons' tower," 1128-1244) was built. The entire church was constructed with rib and groin vaults, round arches, and massive piers—all hallmarks of the Romanesque style. Other Milanese churches originally built as Romanesque churches or renovated in that style include San Nazaro, San Simpliciano, Sant'Eustorgio, Santa Babila, San Calimero, San Giovanni in Conca, San Celso, San Vincenzo in Prato, and San Sepolcro.

Early examples of Milanese gothic buildings include the commune's headquarters, called the *Broletto nuovo* or *Palazzo della ragione*. Begun in 1228 and completed in 1233 by the *podestà*, Oldrado da Tresseno (who is depicted in a bas-relief on the southern wall of the building), it is the largest of Lombardy's public buildings and served as the seat of the "council of 900." It was built with a rectangular open loggia on the ground floor and a single large hall on the second. Across from it stands the *Loggia degli Osii*, built by Matteo Visconti in 1316, a three-story building with Roman and Gothic arches, designed by Tuscan architects.

The largest and most famous Gothic building in Milan is the *duomo*, or cathedral. Begun in 1386 by Archbishop Antonio da Saluzzo and the citizens of Milan, it was supported only nominally by the Visconti and Sforza dukes. To oversee the cathedral's design and construction the citizenry created an administrative body, known as the *Fabbrica del duomo*. The archives of the *Fabbrica* date back to the foundation of the cathedral and represent one of the richest sources for the architectural and economic history of Milan. The *duomo* was made of marble from the lake district north of Milan, rather than from the traditional red brick of Lombardy, and it was designed by Italian, French, and German architects in what is known as the high, or international, Gothic style. The *duomo* is an enormous edifice (the third largest Catholic church in Europe), with five naves and more than 3,400 statues; it took five centuries to complete.

Painting: Early Middle Ages (eleventh century). A distinctive Lombard style in religious painting first developed in the early eleventh century, thanks to a fusion of Byzantine, Ottonian, and local painting traditions, and to the original vision of a several artists. The first distinctive feature of medieval Lombard church paintings was the prevalence of frescoes; Lombardy (unlike Tuscany and the Veneto) did

not produce many wooden altarpieces or crucifixes. More important, the Byzantine influence was less pronounced in Lombardy than in the rest of Italy. Although Lombard painting in the high Middle Ages has many Byzantine characteristics—dark outlining of the figures, almond-shaped eyes, striated drapery—it also has unique expressiveness and realism. There is no exaggerated elongation of figures and faces; faces instead tend to be round, sometimes almost square. A greater naturalism is also evident in the rapid and fluid brush strokes, and in the gestures and arrangement of the figures, which differ from the static, frontal poses and stylized gestures of Byzantine models.

The greatest patron of Lombard art in the first half of the eleventh century—and the man most responsible for making Milan the artistic capital of northern Italy in the Ottonian period—was Aribert of Intimiano, archbishop of Milan. While he was still only a subdeacon of Milan's cathedral, he repaired the church of San Vincenzo (of which he was keeper, or *custos*) in Galliano, a small community between Milan and Como, and commissioned an extraordinary series of frescoes for this church. The influence of Byzantine painting and Ottonian miniatures is clear in the magnificent (but badly damaged) apse fresco *Christ in Glory*, but the Lombard artist deviated from the Byzantine iconographic convention of depicting Christ enthroned, and instead painted him standing upright. Moreover, by painting highlights and shadows instead of the highly stylized folds found in Byzantine drapery, the artist succeeded in giving his figures an authentic shape and volume. In the tier below the apse fresco are *Scenes from the Life of Saint Vincent*, and it is here that this Lombard master's realism is most evident—in the individuality and expressiveness of the faces; in the use of architectural elements not just for decorative purposes, but also to create a sense of depth; and in the natural poses and arrangement of the figures.

The other great Lombard frescoes of the period are those in San Pietro al Monte in Civate (situated between Lecco and Como). Relatively recent studies date these to the end of the eleventh century. In *Heavenly Jerusalem*, painted on the vault of the atrium, the Byzantine style is again present, but the influence of Ottonian miniatures predominates. An enthroned Christ is framed on all four sides by small round faces peering out of arched windows. The most

realistic touches are the two trees flanking Christ; blown by the wind, they bring the fresco to life.

Painting: High and late Middle Ages (twelfth-fourteenth centuries). No masterpieces like those of Galliano and Civate survive from the twelfth century; there are only a few fragments of smaller frescoes (e.g., the *Madonna and Child* in San Celso, Milan). In the second half of the thirteenth century, however, Lombard painting was revived, partly as a result of a new influx of Byzantine works from Venice, and partly by the circulation of northern Gothic miniatures. The Gothic style produced in Lombardy due to the absorption of these outside influences can be seen most clearly in the works of a painter known as the Master of Angera, who appears to have been active in the last quarter of the thirteenth century. The scenes in the Borromeo castle of Angera, depicting Ottone Visconti's victory at the battle of Desio, are a departure from the predominantly religious art of the period. Long thought to have been painted after 1314, these frescoes have more recently been dated to shortly after the Visconti victory in 1277, and as such they represent a more innovative style than was previously recognized. Perhaps influenced by northern miniatures depicting chivalric scenes, the Master of Angera sought to render battle dress and gear accurately, and to express the action on the battlefield by means of the soldiers' turning heads and swinging swords. Several great religious works have also been attributed to this master, including a *Deposition* in the church of San Lorenzo in Milan and a *Madonna and Saints* in the church of San Vincenzo in Galliano. The robust figures in both paintings have an unaffected and noble bearing, which nevertheless is imbued with tenderness. Similar tenderness and naturalness are found in the work of another master, who in 1267 painted a fresco for the tomb of Guglielmo de' Cottis in the church of Sant'Ambrogio. Here, within the confines of a lunette, a Madonna and child converse warmly with three other figures.

In the early fourteenth century, before the dissemination of Giotto's style, the greatest painter of the Lombard Gothic style was the Master of the Fissiraga Tomb (this tomb is in the church of San Francesco in Lodi). Giotto arrived in Milan in 1335 to decorate the palace of Azzone Visconti, although even before his arrival his work had begun to influence local painters, probably through the miniatures inspired by

his style. Nothing survives of Giotto's frescoes for Azzone's palace except a written description by a contemporary chronicler. After the 1330s, Giotto's direct influence can be seen in the works of the younger generation of Lombard painters, such as Giovanni da Milano's wooden altarpiece depicting an assembly of virgins (now in the Uffizi in Florence), and Giusto de' Menabuoi's *Final Judgment* in the abbey church of San Pietro in Viboldone.

Lombard painting, in the form of miniatures, gained international renown at the close of the fourteenth century and through the next century, when the demand of the Visconti and Sforza courts for luxurious books made Milan a center of production of illuminated manuscripts (or *ouvrage de Lombardie*, as they were known in France). The most famous of these, the *Visconti Hours*, commissioned by Gian Galeazzo Visconti and decorated in part by Giovannino de' Grassi, appear to have influenced artists in Tuscany and as far away as France.

Sculpture: Early Middle Ages (600-1100). The great age of Lombard sculpture during the eighth century left little mark on Milan, because Pavia was the chosen capital of the Lombards' Germanic kingdom. A century later, however, an artist named Wolvinus produced the golden altar—the *Paliotto*—over the tomb of Saint Ambrose in the basilica of Sant'Ambrogio. Commissioned by Archbishop Angilbert II (r. 824-859), this masterpiece of Carolingian art is decorated on all four sides with scenes from the New Testament in embossed gold and silver panels, framed by enamels and gemstones. Also from Angilbert's reign is a stucco ciborium above the altar, once thought to have been made during the later Ottonian period. During this latter period (tenth century) Milanese craftsmen, inspired by Byzantine models, produced small, finely carved ivory panels depicting religious scenes.

Sculpture: High and late Middle Ages (1100-1400). There is hardly any trace of Romanesque sculpture in Milan from the first half of the eleventh century, with the exception of a metal crucifix commissioned by Aribert of Intimiano (now in the museum of the *duomo*); but after the mid-eleventh century there was a sudden proliferation of ornamental work for church facades, pulpits, altars, and capitals. Byzantine, Lombard, and Muslim influences can all be found in the animals, vegetation, and geometric interlacing which were the most frequent subject matter; human forms were less common, but examples

are found in the capitals of Sant'Eustorgio and in the pulpit of Sant'Ambrogio.

After the mid-twelfth century, Milanese sculpture went into decline; it was revived in the mid-fourteenth century, however, thanks to Tuscan artists who came to Milan at the invitation of the Visconti and introduced the Gothic style. When Azzone sought an artist who could guide him in his beautification of Milan and execute private commissions, he hired the Pisan sculptor Giovanni di Balduccio (fl. 1318-1349), a student of Giovanni Pisano. Balduccio carved the votive tablets on three gates—the Ticinese, Orientale, and Comasina—as well as the magnificent tomb of Saint Peter Martyr in the church of Sant'Eustorgio (1335-1339). In the early 1340s, Balduccio's workshop produced Azzone Visconti's tomb in San Gottardo in Corte. Although parts of the tomb were subsequently lost and had to be reconstructed, it is clear that Balduccio's original design was meant to celebrate Azzone's military conquests. Surrounding the sides of the sarcophagus are ten kneeling figures representing the ten cities subject to Visconti rule, and behind each of these is a patron saint. Saint Ambrose stands in the midst of these figures and looks on while Emperor Louis of Bavaria makes Azzone imperial vicar of Milan. Atop the sarcophagus lies Azzone's effigy, attended by four mourners. Azzone's cousin Bernabo is the subject of an imposing equestrian monument (before 1363) carved from a single piece of marble by the Lombard master Bonino da Campione. The sarcophagus shows the influence of Tuscan sculpture (especially that of Nicola Pisano) in the fluid lines of the classically draped figures, but the figure of Bernabò astride his horse harks back to earlier Lombard sculpture—it is stiff and beautifully formal.

Literature

Chronicles. The earliest Milanese writings are chronicles by members of the clergy. Arnulf of Milan's *Gesta archiepiscoporum Mediolanensium* covers the period 925–1077, although the main focus is on the years 1027–1077—i.e., from the height of Aribert of Intimiano's reign to the decline of the Patarine movement. The chronicler Landulf the Elder (or Senior), who was born into a family of *capitani* and was

related to the late tenth-century Milanese bishop Landulf, promoted the ideals of his class and his office. Landulf's *Historia mediolanensis* opens with the election of Ambrose as bishop in 374 and closes in 1085, ten years after the death of the Paterine leader Erlembald. Compared with Arnulf's chronicle, Landulf's is full of historical inaccuracies and fabrications; nevertheless, it is a significant work because it presents a stirring defense of the Ambrosian church and its tradition of married clergy and lay participation. Landulf himself was a married member of Milan's higher clergy and a staunch opponent of the Patarines, whom he viewed as subverters of true doctrine. In the twelfth century, another Milanese cleric, Landulf the Younger (or Junior), wrote *Historia mediolanensis*, an account of the early commune (1095-1137).

Fourteenth-century chronicles such as Pietro Azario's *Liber gestorum in Lombardia* record the deeds of the Visconti rulers. The Dominican friar Galvano Fiamma wrote two chronicles—the brief *Manipulus florum* and the longer *Chronicon mains*, of which the fourth book on the Visconti was published separately as *Opusculum de rebus gestis ab Azone, Luchino, et Johanne vicecomitibus*.

Poetry and prose. The most famous of Milan's writers was Bonvesin de la Riva (c. 1240—c. 1315), a teacher of grammar and a member of the third-order Humiliati. He wrote three Latin works, of which the best-known—the panegyric *De magnalibus mediolani* (1288)—presents a vivid and accurate description of the inhabitants, buildings, religious life, culture, and economy of thirteenth-century Milan. Bonvesin also wrote some twenty vernacular poems that are among the first literature written in the Milanese dialect. Of particular interest is his poem *Vulgare de elymosinis*, designed to show how persons in all walks of life may gain eternal life by charitable works. Other thirteenth-century poets include Pietro da Bascapè (or Barsegape), one of the earliest vernacular poets, and the Dominican friar Stefanardo da Vimercate, author of several Latin poems.

Military Orders in Italy

The medieval military orders were associations of knights and other persons who followed a religious rule established by a pope or church council. They embodied ideas about reformed Christianity and ideal knighthood that had gained wide currency by the twelfth century, and they particularly exemplified a link between penitence and warfare that had been developing since at least the time of Pope Gregory VII, in the late eleventh century. The activities of these associations, which arose in the early twelfth century in the context of crusading, were viewed at least in principle as defensive. As organizations of regular religious (that is, as groups of persons who took vows to live by a *regula*, or rule of life), they were unusual in that their normative member was a lay brother rather than a priest. They were also unusual in that these lay brethren were generally warriors and often knights. In addition, they were usually answerable, at least in theory, only to the pope, not to local bishops or abbots.

There were three great medieval military orders: the Knights of the Hospital of Saint John of Jerusalem (the Hospitallers); the Poor Knights of the Temple of Solomon (the Templars); and the Knights of the Hospital of Saint Mary of the Teutons or Germans (the Teutonic Knights). These orders all held property in Italy, whether agricultural, hospital, mercantile, or other. There were also many smaller military orders, which are known at least to have held property in Italy. These include the leper order of Saint Lazarus; the English order of Saint Thomas; and the Spanish orders of Mountjoy, Saint James (or Santiago), and Calatrava. Last, there were several small military orders that were created in Italy itself for one reason or another. These include the antiheretical orders of the Militia of Jesus Christ (in Parma) and the Order of the Blessed Virgin Mary (also known as the Jubilant Brethren, or *fratri gaudenti*); the Order of Saint James of Altopascio; and the sixteenth-century Order of Saint Stephen of Tuscany, founded by Pope Pius IV and Duke Cosimo de' Medici to fight against the Turks.

Major Orders

Because the major military orders were created to defend Christendom from external foes, they did not usually maintain a significant military presence in Italy, despite their widespread holdings. The military orders were not supposed to fight other Christians, so there was little legitimate scope for their military-activities in Italy unless they fought heresy or mounted campaigns from Italian bases against the Turks.

However, they did have a special relationship with Italy from the beginning. The Hospitallers, for example, grew out of a hospice founded in Jerusalem around 1080 by merchants from Amalfi, and there is some evidence that the Amalfitans maintained their connections with the Hospitallers for some time for commercial advantage. Both the Hospitallers and the Templars used the ports of Italy extensively for shipment of supplies, recruits, pilgrims, etc.; and the Hospitallers, in particular, maintained commercial properties to facilitate this traffic in several Italian port cities, including (at various times) Otranto, Taranto, Bari, Messina, Venice, and Barletta. There is some evidence that the Hospitallers even built roads and bridges in support of the pilgrim traffic through Italy to the Holy Land. In addition, the Hospitallers possessed a considerable number of small, mostly scattered agricultural properties across Italy.

Like the Hospitallers, the Templars possessed a number of holdings in Italy. The Templars' banking activities helped to fund various papal activities, and the Templars played a role in papal and Roman politics as well. There is indirect evidence, for example, that in 1294 the Templar master Jacques de Molay may have been involved with Cardinal Benedetto Caetani in obtaining the resignation of Pope Celestine V and in elevating Caetani to the papacy as Boniface VIII. In the last decades of the Temple's life, c. 1300, the order maintained a full-time representative or ambassador to the papal curia, the lawyer and Templar procurator Pierre de Bologna. The Templars were otherwise involved in the religious life of Italy: for example, in the 1260s a Templar named Bonvicino, who was also papal chamberlain, was prominent in the flagellant movement. And the Templars played an important role in the government of Charles d'Anjou in the mid-thirteenth century.

The Teutonic Knights, though primarily a German order, had an important presence in Italy from the beginning, particularly in Sicily,

where their close relationship to the Holy Roman emperor Frederick II in the early thirteenth century gave them properties, privileges, and a role in government. The Teutonic Knights, like the Templars and Hospitallers, divided Italy into administrative regions or provinces, including (among others) Lombardy, Apulia, and Sicily. After the fall of mainland Syria-Palestine to the Muslims in 1291, the Teutonic Knights administered their remaining properties in the eastern Mediterranean, in Cilician Armenia, and in Cyprus from Apulia.

In 1291, the Teutonic order also moved its general headquarters from the Holy Land to Venice. Venice, which was approximately equidistant from the Teutonic Knights' holdings in the Baltic and in the eastern Mediterranean, served as the administrative center of the order for eighteen years, until Master Siegfried von Feuchtwangen moved the headquarters to Marienburg on the Baltic. With the exception of some operations in Latin Greece, the Teutonic Knights did not carry out further military activities anywhere in the Mediterranean theater, leaving it to the Hospitallers and concentrating on the Baltic instead.

In most cases, involvement in Italy benefited the military orders, but in some instances it harmed them. The Hospitallers deposited considerable sums with Florentine bankers, especially the Bardi and Peruzzi, and when these houses went bankrupt in the 1340s, the Hospitallers lost more than 360,000 florins, a loss which took some time to recover. When the Hospitallers and Templars were charged with enforcing papal blockades of trade with Egypt and other Muslim powers, as they were from time to time, they came into direct conflict with the interests of the Italian maritime republics. These powers could, and did, retaliate against the military orders by attacking them or seizing their vulnerable Italian properties. In addition, because the Hospitallers depended on Italian ports for the shipment of supplies, disruptions in the political well-being of Italian states had immediate and negative consequences for them (for example, the Sicilian Vespers of 1282 impeded the Hospitallers' logistics severely).

Minor Orders

In addition to the three great orders (Templars, Hospitallers, and

Teutonic Knights), a number of minor military orders operated to one degree or another in Italy. The Orders of Saint Lazarus and of Saint Thomas, and several of the Spanish military orders, as mentioned above, possessed properties throughout Italy, although there is little or no record of their participation in any military actions there.

There were a few small orders that were created specifically to address situations calling for military action in Italy. Some of these orders blur the distinction between a military order and a lay confraternity, but they also illustrate how military orders evolved over the course of the Middle Ages, and they show the imaginative ways in which the model created by the three great orders could be adapted to suit local conditions.

Two of these military orders were founded in northern Italy to combat heresy. In 1233, a Dominican bishop, Bartholomew of Vicenza, founded an order in Parma that he called the Militia of Jesus Christ, and he attempted to use it both to combat heresy in Lombardy and to bind the Lombard nobility more closely to the church. Members of this order were not obliged to take a vow of chastity (recalling the dispensation granted to the Spanish military order of Santiago), and they were not required to live in communal quarters. Pope Gregory IX gave the order a rule and put it under the religious jurisdiction of the Dominicans.

In 1261, another Italian order was founded to combat heresy: the Order of the Blessed Virgin Mary, also known as the Order of Saint Mary of the Tower and the Order of the Knights of the Mother of God. Its members were commonly referred to as the Jubilant, or Jovial, Brethren—the *fratri gaudenti*—apparently because of their rather casual attitude toward their vows. Pope Urban IV gave this order a rule based on the Augustinian rule; its members—like those of Santiago and the Militia of Jesus Christ—could marry. Like members of the Militia of Jesus Christ, they were not required to live communally. The Order of the Blessed Virgin Mary was charged with keeping the peace in Italian cities, and also with defending the interests of the church. These were obviously conflicting goals, given the partisan nature of Italian politics and religion, and the order was not particularly successful in achieving them. The resentment it aroused was immortalized by Dante, who placed two Jubilant Brethren operating in Florence in the eighth circle

of hell with the hypocrites (*Inferno*, 23).

One other military order was founded in Italy shortly after the end of the Middle Ages. In 1561 or 1562, Pope Pius IV and Duke Cosimo de' Medici founded the Order of Saint Stephen of Tuscany to help resist the advance of the Turks. Locally, for a time, it rivaled and even surpassed the Hospitallers in recruitment; and it played a role in various leagues against the Muslims. Like the Militia of Jesus Christ and the Order of the Blessed Virgin Mary, it departed from the original model for a military order in some respects, particularly in that the dukes of Florence were its grand masters.

These smaller orders were innovative in so many ways that some scholars might consider them hardly military orders at all. But they underscore that: the original impulse behind the foundation of the military orders—a twofold desire to protect the faith and to Christianize laymen, especially warriors—continued on beyond their origination in the eleventh and twelfth centuries, throughout the Middle Ages, in Italy as elsewhere.

It is interesting to note that today the last remaining military order, the Knights of the Hospital of Saint John (now known as the Sovereign Military Order of Malta), is based in Italy; its headquarters are in a villa on the Aventine Hill in Rome.

Mino Da Colle

The comic poet Mino da Colle (late thirteenth century) came from Colle di Valdelsa. He was a distinguished teacher of Latin and rhetoric in the schools of San Miniato, Pisa, Volterra, and Arezzo, and the author of an *ars dictandi*. His sonnet *A buona se' condotto, ser Chiavello* is a bitter invective in the form of the *vituperium*, a theme used often by Rustico Filippi. Mino also wrote the response (*Oi ser Monaldo, per contrario avento*) to a *tenzone* initiated by ser Monaldo da Sofena (*Ser Mino meo, troppo mi dà 'n costa*), in which the two poets hurl insults at each other. The hallmark of Mino's poetic style is his use of equivocal and repeated rhymes, a technique also dear to Guittone d'Arezzo.

Mirabilia Urbis Romae

Shortly before 1143, an unknown author (it may have been Benedict of Saint Peter's) composed *Mirabilia urbis Romae* (*The Marvels of Rome*), a prose description. The first chapters of the text (Valentini and Zucchetti 1946, 3—65; chs. 1—10, 13-14) describe the city walls and then systematically list the gates, triumphal arches, hills, baths, palaces, theaters, places where Roman Christians suffered martyrdom, bridges, cemeteries (catacombs), judges at the Roman court, and obelisks. The second section (chs. 11-12, 15-18) contains six legends connected with some of the principal antique buildings in Rome (the capitol with Augustus's vision of the *ara celi*; the statues of the Dioscuri and of Marcus Aurelius; the Pantheon) as well as legends recalling important facts in the history of Christian Rome (the martyrdom of Abdon and Sennen; the institution of the feast of Saint Peter's chains). The third and last section (chs. 19-31) lists the ancient buildings roughly according to the topography of the city. The popularity of the text throughout the Middle Ages is proved by an impressive number of manuscripts and early prints.

Magister Gregorius's *Narracio de Mirabilibus urbis Romae* (twelfth or

thirteenth century) differs from the *Mirabilia urbis Romae* proper in many ways, and despite their similar titles the two should not be confused. Gregory describes what he saw and heard during his own visit in Rome. He shows a keen interest in individual Roman works of art and describes them at length, whereas *Mirabilia urbis Romae* enumerates monuments without offering many details.

Mirabilia urbis Romae, in its original form, is one of the most important literary examples of the so-called twelfth-century Renaissance, a period during which the antique empire, including Roman art, was seen as an ideal to be sought. Accordingly, the antique rhetorical devices of the *description* and *laudationes urbium* (descriptions and praise of cities) served as a model for the author of *Mirabilia*. These devices allowed the author to embellish and exaggerate certain aspects of the object to be described, so that the border between facts and fiction is sometimes transgressed: for example, he invented antique buildings in places where (during the Middle Ages) no ruins were visible, in order to be able to assign a palace to every important Roman emperor and a temple to each Roman god. However, his aim was not only to show the beauty and importance of ancient, pagan Rome but also to enhance the importance of the contemporary Christian city: the chapters on the catacombs, the places of Roman martyrdom, the vision of Augustus, the Pantheon, Abdon and Sennen, etc. show that Christian Rome was seen as a superior continuation of antique Rome.

Later adaptations of the text often misunderstand its original purposes and use it as a guidebook to the Roman antiquities; for example, John Capgrave (c. 1450) was often at a loss during his search for the buildings mentioned in the text. The ten fourteenth and fifteenth-century Middle English translations of *Mirabilia urbis Romae* still extant (the only adaptations in verse) primarily describe the Roman churches and merely transmit short abstracts from *Mirabilia urbis Romae*.

Modena

The city of Modena, in the region of Emilia-Romagna, dates from the Etruscan period. The oldest name on record, Muthuna, is of Etruscan origin and might be connected to Muthuno, the god of the fields and of fertility; the root *mut* is also found in Etruscan family names of noble origin. The Celtic term *mouden*, which indicates a rising terrain, might also be related to the toponym. At the time of the Romans, the name was transformed into Mutina, and over time there have been other changes, including Motina, Modona, Modana, and finally, in more recent times, Modena.

Modena is situated south of the Po River plain, some 25 miles (40 kilometers) northwest of Bologna, at the conjunction of the Secchia and Panaro rivers. It is about 100 feet (30 meters) above sea level. Located at the edges of two distinct morphological regions—the flat fertile plain stretching south of the Po River, and the northern slope of the Apennines—Modena has from the beginning been a crossroad of major communication and trade routes. Throughout the ages, its strategic position has deeply influenced its history and its economic development.

Prehistoric Times:

From the Etruscans to the Romans

No legend has been handed down about the origins of Modena. At one time, this area was covered by water, which gradually receded, leaving a vast marshy plain. Forests grew and became inhabited by people who lived by fishing, hunting, and agriculture and settled permanently in circular huts. Archaeological studies of the surrounding province indicate the spread of a single typical culture, *terremare*, a term designating characteristic heaps of terrain that are often stratified and contain the remains of abandoned or destroyed villages. Studies of excavations and remains have found evidence of sophisticated

agricultural and breeding techniques in the Neolithic period. Archaeological finds have also shown the remarkable artistic and technical level achieved in the manufacture of ceramic pottery. The Etruscans settled in this area around the sixth century before Christ and did significant land reclamation. Everyday objects, such as pins, buckles, vases, combs, axes, and votive statues, have been collected from numerous Etruscan necropolises surrounding the city and in its provinces (Savignano, Fiorano Modenese, Castelvetro). These objects document the permanent and flourishing influence of the Etruscan people.

In the fourth century before Christ, the entire area between the Secchia and Panaro rivers was invaded by the Gaulish Boii tribe. The Gauls were warrior people of Celtic origin who crossed the Alps in successive waves and settled on both sides of the Po River, driving out the Etruscans, who sought refuge in the mountains. These Gauls ruled this area for about two centuries, assimilating the cultural and economic system that the Etruscans had created and contributing to its improvement.

Wiligelmus, scenes from Genesis: *God in Mandorla*, *Creation of Adam and Eve*, and *Original Sin*. *Duomo* facade (detail), Modena. Photograph courtesy of Christopher Kleinhenz.

The raising of swine was very important to the Gaulish economy.

According to the Roman historian Varro, the Gauls were expert at handling, preserving, and salting pork. The Gaulish army and the majority of the Gaulish population in Italy were fed with pork produced from this region. The Gauls also introduced new agricultural techniques in viticulture (*arbustus gal liots*). When the Romans began to invade and settle in this area in the second half of the second century before Christ, they did not need to experiment with new types of cultivation and breeding, for both had been extensively developed and well exploited.

From c. 225 to 192 B.C., the Gauls fought against the Romans, who had become interested in conquering and settling down in this region. Gradually, the Romans gained power, defeating the Gauls several times. Modena, which had become part of cisalpine Gaul, witnessed a great defeat of the Gauls by the Roman praetor Titus Manlius. After a series of violent battles from 200 to 190 B.C., the Gauls were defeated by the consul L. Cornelius Merula. Under the Romans the Gaulish settlement had acquired the typical town plan of a Roman military camp (*castrum*).

The construction of Via Aemilia by the consul Aemilius Lepidus in 187 B.C. was decisive for the future development of Mutina because it connected Rimini on the Adriatic coast to Piacenza in the middle of the Po River valley. Although initially built for military purposes, the road greatly facilitated trade and exchange of agricultural and pastoral products among all the colonies along it. Via Aemilia also augmented the strategic position of Modena, which became a Roman colony in 183 B.C. A further confirmation of the new importance acquired by the town is that the name Mutina first appeared in a cartographic document of the fourth and third centuries before Christ, the Peutinger Tables. In this archaic map, which depicts the entire road network of the Roman empire, Mutina is indicated by two small houses.

Documents about the Roman colony of Mutina mainly record military events toward the end of the Roman republic. The strategic military position of Mutina was clearly enhanced by its solid city walls, and this fact would explain why the town was often chosen as a stronghold by commanders and consuls. In 77 B.C., several conflicts broke out between Pompeius and M. Giunius Brutus, who was recruiting troops for C. Aemilius Lepidus to move against Rome. In 72

B.C., Spartacus defeated the praetor C. Cassius. In 43 or 44 B.C., immediately after the assassination of Julius Caesar, Mutina was the background for the famous *bellum Mutincuse*. During this war, Decimus Brutus, the appointed ruler of Cisalpine Gaul, was pursued by Mark Antony and was forced to seek refuge in Mutina. Cicero and the entire Roman senate gave strong support to Decimus Brutus and sent the consuls Octavius and Hirtius with their troops to assist him.

The siege of Mutina lasted four months. The account of the phases of the war given by the historical sources (among which is Cicero) is both detailed and fascinating. They relate at length the different stratagems adopted by Decimus Brutus's allies to communicate with him and resupply him with food stocks; among these stratagems was the extensive use of pigeons to dispatch secret messages. Decimus Brutus eventually managed to defeat Mark Antony and break the siege of Mutina, but the outcome of the war was soon overturned. Decimus Brutus was killed while pursuing Mark Antony in Gaulish territories, and thereafter past enemies quickly became new friends. Octavius agreed to join Mark Antony and Lepidus as the second triumvirate. The *bellum Mutinense* succeeded in overturning the political forces of the Roman state, setting the stage for a new political era. Thirteen centuries later, Dante mentioned Modena directly in connection with this war (*Paradise*, 6.75); thus, the war was a clear landmark not only for the history of the town, but for the history of Italy.

The colony of Mutina was rich and flourishing, with monuments, temples, thermal baths, a large forum, and probably an amphitheater. Judging from the refined decorations found on the lead water pipes (*fistule*), the thermal baths must have been very luxurious. Pliny the Elder praised the town as conducive to longer life. From a brief poem of Martial and other literary and archaeological evidence, we learn that one of Mutina's major economic activities was the production, dying, and trading of refined wool fabric. Connected to the wool industry was animal breeding. Every year, from the time of Nero on, an important sheep market was held in Campi Macri (now Magreta), just outside the city walls. The production and trading of pottery and ceramic artifacts continued to distinguish Modena; according to Pliny, these ceramic goods were widely exported. The cultivation of grapevines was further refined and developed, as numerous excavated amphorae and other

wine containers clearly attest. The production and consumption of the famous balsamic vinegar can be traced back to the Roman period. Vinegar, the most potent acid known in antiquity, was largely used to cook and preserve food and to disinfect wounds. Slaves, farmers, and soldiers also commonly quenched their thirst by drinking *posca*, a mixture of water and vinegar. From an agricultural treatise of Columella (first century after Christ), we know that the Romans also prepared cooked must, an economic and easily preserved sweetener that is the fundamental ingredient of balsamic vinegar.

Modena no longer has visible archaeological remains from Roman times; the only examples are parts of monuments and buildings that were built in later periods, such as two lions flanking the main door of the cathedral. These lions came from the Saint Lazarus necropolis in 1200 and were probably part of a sepulcher for a wealthy noble family. Roman necropolises were located outside the walls of Mutina, because of an ancient law that forbade the cremation or interring of corpses inside the town. In fact, most of the monumental sepulchers and memorial stones were found along Via Aemilia outside the city gates.

Early Middle Ages

At the time of Antony's defeat, Mutina was, according to Cicero, a splendid, flourishing, strong, and extremely safe and faithful Roman colony. Four centuries later, in A.D. 388, Saint Ambrose, returning from Bologna to Milan, described with pity and sadness the devastation of all the towns he encountered along his route; among these once splendid and wealthy cities was Modena, now reduced to semidestruction. In a letter to Faustino, Ambrose also observed that the Po River valley stretching from Bologna to Milan, and consequently a good part of the territory surrounding Roman Mutina, was now abandoned and had been left uncultivated. This drastic decline was connected to the overall decline of the late Roman empire, and to the subsequent ruin resulting from the barbarian invasions. The river valley lay at the center of the barbarians' routes as, for more than three centuries, the Goths, Huns, Lombards, and Hungarians descended in successive waves. Whereas Roman Mutina had developed and flourished because of its strategic

military position, that position became a major cause for its rapid degeneration during the third and fourth centuries. The decadence of the city and of its territory was, however, also affected by the deep economic crisis and by the general weakening of all the empire's administrative infrastructures. A direct consequence of this was a total abandonment of the maintenance of roads, buildings, and waterways. The neglect of the waterways soon had fatal effects: natural flooding in 589, 602-604, and 728 submerged and partially destroyed Mutina. Most of the citizens, now ruled by the Lombards, left and found refuge 5 miles (8 kilometers) away along Via Aemilia, on a sort of island that had been spared by the floods. Here they settled inside a fortified village named Cittanova. Only the clergy and the bishop remained in Mutina, to protect the sacred relics of the patron saint; thus, ultimately, it was because of the church that Mutina did not fall entirely into oblivion. For about 150 years, then, Modena was divided into a religious center and a political and economical center—Cittanova.

The evangelization of Modena and of its surrounding territories began around the first century after Christ and lasted three centuries. According to tradition, in the first century, Bishop Cletus erected a Christian church (Saint Peter) on the site where a temple of Jupiter had once stood. The completion of the conversion of Modena was due to Saint Geminian, who was bishop of the town from 358 to 397. Geminian became a legendary as well as a historical figure, and he was the object of a devout religious cult that is still alive today. According to popular belief Geminian sent a blessed, miraculous fog that hid the city from the fury of Attila and the Huns. A ninth-century manuscript of significant literary merit reports two sentinels' songs (*scolte Modenesi*), one of which specifically refers to this episode.

Feudalism

In the eighth century, the Franks took over the Lombard dominion and gradually established a more centralized and efficient administration. Modena continued to be divided, however, until Bishop Leodoino (r. 871-892) obtained permission from the emperor to rebuild the city and its wall. The medieval town did not rise on top of Roman ruins; rather,

its foundation was moved westward to stand on top of what had been a burial ground. More precisely, the medieval center of the town coincided with the grave of Geminian, whose follower bishop Teodulus ordered a church to be constructed on the saint's tomb. As Saint Jerome wrote, the choice of this new site for the foundation of the medieval town was not fortuitous but significant: in a time of confusion and insecurity, the citizens of Modena gathered together and laid the foundation of their town on the symbol of their new spiritual life.

Carolingian rule introduced feudalism, which created a new social and administrative system. While the organization of the countryside was in the hands of lay lords, the defense, fortification, and organization of towns were entirely delegated to religious authorities. Emperor Otto enhanced the bishops' role by giving them absolute power on civil matters. Bishops became the first defenders of Modena, of its citizens, and of its customs. Although the bishop maintained power over the city, Modena and its surrounding territories were officially part of the lands ruled by the Canossa family. For years Modena found itself at the center of the investiture battle, a political power struggle between the religious and the imperial authorities.

Between 1071 and 1091, Bishop Eribert succeeded in enlarging the town with a reconstruction of the city walls, and also in completing the restoration of the waterway system. The channeling of water not only protected the city against devastating floods, but was also very important economically because the canals ultimately connected with the Po River, the main route to the seaport of Venice. The restoration of the canals allowed Modena to strengthen and further develop its trade, thus establishing important relationships with Venice and other towns. The urban structure of medieval Modena developed along the narrow watercourse. Today, the ancient canals can be detected in Modena's toponymy, which includes street names such as Corso Canalchiaro, Canalgrande, and Canalino. Most of the buildings erected during Bishop Eribert's time took on distinct architectural features. The houses of the nobility were fortified palaces, built to offer protection and defense during frequent fights against other factions and other noble families. Common people lived in building blocks with similar dimensions and characteristics. Canals, which served as sewers and dumps, ran behind each block of buildings; streets ran in front. Trading

shops and workshops were on the ground floor; the artisans' living quarters were on the next floor up. Shop entrances were usually covered by wooden porticoes that formed an open-air extension of the shop, offering extra space for exhibiting goods.

The progressive expansion and the reconstruction of the town during this period denote a clear improvement of Modena's economic situation and a profound modification of its politics. Urban economic activities had become significantly differentiated from those of the rural areas. The relationship between artisans, merchants, doctors, and lawyers was no longer based on the feudal structure, and the various crafts were already beginning to organize themselves into guilds, whose power and influence would grow over time. Modena was gradually acquiring the independence typical of a free commune.

The Cathedral

With the rapid economic recovery and the spread of new wealth, citizens felt a need to build a new church that would replace the dilapidated building where the patron saint's relics were still preserved. In 1099, an assembly of civic and religious representatives autonomously made the historic decision to begin construction of a grand cathedral, the *duomo*, dedicated to Saint Geminian. The new *duomo* became the symbol of a city undergoing change. According to an inscription on the facade, work began on 9 June 1099; it was directed by Lanfranco, an architect from Lombardy. Master Wiligelmo designed and supervised the execution of the sculptures and reliefs that decorated the exterior.

The three doors of Lanfranco's original design all have decorations in which a vinelike plant with leaves and tendrils surrounds figures of men, monsters, and animals. Master Wiligelmo and his school of sculptors were able to synthesize the medieval vision of life with a primitive but extremely effective expressiveness. As in Dante's *Divine Comedy*, the wild forest (*selva oscura*) is inhabited by monstrous beings of many species that become symbols of human vices and temptations. Sin is continuously menacing man's spiritual life.

Around the frame of the main doorway, the reliefs gradually disclose

the drama of human life: the believer is caught up in a dynamic struggle against lions, dragons, centaurs, and other incredible monsters that come straight out of the medieval bestiary tradition. Finally, in the architrave and archivolt, happy harvest scenes symbolize man's ascent toward salvation, evoking the lord's vineyard. Life's journey is difficult and full of perils, but the destination is always clear: people in the Middle Ages had to entrust their daily work, fantasies, and fears to divine protection.

Not all of Master Wiligelmo's art is strictly related to religious themes. The most fascinating and puzzling sculptures are those decorating the northern portal, called the *porta della pescheria* because it stood next to the bishop's fishpond. This doorway has scenes from secular life, and the archivolt is decorated with a battle scene: a line of horseman, one of whom is identified as Artus and is freeing the princess Winlogée from a castle where she was imprisoned. These relief sculptures provide evidence that the "matter of Britain" had reached Modena, and the interesting architrave presents animal scenes from Aesop's fables. Carved along the frame of the doorway is a typical theme of Romanesque culture: a monthly calendar portraying the agricultural labors that characterize each month; we see the growing cycle of wheat (sowing in November, harvesting in July, and threshing in August) and grapes (pruning the vines in March, crushing the grapes in September, and casking the wine in October). These scenes indicate a way of life whose rhythm was connected to that of nature, and they also remind the viewer of the bread and wine of the eucharist.

The third doorway—the *porta dei principi* ("princes' doorway") on the south side—combines the story of an ascent to heaven with a depiction of the human condition involving various craftsmen: sculptors, farmers, smiths, etc. In the architrave, a series of cartoonlike scenes tell Saint Geminian's story, showing his horseback ride and sea journey to Constantinople and his exorcism of the daughter of the emperor Giovianus.

On the facade, four stone slabs present stories from Genesis: the garden of Eden, Cain and Abel, and Noah's ark. Through these panels the artist tells a story in images that even the illiterate could understand. According to some studies, the source of these reliefs was not the Bible but an Anglo-Norman sacred drama, *Le jeu d'Adam*.

Surrounding these four panels are figures from the world of medieval symbolism: lions fighting snakes, stags drinking, a man fighting a lion, and two winged cherubs holding torches.

On 30 April 1106, in the presence of Bishop Dodone and Countess Matilda of Canossa, the sacred relics of Saint Geminian were transferred to the new cathedral.

The Commune

For the citizens of Modena, the new *duomo* was not only a place to pray but also a place to conduct discussions and legislate. Although the commune must have constituted itself at least a decade earlier, the first documentation of Modena as an autonomous municipal political and administrative government typical of medieval communes dates from 1135. With the Peace of Constance of 1183, Modena's existence as a free commune received official confirmation as a reward for its having helped to defeat the German emperor Frederick I Barbarossa at Legnano (1167).

A rapid growth in population during the twelfth century forced the city to alter its architectural identity once again. Some urban and suburban districts were newly organized and received new edifices, and on the city walls old gates were replaced by new ones. In 1169, a bell tower, called the Ghirlandina, was erected next to the cathedral; this tower would be extended with a Gothic pointed cone in the next century. (It would also soon preserve the famous "captured bucket," the emblem of the Modena's never-ending petty battles with Bologna, which the Modenese poet Alessandro Tassoni would immortalize in his mockheroic epic poem, *La secchia rapita*.) In 1195, work began on the construction of a municipal palace with an attached tower. The *duomo* and the Palazzo Comunale face Piazza Grande, the town's economic and religious center.

The growth in population, along with the development of trade, also created a need for experts—lawyers and notaries—who could supervise and regulate social intercourse, and this need led to the foundation of Modena's first school of law and rhetoric. The birth of the university suggests the lively cultural and intellectual life of Modena at the time,

and also indicates that Modena did not relish playing second fiddle to any of the other important communes of the Po River valley.

Meanwhile, the corporations or arts and crafts were acquiring increasing political power against the nobles, whose political position was continuously being weakened by internal family enmity and strife. In 1200, the long peaceful period that the Modenesi had enjoyed after the defeat of Frederick I came to an end. During the following two centuries, Modena engaged in a series of battles against neighboring cities; these conflicts undermined its stability and sometimes resulted in a complete loss of its independence.

Even though Modena now sided with the imperial faction (the Ghibellines), the town also had a papal faction (the Guelfs). Enmity toward, and resentment of, Bologna, which was a Guelf city, led to hostilities that culminated in the fatal defeat of Fossalta in 1249. As a consequence, King Enzo, the natural son of Emperor Frederick II, was imprisoned, and Modena was forced to accept Bologna's rule and supremacy for ten years. The heated rivalry between Guelfs and Ghibellines would recur again and again in the following years. In 1288, the city was so exhausted and impoverished that it offered its allegiance to Obizzo d'Este, ruler of Ferrara, in the hope of finding equilibrium and peace. Dominion by the Estense family brought the period of the free commune to an end and marked the beginning of the era of the signory. Except for a brief interruption between 1306 and 1336 (*respublica Mutinensis*), the Este family would rule and control the destiny of Modena until the beginning of the eighteenth century.

Monachus of Florence

Monachus of Florence (d. 1202) was a senior churchman in the crusader kingdom of Jerusalem. He is the ascribed author of an engaging 896-line Latin verse narrative variously called *De recuperatione Ptolemaidæ* (*On the Recovery of Ptolemais*, i.e., Acre or Akko), *De expugnata Accone* (*On the Capture of Acre*), and other versions of these titles. This narrative, written in single-rhymed accentual quatrains called Goliardic stanzas, is an eyewitness account of the Third Crusade from its

preliminaries in 1187 to the conclusion of the siege of Acre in July 1191. It seems, on internal evidence, to be the work of a well-placed Italian participant. Its able versification and possible classical, as well as biblical, intertextuality suggest an author of some literary culture. Passages of emotional involvement on the part of the speaker—e.g., recollections of military setbacks, missed opportunities, and an end to famine among the besiegers—add immediacy to the presentation. The attribution to Monachus comes from a sixteenth-century edition based on a manuscript now lost and is certainly plausible (he is thought to have been the only Latin prelate who experienced the siege in its entirety). However, an attempted ascription to him of a thirty-two-line crusader song in the same widely used verse form seems unpersuasive.

Monachus is identified by later medieval and early modern historians as bishop or archbishop of Acre and is now understood to have been successively chancellor of the patriarch of Jerusalem (1171-1181), archbishop of Caesarea (1181 or 1182 to 1194), and patriarch of Jerusalem (1194-before November 1202). He appears in his charters and in unambiguous contemporary notices simply as Monachus ("Monk," attested to as a personal name in twelfth- and thirteenth-century Florence and Pisa), and he is referred to in papal correspondence by the initial M. During the nineteenth century he was dubiously equated with someone named Haymar or Aymar, a conjecture that has given him many name forms. In English alone, one finds Haymar(us) Monachus, Aymar(us) Monachus, Aymar the Monk, Aimery the Monk, and simply Aymar and Aimery. He has sometimes been considered a member of a Florentine family, the Corbizzi. Several anonymously transmitted descriptive or historical prose writings about the Holy Land were formerly attributed to him.

Monasticism

Monasticism is the pursuit of spiritual perfection and communication with the divine through extreme asceticism—fasting, sexual abstinence, and other forms of personal privation—practiced in isolation from ordinary life. It is cultivated in Buddhism, Hinduism, and Islam, as well as in Christianity. During the early and High Middle Ages, western

Europeans commonly considered monasticism the ideal form of Christian life, most closely imitating the life of Christ and the apostles.

Asceticism was not uncommon among early Christians, but it was usually pursued within the social context of the Christian community. In the late third century, however, new ascetics emerged who separated themselves from ordinary social life, withdrawing to remote locations to pray and fast in isolation. New terms were coined for them: monk (*monachos*, one who lives alone), eremite (desert-dweller), and anchorite (one who removes himself). They appeared first in Egypt, settling in caves and abandoned buildings in the desert bordering populated areas. They professed to teach Christians how to deal with the world's distractions, and they took as their model Christ, who in the gospels had gone into the desert to fast and pray. As the monks' reputation for holiness spread, they drew vast crowds when they preached, again in imitation of Christ.

By the turn of the fourth century, there were whole colonies of both male and female anchorites at various locations in Egypt. Members of these colonies pursued their devotions privately in cells just out of sight of one another. They gathered only for communal prayer on Saturdays and Sundays, and for occasional instruction from spiritual guides. Gradually, small complexes of common buildings emerged: a church for group services, a bakery, and sometimes guest houses and other facilities to control the flow of visitors. The leader of a community—called father (*appa*) in male communities or "mother" (*amma*) in female communities—required the followers to work to provide the group with basic necessities, usually through the manufacture of small items that could be bartered locally by agents.

The fame of the Egyptian monks spread rapidly in the early fourth century. Of great influence was the *Life of Saint Anthony*, a biography of one of the most charismatic early hermits written by the famous Alexandrian patriarch Athanasius. Soon hermits appeared throughout the eastern Roman empire, often practicing extravagant forms of penance. Even before Athanasius's landmark work was written, however, a new mode of monasticism was developing. Pachomius, a Roman soldier who had embraced the monastic life, established at Tabennisi along the upper Nile the first group of Christian monks to live as cenobites, or community-dwellers, c. 320. Pachomius had tried to

live for some years as an anchorite, but he had finally concluded that asceticism was more easily and safely pursued with the support of a community of monks working together within the organized framework of a rule. His rule, which greatly influenced western European monks, emphasized fellowship among the members of the community and obedience to superiors, as well as a careful structuring of the monk's routine to balance communal prayer, private meditation, and manual labor. It limited heroics in penitential practice, but compensated by providing a stable spiritual environment for the psychologically taxing life of the monk. Tabennisi contained separate communities of men and women. By the time Pachomius died, in 346, he and his followers had founded many cenobitic monasteries along the upper Nile. His female communities were strictly enclosed; that is, removed from contact with the rest of the world. This would become an identifying feature of female monastic communities by the late Middle Ages.

A pivotal figure in the development of cenobitism was Basil of Caesarea. He visited both eremitic and cenobitic settlements in Egypt during the late 350s, then returned to his native Asia Minor to put what he had learned into practice. After several experiments he concluded that the best form of monasticism was organized cenobitism. The cenobitic community he founded at Caesarea became the model for many other monasteries in Asia Minor. His longer and shorter "rules"—really sets of precepts in question-and-answer form—created the dominant guide for later cenobitic communities: a spiritual family living in a single household, rather than the sprawling camps of Pachomius. Basil also strongly affirmed Pachomius's emphasis on obedience to superiors and manual labor as vital spiritual aspects of monastic life. Basil's rules proved decisive in the development of monasticism in the eastern Mediterranean and were extremely influential in the evolution of cenobitism in the west.

During the fourth century, monasticism spread throughout the eastern Roman empire and into the west. In the east, both cenobites and eremites flourished. Monastic centers often featured hermits living close to cenobite monasteries, as at Mount Athos in northern Greece. In the west, too, there was initial interest in both ways of life. Literature about the "desert fathers," especially *The Life of Saint Anthony*, and the direct

reports of pilgrims and religious refugees from the east, such as Athanasius, Hilary of Poitiers, and John Cassian, stirred considerable enthusiasm. Italy was first affected; Rome, Aquileia, Milan, Bologna, Verona, and Vercelli became monastic centers. Soon important religious leaders—among them Evagrius of Vercelli, Ambrose of Milan, and Augustine of Hippo—were promoting the movement. Others, such as Marcella, Melanie the Elder, and Marina, founded influential monastic communities. By the late 300s, monasticism had spread to Gaul. At about the same time, monasteries began to be brought under the control of the local bishops in order to eliminate potential friction between monastic leaders and diocesan clergy. Augustine of Hippo and others went so far as to assert that the proper life for a bishop was monastic, and monks soon became favored candidates for vacant bishoprics.

In the fifth and sixth centuries, monasticism spread to many other parts of the western Roman empire, even as Rome's political authority disintegrated under the pressure of the barbarians' invasions. Western monasteries experienced novel challenges in the chaotic environment of a dissolving empire; often their survival depended on material as well as spiritual self-sufficiency. As a result, during the fifth century, Italy and Gaul became centers of cenobitic experimentation. The fruit of these experiments was the rule composed c. 520 by Benedict of Nursia, a brilliant synthesis of earlier efforts. Benedict's masterful collation eventually became the dominant rule observed in western European monasteries. The community that Benedict's rule described was not easy to enter; only after a year's postulancy would an applicant be admitted, and then he had to take a vow to remain for the rest of his life at the monastery to which he applied. He also had to vow chastity, poverty in common, and obedience to the monastery's abbot. The Benedictine rule was moderate in the privations it enjoined on the monks, but it stipulated constant occupation with prayer, study, or manual labor. The order and industry imposed by the rule ensured that Benedictine monasteries would prosper despite external upheavals.

For several decades, Benedict's rule was observed only at the monasteries he founded: iMonte Cassino, Terracina, and Subiaco. But in 577 the monks of these monasteries dispersed to escape marauding Lombards. When some settled in Rome, their discipline attracted considerable attention. One of their greatest admirers was Pope

Gregory I. His personal influence and the popularity of a *Life of Saint Benedict* that he wrote c. 594 ensured the spread of Benedict's rule in Italy. Gregory also sent Benedictines as missionaries to pagan England in 596; their success led both to the spread of Benedictine monasteries in Britain and to the founding of a vibrant missionary tradition among Benedictines. In the seventh and eighth centuries, English Benedictines revived Christianity in Gaul, converted the Low Countries, and moved into western Germany. From there they migrated east and north, reaching Scandinavia by the mid-tenth century.

Benedictines were not the only missionaries. Monks from the eastern Roman empire converted great numbers of Goths in the fourth century, and Gallic monks Christianized the Irish in the fifth. The converted Irish carried on the missionary tradition brought to them from the continent. In the sixth century, Irish monks attempted the conversion of northern England and southern Scotland. Meanwhile, Irishmen such as Columbanus revived Christianity in Merovingian Gaul and northern Italy, founding many monasteries in the process. These Irish monasteries were especially successful in converting the rural populations of Italy and France, which until then had remained obstinately pagan. Later they pioneered the conversion of Germany. Through their missionary efforts, Benedictine and Irish monks helped make Christianity the basis of a common European culture in the Middle Ages.

As important to Europe's cultural identity as the monastic missions were monks' efforts to preserve classical learning. Early monks had been generally illiterate and suspicious of the pretensions of learning, but the adoption of monasticism by the Christian intelligentsia in the fourth century brought a profound change. Meditation on the written word of scripture became a fundamental monastic exercise. Because Jerome, Augustine, and other prominent theologians insisted that the multifaceted meanings hidden in divine revelation could be understood only by exegetes sufficiently learned to decipher complex allegories and metaphors, it became an accepted principle that monks must be as educated as possible. This led western monks of the late Roman era—faced with the imminent collapse of urban educational systems as the empire crumbled—to seek intellectual self sufficiency by creating their own schools, libraries, and book-copying facilities. In the process, they

saved classical scholarship from oblivion. Monastic libraries and *scriptoria* preserved an enormous portion of ancient Rome's prose corpus when it was lost elsewhere. By the late seventh century, monasteries had become the center of western Europe's scholarship. Bobbio, for example, founded by Columbanus in 613, was the dominant cultural force in Italy between the eighth and twelfth centuries; and the era's greatest scholars—figures such as Theodore of Tarsus, Hadrian of Canterbury, and Bede of Jarrow—were all monks.

Monastic culture was especially vigorous under the patronage of the Carolingian kings of the eighth and ninth centuries. Most of the scholars at Charlemagne's court were monks, including his chief adviser, Alcuin. Conscious of the benefits of learning, Charlemagne and his successors attempted to ensure a continued level of education and devotion at the monasteries of the empire by regulating and occasionally reforming them. As a result, Carolingian monasteries produced several generations of distinguished scholars, notably Rabanus Maurus and Walafrid Strabo, whose comprehensive biblical commentaries profoundly influenced the direction of later scriptural exegesis. Carolingian monks also concentrated on the copying of decaying classical manuscripts to ensure that the cultural canon salvaged by previous generations of monks would not be lost. Their energy and effectiveness are revealed in a startling fact: for 90 percent of the classical works still in existence, the oldest manuscript is one of these Carolingian copies. These were the manuscripts that permitted the rediscovery of the classics during the renaissances of the twelfth and fourteenth centuries.

As the Carolingians reformed their monasteries, they also succeeded in regularizing them, at least to some degree. Especially effective was the Benedictine zealot Benedict of Aniane, who in 816 attempted to impose a uniform monastic observance on the entire Frankish empire. In order to implement his reform, Benedict was given the position of abbot general of all the monasteries between the Loire and the Meuse by the emperor Louis the Pious. Although Benedict's rigid program of monastic standardization was never fully realized, it did ensure that the Benedictine rule would become a universal model for reform in western Europe during the next several centuries.

When the Vikings, Magyars, and Saracens attacked western Europe

in the late ninth century and early tenth century, monastic observance deteriorated drastically. The decline spawned numerous reform movements. By far the most successful was that begun with the establishment of the Burgundian monastery of Cluny in 910. Cluny's founders thought they were reviving primitive Benedictine ideals; in fact, they were restoring the program of Benedict of Aniane, which included many liturgical activities not found in the original Benedictine rule. As a result, Cluniacs spent a great deal of time in the chapel, and virtually none at manual labor, which was now done by servants. Cluny's founders also followed Benedict of Aniane in maintaining the authority of the abbot of Cluny as abbot general of all monasteries founded by Cluniac monks. Neither practice was an aspect of the original rule of Benedict of Nursia, but both practices made the Cluniacs popular and effective. The Cluniacs' emphasis on liturgy drew the attention of a laity concerned to control divine wrath through prayer and ritual, and the careful supervision exercised by the abbot of Cluny over daughter houses ensured full observance of the rule when this was a rarity at monastic houses. To avoid interference from local bishops and lay authorities, Cluniac monasteries placed themselves under the protection of the Holy See. Cluny's reputation for observance of the rule led many other monasteries to seek annexation: it is estimated that by the late eleventh century more than 1,000 monasteries in France, Italy, Spain, and England professed allegiance to Cluny.

Cluny's influence on monasticism extended beyond its daughter houses. The Peace of God and Truce of God, movements sponsored by Cluniacs and intended to pacify fractious Christian warriors, popularized the notion that knights were protectors of Christians in the physical realm, as monks were in the spiritual—that both had a vocation to be "soldiers of Christ." This inspired some knights during the crusades to establish orders of warrior-monks bound by vows of common poverty, chastity, and obedience, and pledged to defend the recently captured Holy Land. The most prominent of these orders were the Templars and Hospitallars.

The Cluniacs' emphasis on the liturgical dimension of the monk's life, to the exclusion of manual labor, and the enormous wealth eventually accumulated by Cluniac monasteries, drew admiration in the tenth century but criticism by the twelfth century. In the interim, new

notions of monastic spirituality developed that idealized the primitive life of the early Egyptian monks. Italy led the way in the early eleventh century with an eremitical revival. The founders were Nilo of Grottaferrata, a Greek-speaking Calabrian who was influenced by Basil of Caesarea; and Romuald of Ravenna, a Cluniac who had been drawn to eremitism after reading the lives of the desert fathers. The thirty-odd monasteries Romuald founded, which later formed the Camaldolese order, had particular influence. The Camaldolese Peter Damian became a prominent Gregorian reformer and was able to enlist the support of the papacy for the new austere monasticism. In 1038, Giovanni Gualberto of Florence, another dissatisfied Cluniac, founded a monastery at Vallombrosa that combined literal observance of the Benedictine rule with complete seclusion from the outside world. Giovanni achieved this through the introduction of lay brothers—professed monks who specialized in administration of the community so that others might be isolated from society. Later, this practice was widely imitated by reforming orders. The spirit of monastic reform in the eleventh century also extended to secular clergy. Many began to organize themselves into houses of canons regular under the rule attributed to Augustine of Hippo. This allowed them to fulfill diocesan functions while renouncing individual property and participating in a monastic community. The practice began in northern Italy and southern France but quickly spread to the rest of Europe.

In the early years of the twelfth century, the Italian eremitical movement began to influence monastic reformers north of the Alps. The Breton Robert of Arbrissel founded a double monastery of hermits, male and female, at Fontevrault. Stephen of Muret in Auvergne was inspired by the hermits of Calabria to found a similar order at Grandmont. Stephen borrowed Giovanni Gualberto's practice of using lay brothers to run the monastery so that the monks might be free of mundane concerns. Also influenced by Italian practice were Bruno of Cologne and Guignes de Pin, who established a group hermitage at Grande Chartreuse in the Alps, and Norbert of Xanten and Hugues de Fosses, who founded a double house for canons and canonesses at Prémontré near Laon. They too used lay brothers to run their houses.

The twelfth century's most successful attempt to recapture the primitive life of the monk was the Cistercian order, founded in

Burgundy by Robert of Molesme. Robert sought a more primitive Benedictinism that rejected corporate wealth and restored the manual labor and private meditation abandoned by the Cluniacs. His Cistercians also refused to accept child oblates; reinstated the yearlong Benedictine novitiate abandoned by the Cluniacs; used lay brothers on a large scale to ensure the monks' enclosure; and practiced simplicity in housing, food, and drink. The order was moved from Molesme to Cîteaux in 1098 and grew quickly with the arrival of the energetic Bernard of Clairvaux in 1112. Several monasteries were established in France by 1120; in Italy houses were founded at Locedio and Santa Maria del Tiglieto in the 1120s, and at Chiaravalle near Milan and Tre Fontane in the Roman *campagna* in the 1130s. From there, Cistercians moved rapidly into Lombardy and the Veneto. The first abbey in England was established in 1132.

The Cistercians soon became the dominant religious force of the century. This was due in large degree to their austerity, but other factors also played a part. Bernard of Clairvaux's powerful moral voice, which had made him an international figure, lent his order enormous prestige. Aristocrats and the new university intelligentsia drawn to the elite image of the Cistercians provided highly trained and influential recruits. And the order's centralized organization, borrowed from Cluny but implemented with a new and distinctive device, the general chapter, enabled Cistercian leaders to regulate each monastery's activities closely.

The great success of the Cistercians irritated the Cluniacs, who felt they were being criticized. This "crisis of cenobitism" prompted strong exchanges, especially between Bernard of Clairvaux and the Cluniac abbot Peter the Venerable, but it also brought reforms to Cluniac monasteries in the 1130s. And even as Cistercians and Cluniacs quarreled, Cistercian practice began to decline. Popularity and rapid expansion led to huge endowments; the endowments required hardheaded management; and by the end of the twelfth century the Cistercians had developed a reputation for acquisitiveness as well as devotion.

Perhaps as damaging to the Cistercians' image as their new wealth were rapid changes in notions of holiness. In the late twelfth century, broad social and economic shifts—particularly the growth of towns—

altered concepts of apostolicity. The apostles were now seen by many townsmen as wandering preachers with no possessions who had begged for their sustenance. In comparison, the seclusion of the cloister seemed a lesser calling. These ideas motivated several mendicant groups during the late twelfth century. The earliest of them—the Waldensians of Lyon and Humiliati of Milan, for example—met with condemnation by conservative churchmen. But fear of rapidly growing heresies like Catharism, which were benefiting from the laity's new respect for the poor preacher, led progressive clergy to reconsider the value of mendicancy. Pope Innocent III approved Francis of Assisi's Friars Minor in 1210; Honorius III confirmed Dominic Guzman's Order of Preachers in 1216. The effectiveness of both orders at preaching and promoting religious revival among the laity soon made them the most popular in the church, and the most favored by the papacy.

The success of the Franciscans and Dominicans inspired others to follow their lead. In the 1240s and 1250s, the Carmelites, originally established as a monastic order in the Holy Land, reorganized as a mendicant order. In 1256, groups of hermits from Romagna, Tuscany, and Lombardy who sought a preaching apostolate in nearby cities were constituted as a new mendicant order—the Augustinian Friars Hermits, or Austin Friars. Both were extremely successful. Lesser orders influenced by mendicant ideals were the Servites, the Friars of the Sack, the Crutched Friars, and the Trinitarians.

The same forces that created the apostolic movement and the mendicant orders brought greater autonomy to religious women. Female religious houses had been prominent among the pioneering monastic institutions of the fourth century. Most were enclosed, as were male monasteries in that early period, and most were directly controlled by their abbesses, just as male monasteries were controlled by their abbots. But abbesses' autonomy ended with the Carolingians; later, feudal nobles and kings tried to bring nunneries under the authority of male supervisors. Consequently, the independent women's houses founded by reformers like Robert of Arbrissel and Norbert of Xanten during the eremitical revival of the tenth and eleventh centuries quickly passed under male supervision. But the apostolic enthusiasm of the thirteenth century created a different environment. Cistercian convents, the Poor Clares founded by Francis's friend Clare of Assisi,

and the female houses established by Dominic Guzman all asserted a good deal of independence, much to the discomfort of some male authorities. The Beguines, groups of devout laywomen living in semimonastic communities, were actually able to pursue an active apostolate, at least until they were brought under clerical supervision in the early fourteenth century. During the fourteenth and fifteenth, centuries female religious groups continued to assert their autonomy, with mixed success.

In the fourteenth century, monastic life suffered a serious decline. Mendicants lost some of their luster, developing a reputation for laxity. The institutional wealth that popularity had brought now weighed against them, as did embarrassing public quarrels over the proper observance of apostolic poverty. Equally damaging was hostile propaganda broadcast by secular clerics who were envious of the mendicants' status. The image of the greedy, gluttonous, and lascivious friar so familiar in later medieval literature was created at this time. Among cenobites, especially Benedictines, the major cause of decline was a fading of popular enthusiasm for institutions that specialized in liturgical celebration. The new, more interior spirituality heralded by the mendicants, tertiary movements, and lay mysticism left many laymen uninterested in supporting an old-fashioned piety. Falling endowments and an agricultural recession in the fourteenth century restricted income. To maintain what they considered a proper standard of living, many monasteries limited their membership. Laxity of observance created further difficulties, as the laity was becoming increasingly critical and spiritually self-reliant.

Major monastic and mendicant orders survived this late medieval crisis, but with diminished numbers. Some Benedictine houses attempted to restore discipline during the fifteenth century by grouping their houses into highly centralized congregations like that of Santa Giustina in Padua. Their success provided a model for the more systematic monastic reform that came in the wake of the Reformation.

Monophysite Controversy

The Council of Nicaea (325) had determined that Christ was both human and divine. However, the question of how to conceptualize that union remained.

This controversy began as part of a struggle for power and intellectual ascendancy between two of the great sees of Christendom, Antioch and Alexandria. Alexandrians stressed the divinity of Christ, and Cyril, bishop of Alexandria in 430, vigorously forwarded that view and rebutted the Antiochene, Nestorius, who stressed Christ's humanity. Cyril claimed that there was only one incarnate nature of the divine word, and that any other formula which mentioned two natures represented Nestorianism.

By the second half of the century, many extreme Cyrillians insisted that in the incarnated Christ, human nature had become completely absorbed in the divine, so that only the divine nature was left. These

became known as the Monophysites—a term that means believing in one nature. Eventually, both extremes—Nestorians and Monophysites—would be found heretical.

In 449, Pope Leo I issued a *Tome* that expressed the Christology of the west. Leo said that both the divine and the human nature existed in one person, Christ, without confusion or mixing. The west accepted this explanation, but the Monophysites refused it because it claimed two natures in Christ.

The Council of Chalcedon met in 451 to define the nature of Christ in a way that might unite the opposing parties. The council read and approved Leo's *Tome* and used it as a basis for a new definition. According to the council, there were two natures united in one person, yet each nature retained in full its respective characteristics. This definition satisfied the west, where Monophysite ideas had never found much welcome; but in the east, for various cultural and regional as well as ideological reasons, large sectors of imperial territory were strongly opposed to the "orthodox" position of the Council of Chalcedon.

Monophysites wanted a return to Cyril's single-nature formula, and the resulting dispute involved emperors, churchmen, and the faithful for the next two centuries. In 482, the eastern emperor Zeno issued his *Henotikon* to attempt the first doctrinal compromise by decree. This led to the first schism between east and west when, in 484, the patriarch Acacius of Constantinople and Pope Felix III excommunicated each other. The schism lasted until 518, when the Chalcedonian emperor Justin I took the throne and pressed for a reconciliation between pope and patriarch.

Monophysitism was particularly strong in Syria and Egypt, and by the sixth century there was a separate Monophysite hierarchy in Egypt. Justinian I vacillated between staunch Chalcedonianism and schemes for a compromise, but his unremitting efforts made the conflict more bitter and more divisive. For another century, emperors and patriarchs continued efforts to satisfy the dissidents, who nevertheless remained intransigent. Sectarianism and regional dissent assisted the Persians in their brief seizure of Syria-Palestine and Egypt in the early seventh century, and seem even more to have assisted the decisive conquest by the Muslim Arabs in the 630s. With the loss of the territories where Monophysite sentiments were most strongly entrenched, opposition to

Chalcedonian orthodoxy in remaining imperial lands all but collapsed. The Sixth Ecumenical Council of Constantinople (680) condemned Monotheletism, the last of the imperial compromise doctrines. Monophysitism effectively died out in the eastern empire, though some scholars find traces of its posthumous influence in Iconoclasm

Monreale

Monreale—"royal mountain"—is a town created by a church, situated on a high shoulder over the Conca d'Oro of Palermo.

The young William II (1166–1189), eager to continue his predecessor's patronage of building and art, was inspired (it is said) by a dream in which the Virgin Mary indicated a place where he was to build her church, and the whereabouts of a hidden treasure with which to finance it. (A further motivation, however, may have been William's competition with the contentious archbishop of Palermo, Walter of the Mill, who was then rebuilding Palermo's cathedral.) William's church was begun in 1172 and was dedicated in preliminary form in 1176, but some construction went on into the next century, and the church was not formally consecrated until 1267. Though William did not live to see it fully completed, he pressed forward with its essential decoration, taking a personal interest, and he was rewarded in 1182 when Pope Lucius III elevated the original monastic foundation to the status of an archbishopric. Thereafter, the surrounding town evolved around it over the course of time.

The church's facade, dominated by two grand towers, includes a subsequent eighteenth-century portico but has a splendid pair of bronze doors signed by Bonanno da Pisa and dated 1185. The sixteenth-century portico on the north side frames another bronze door by Barisano da Trani (1179). The interlaced arcading of the facade is eclipsed by the vivacious stone decoration in Arab-Norman style on the apse exteriors.

William II Presenting the Church to the Virgin (detail). Cloister, *duomo*, Monreale. Photograph courtesy of John W. Barker.

The majestic nave is lined with Roman columns, leading to an elevated choir platform; the lower walls are lined in marble, with characteristic bands of abstract Arabic decoration. In the south transept are the tombs of William I (in a fine porphyry sarcophagus) and William II (in a later casket of white marble made in 1575); in the north transept are the reconstructed tombs of William I's wife and two other sons, as well as a shrine to Saint Louis (King Louis IX of France), containing his heart. The wooden ceiling, partly restored, is decorated in Islamic style.

The cathedral's glory is its extensive mosaic decoration, completed in 1182 as an expansion of themes in the Palatine Chapel (Cappella Palatina) in Palermo. In two sequences between the nave windows and over the nave arches, and running consecutively from the south side around the west wall and through the north side, the mosaic scenes present the stories from Genesis, beginning with the phases of the creation and running through the story of Jacob. On the walls of the side aisles, the mosaics depict episodes in the life of Christ. Christ's passion is shown on the walls of the choir, and episodes in the preaching of saints Peter and Paul are likewise mounted, in relationship

to the portraits of each saint enthroned in the conches of the side chapels. In the main apse conch is the third of the great Byzantine-Norman mosaics of Christ the Pantocrator; below this figure is seen the enthroned Virgin with archangels and apostles; and below the Virgin is a series of saints on either side of the apse window. The middle figure on the right is Saint Thomas Becket—this is one of his earliest portraits, made soon after his death (1170), on orders of King Henry II of England, who was William II's father-in-law. In the sanctuary before the altar are two mosaic panels of explicit political statements. On the north side, over the place for the king's throne, William II is shown in Byzantine imperial garb receiving the crown from Christ—in imitation of an earlier portrait of Roger II in the church of the Martorana in Palermo. On the south side, over the place for the archbishop's throne, William II is shown offering the building to the Virgin in fulfillment of his pledge.

Augmenting the splendor of the cathedral itself is the adjacent cloister, another marvel of Norman synthesis of Islamic and Christian aesthetics. Its large circuit of 228 double columns shows endless ingenuity in the diversified decoration of the columns themselves, and in the symbolic or narrative representations on their capitals: Bible stories and allegorical subjects; portrayals of William's vision, vow, and presentation of the cathedral to the Virgin; and even a stylized representation of the *trinacria*, the age-old symbol of Sicily. To cap it off, there is a delightful Moorish loggia with a fountain in the cloister's southeast corner.

The Monreale cathedral is one of the most remarkable artistic creations in all of medieval Europe.

Montaperti, Battle of

The *castello* Montaperti, situated along the Arbia River east of Siena, gave its name to a decisive battle in which a large army of Guelfs led by the Florentines was defeated by the Sienese on 4 September 1260.

Plain of Montaperti, with monument to the battle on the top of the hill.

Emboldened by the Sicilians' coronation (1258) of Manfred, son of Frederick H, Florentine Ghibellines had fled to Siena after an unsuccessful revolt, and they and the Sienese Ghibellines had prepared to challenge the Florentine Guelfs' domination of Tuscany. Having offered fealty to Manfred, in May 1259, Siena received a small contingent of royal cavalry, which was reinforced in December by a larger force commanded by the new vicar-general for Tuscany, Giordano d'Anglona.

Successful attacks in the early spring of 1260 by Sienese and Hohenstaufen forces on Tuscan Guelf towns resulted in a futile assault

on Siena by Florence in April. By August the Florentines had recovered and prepared another expedition (outlined in the *Libro di Montaperti*). Joined by troops from Bologna, Prato, Pistoia, and Arezzo, the army marched on Siena, gaining more men along the way from San Miniato, Volterra, and San Gimignano. All told, about 20,000, including 2,000 knights and 1,000 crossbowmen, camped along the Arbia on 3 September.

The Sienese, whose patron saint was the Virgin Mary, had prepared for battle both militarily and psychologically. Religious rituals and patriotic demonstrations were intertwined, and Salimbene dei Salimbeni pledged 118,000 florins to pay the mercenary cavalry. On the morning of 4 September, the Sienese formed four corps, keeping one in reserve and one concealed on the Florentines' left. Two corps, led by counts Giordano and Aldobrandino, charged across the Arbia and engaged the Guelfs. The fresh Sienese troops that were held back probably decided the battle, but a treacherous act by Bocca degli Abati caused the Florentine standard to fall and disheartened the Guelph cavalry, which fled the field. According to the Florentine chronicler Giovanni Villani, the abandoned infantry were slaughtered until the survivors surrendered, and according to Dante the battle was a "massacre and butchery that stained the waters of the Arbia red" (*Inferno*, 10).

Montaperti marked the high tide of Tuscan Ghibellinism. Florentine Guelfs fled to Bologna and Ghibellines returned to rule; most of Tuscany then surrendered to Manfred, and Rome and the papal states fell into his hands. However, Manfred's death in 1266 ended the Ghibellines' hegemony.

Monte Andrea Da Firenze

The poet Monte Andrea da Firenze (fl. second half of the 1200s) was a fervent Guelf, and probably a money changer whose possible bankruptcy is alluded to in Guittone's letter to "Montuccio," *Bono e diletto amice* (Meriano 1923, letter 3). Numerous *memoriali bolognesi* place Monte in Bologna between 1267 and 1274. Much of Monte comes to light through poems exchanged in *tenzone* with at least eighteen correspondents, including Chiaro, Ser Monaldo da Sofena, Meo Abbracciavacca, and Pallamidesse di Bellindote.

According to manuscript Vatican Latino 3793, Monte is one of the three most important Tuscan poets of the *Duecento* before Dante (the others are Guittone and Chiaro). With few exceptions, Monte's 112 sonnets—most in his distinctive sixteen-verse form (10 + 6)—and eleven *canzoni* disclose a poetics characterized by hermetic syntax and extended experiments in equivocal, compound, and derivative rhyme. The rhetorical severity of his verses, described by his contemporary Puccio Bellondi as *del dragon maniera*, underscores their usually dark, sarcastic content: Monte's themes are misfortune and the socioeconomic realities of the political hegemony of wealth—*secondo il corso del mondo mess'ò* ['n] *rima* (*Tanto m'abonda*, verse 146). These two themes distinguish Monte's ethic from Fra Guittone's moralist vision. Monte's political expressions never aspire to the idealism of Guittone's *Ahi lasso, or è stagion* (in *Fiorenza, fior che sempre rinovella*), but they evince a sometimes violent partisan voice—e.g., *lagente ch'è contra Carlo fera; a' qua'/tor[r]à la vita!* (in *Coralment'ò*).

Monte's dissociation from Guittone is spelled out in their exchange of sonnets (*A te, Montuccio* and *Poi non son sag[g]io*).

There is little doubt that Monte had strong ties to the poetic traditions of Bologna, both through his poetic correspondence and through his travels. Monte's oeuvre includes echoes of Guinizelli's protostilnovist *Al cor gentil* (in the sonnet *Qui son fermo*); elements of erotica (*Oi dolze Amore* and *Di svariato colore*, in *tenzone* with Paolo Zoppo di Bologna); and widely diffused Occitan-Sicilian motifs (*Poi che lo ferro, la calamita, sag[g]ia*). Yet Monte's handling of these concepts and features always seems adapted to his signature of complicated prosodic experimentation, making him the Tuscan champion of the *trobar clus*.

Monte Cassino, Monastery of

The monastery of Monte Cassino, situated about halfway between Rome and Naples, is the second monastic foundation of Saint Benedict of Nursia, established c. 525, after Benedict's migration from his foundation at Subiaco. Benedict is thought to have written his rule—a document of primary importance in the history of western monasticism—at Monte Cassino; and he and his sister, Scholastica, are thought to have been buried there. According to Book 2 of the *Dialogues* of Pope Gregory the Great (c. 540-604), Benedict built two oratories at Monte Cassino, one dedicated to Saint Martin and the other to Saint John the Baptist, on the site of a temple dedicated to Apollo.

After the destruction of Monte Cassino by the Lombards c. 580, the monks fled to Rome, where they were attached to the Lateran basilica. They remained there until c. 717, when Abbot Petronax of Brescia (d. 750) rebuilt the monastery at Monte Cassino with the support of Pope Gregory III and others. Because the monastery at Monte Cassino was thought to maintain the purest observance of the Benedictine way of life, monks in search of inspiration traveled there, and important royal and noble persons removed to Monte Cassino after their conversions. Willibald of Wessex, a kinsman of Saint Boniface, stayed at Monte Cassino as a monk before becoming bishop of Eichstatt; and Sturmi, the first abbot of Fulda, learned the Benedictine way of life at Monte Cassino. Carloman, brother of Pepin, retired to Monte Cassino after his abdication in 747 and was joined by the former king of the Lombards, Ratchis, a few years later.

Paul the Deacon (c. 720-c. 800) was a monk of Monte Cassino, residing there before and after his service in the court of Charlemagne in the first half of the 780s. After his return to Monte Cassino, Paul wrote his important work *Historia gentis Langobardorum*, the principal source for the Lombard history of the period. Charlemagne visited the monastery in 787, bestowing land and privileges on the abbey. As part

of his program to reform the Frankish church, he would later ask the monks of Monte Cassino to send him their copy of the rule of Benedict, considered an autograph copy from the hand of Benedict himself.

The church dedicated to Saint John the Baptist was rebuilt in the early ninth century by Abbot Gisulf (r. 796–817), who also built a monastery and another church at the foot of the mountain. The Saracens sacked the entire complex in 883, killing the abbot, Bertharius (r. 856–883), and causing the monks to flee once again. The monks then escaped to Teano, where the autograph manuscript of the rule of Benedict was lost in a fire. Later they removed to Capua, returning to Monte Cassino only about 950, under Abbot Alingernus (r. 948–985), a disciple of Odo, abbot of Cluny. The monastery remained under the influence of the princes of Capua for the next seventy years.

Monte Cassino reached the peak of its prosperity in the second half of the eleventh century under abbots Desiderius (r. 1058–1087) and Oderisius (r. 1087–1105), when the church was consecrated and the fame of the *scriptorium* was established. During the reign of Abbot Desiderius, the new buildings, constructed with the help of the Norman Robert Guiscard and the Byzantine emperors Michael VII Ducas and Alexius I Comnenus, were consecrated by Pope Alexander II in 1071. During this same century, two abbots of Monte Cassino attained the papacy: Frederick of Lorraine (abbot, 1055–1158) became Pope Stephen IX (r. 1057–1058), and Desiderius became Pope Victor III (r. 1086–1087). In the twelfth century, John of Gaeta, a monk of the abbey, became Pope Gelasius II (r. 1118–1119). Among the great lights of this golden age of Monte Cassino were the rhetorician and poet Alberic of Monte Cassino (died c. 1105); Alphanus of Salerno (d. 1085) and Constantine the African (died c. 1087), working in medicine; and the historians Amatus of Monte Cassino (d. before 1104), Leo Marsicanus (d. 1115), and Peter the Deacon (died c. 1153).

The twelfth century, however, saw the beginning of a decline that would not be reversed until the early sixteenth century. The Normans and Germans ignored the independence of the monastery; and its territorial possessions, the *terrae Sancti Benedicti*, suffered greatly during the struggles for the possession of southern Italy. During much of the thirteenth century, the abbey and its community were caught between the opposing forces of the emperor and the pope and

underwent siege and sack, banishment and abandonment. Conditions improved with the appointment of Bernard Ayglier (r. 1263-1282) as abbot. Bernard—a monk of Savigny, an abbot of Lerins, and a good friend of Charles of Anjou—restored monastic discipline and the authority of the abbey in the *terrae Sancti Benedicti*. He wrote a treatise entitled *Speculorum monachorum* and a commentary on the rule of Benedict, both attesting to his piety and learning, and should be considered among the great abbots of Monte Cassino.

When Pope John XXIII raised the abbots of Monte Cassino to the rank of bishop, the community endured the distress of absentee superiors (1322–1365). An earthquake destroyed the monastery in 1349; rebuilding was begun through the initiative and help of Pope Urban V (r. 1362-1370), a former abbot of Saint Victor of Marseilles. Urban reserved to himself the title of abbot of Monte Cassino, abolished the episcopal see at Monte Cassino, and directed all Benedictine institutions to contribute to the rebuilding of the abbey. In order to restore life to the monastic community, Urban invited monks from other monasteries to transfer to Monte Cassino.

When Monte Cassino joined the late medieval reform congregation of Santa Giustina of Padua in 1504, it once again attained peace and prosperity. The statutes of the congregation had the merit of leaving no foothold for a commendatory abbot, or indeed for an abbot living apart from the monastic community. Pope Julius II decreed that henceforth the congregation, because the name and dignity of the monastery headed all others, should bear the name Monte Cassino.

Montefeltro Family

The Montefeltro family were Ghibellines of central Italy. In the thirteenth century, they gained an important political position in Romagna, especially in Rimini. Emperor Frederick II made them counts of Urbino in 1226. After the breakdown of imperial power in central and southern Italy, the Montefeltro family concentrated on consolidating their position in Umbria, but all their attempts to reestablish control over Romagna met with strong resistance, especially from the Guef family of Malatesta between the thirteenth and the fifteenth centuries.

Preeminent members of the Montefeltro family include the great Ghibelline leader Guido da Montefeltro (c. 1220–1298), a staunch opponent of Guef interests in Tuscany and Romagna who appears in Dante's *Inferno* (Canto 27); and Federico di Guidantonio (1422–1482), a famous *condottiere* and a patron of the arts, whose celebrated manuscripts are now at the Vatican library (*codices Urbinales*) and whose court was a center of Italian humanism. Pope Sixtus IV made Federico duke of Urbino in 1474. Federico's son Guidobaldo (1472–1508), the last ruling Montefeltro and another patron of the humanists, tried to maintain his position in the difficult years of the French invasion of Italy and the ambitious politics of Cesare Borgia. When Guidobaldo died childless in 1508, the duchy passed to the Delia Rovere family.

Monteriggioni

The impressive medieval fortress town of Monteriggione lies some 10 miles (16 kilometers) northwest of Siena in the Val d'Elsa. In the thirteenth and fourteenth centuries, the fourteen towers on the perimeter of the city walls were much taller than they are today—perhaps twice as high. Indeed, they were so formidable that Dante used them in Canto 31 (40-44) of the *Inferno* as the terms of comparison for the proud giants who stand as mute sentinels around the ninth circle, the pit of hell: ". . . come su la cerchia tonda/Montereccion di torri si corona,/così la proda, che 'l pozzo circonda,/torreggiavan di mezza la persona/li orribili giganti . . ." ("just as on its round wall Monteriggioni is crowned with towers, so the giants with half their bodies showing stand towering over the bank, which runs around the pit").

In 1214, the Sienese began to transform Monteriggioni from a loose collection of rural buildings into a fortified town, a process that continued until 1219, with additional work completed in 1260-1270. Toward the end of the thirteenth century, the town grew in importance and gained the additional prestige of having its own *pieve*, the parish church of Santa Maria, constructed at the center of the urban space. Because of its strategic location near the Via Francigena (the major commercial and pilgrimage route that led from the north to Rome) and at the boundaries of the Sienese and Florentine territories, Monteriggioni was contested by both communes and was the site of various sieges and battles.

Montferrat, Marquisate of

Montferrat is situated in the region of Piedmont in the present-day province of Alessandria. It first achieved definition in the late tenth century and eleventh century, and it emerged to prominence in the twelfth century. With the reorganization of northern Italy under Berengar of Ivrea, and later under Emperor Otto I, a certain count of the Aleramici family was invested with lands in the area of Montferrat, and it was his son, Odo, who founded the Montferrat dynasty. Odo's descendants became the ruling families of the area and were dependent on the German emperors as overlords of local secular and ecclesiastical feudal vassals. Many of them were crusaders. These families developed

interests in the eastern Mediterranean world, especially through Byzantium. One member of the family (Ranier) became a son-in-law of the Byzantine emperor Manuel I and was murdered in subsequent dynastic strife. William V the Old was marquis from 1135 to 1190 and assisted Emperor Frederick I Barbarossa in his war with Milan. His son, William Longsword (d. 1177), followed his father to fight in Palestine, where he married Sibyl, the heiress of the kingdom of Jerusalem. Another son of William V, Conrad (d. 1192), after typical Byzantine betrayals, found his place in the Third Crusade. After the crusade, Conrad became the Latin king of Jerusalem, having married Sibyl's sister Isabella; he fell victim to an assassin's knife. A third son of William V, Boniface I, emerged as the leader of the Frankish knights of the Fourth Crusade. After the Fourth Crusade seized Constantinople in 1204, Boniface was cheated out of the Latin imperial crown by his Venetian allies. In compensation, he took over the city of Thessaloniki and created a Latin regime there; it lasted until his death in 1207. His descendants continued to lay claim to the city after it returned to Byzantine rule. In 1305, with the death of the last male member of the Aleramici family, the principality passed to Iolanda of Montferrat, who had been married to the Byzantine emperor Andronicus II Paleologus in order to resolve the old family claims in the Byzantine world. One of their younger children, Theodore Paleologus (d. 1338), was invested with Montferrat by Emperor Henry VII, becoming the new ruler of the Montferrat principality; his line continued to the mid-sixteenth century. During the fourteenth and fifteenth centuries, Montferrat was caught between the aggressions of Savoy and Milan (Visconti) and was under pressure from Genoa.

Mosaic

Mosaic (Latin *musaicus*, *opus musivum*, or *opus tessallatum*; Italian *mosaico* or *musacio*) is the technique of inlaying small *teserae*—tiles of stone, terra-cotta, glass, or glass paste (*pasta vitrea*)—or into a mortar

bed of lime or gypsum, and applied to walls, ceilings, and pavements. For mural mosaics, the stone or brick surface is generally covered with two or three layers of plaster, with the uppermost layer serving as the setting bed. *Sinopie*, or underdrawings, may appear on the *arricio* (lowest plaster layer) or the setting bed itself to serve as compositional guides to the mosaicist. Usually, tesserae were set into one small patch of plaster at a time, applied, as in the fresco technique, from the top downward.

Pebble mosaic pavements were produced as early as the eighth century B.C. in Asia Minor (e.g., Gordium near modern Ankara, Turkey); but the technique of setting more regularly shaped cubes or tesserae in close rows was not developed until the late third century B.C. in Hellenistic Greece. Mosaic was probably first introduced to the Italian peninsula in the late second century B.C. and was used, for the most part, in pavements, but also occasionally in niches in gardens, such as those found in Pompeii. Glass and *pasta vitrea* tesserae, which are the most common material for medieval mural mosaics, are found in Italy as early as the first century after Christ. Although mosaic continued to be used for pavements up to the thirteenth century, the most innovative and sophisticated production in medieval Italy is associated with interior decoration and, occasionally, exterior facades of churches, private mausoleums, and chapels. In these contexts, mosaic was used as a more luxurious alternative for fresco decoration, fulfilling broader didactic, narrative, and devotional functions. Because of the high cost of production, and the frequent need to import materials and craftsmen from the Byzantine empire, mosaic also tends to be associated with major centers of political power—especially Rome, Ravenna, Palermo, and Venice—and it brings with it certain ideological associations related to ecclesiastical and princely patronage.

Mosaic Pavements

The chronological survey that follows will focus on the history of mural mosaics associated with the major centers of production: Rome, Ravenna, Norman Sicily, Venice, and Florence. It should be noted, however, that pavements continued to be a vital part of mosaic

production. Among the first and most impressive early Christian mosaics are the pavements in the double cathedral complex of Aquileia, made during the reign of Constantine under Bishop Theodore (c. 314-318). In the south church, the mosaics represent biblical types of salvation and resurrection, comparable to those found in the Roman catacombs, including the the story of Jonah and the whale (in the sanctuary) and the Good Shepherd. Both the south church and the parallel church to the north also contain portraits or inscriptions of donors and a multitude of animals and birds. With their combination of stone and glass tesserae and their varied palette and iconography, the Aquileia mosaics are distinguished from the vast majority of pavements produced during the fourth to sixth centuries. Much more common, especially from the fifth and sixth centuries, are pavements such as those found in the nearby cathedral of Grado (579), in which geometric and foliate motifs, as well as donors' inscriptions, dominate the design, while the palette is limited to a few colors in stone.

Between the later sixth century and the eleventh century, there is little evidence of true mosaic pavements in Italy. The medium flourished again from the second half of the eleventh century to the early decades of the thirteenth century, but none executed with a more limited palette, and often in monochrome. Thematically, these later pavements focus on cosmological and allegorical themes. A particularly well-preserved ensemble is found at San Savino in Piacenza (c. 1160-1170). The crypt pavement features a cycle of the *Labors of the Months* and zodiac symbols set against the sea. In the sanctuary above, a more complex allegory represents the personification of the year, *Annus*, at the center of fortune's wheel, flanked by conflicting behavioral examples, including armed combat and dice as images of chance, and law and chess as models of reason and skill. Similar allegories and calendar cycles are found elsewhere in northern Italy at San Michele in Pavia, San Salvatore in Turin (1105), and the cathedral of Aosta (1110).

An exceptionally rich iconographic program is found in southern Italy at the cathedral of Otranto (1163-1166). The pavement of the nave is conceived as a vast tree whose branches are filled with a wide range of themes, including the conventional labors and zodiac symbols and the biblical narrative of Noah's ark, as well as ostensibly secular themes

of hunting, armed combat, Arthurian romance, and the ascension of Alexander. The choir mosaic includes rondels filled with mythical and fantastic beasts such as centaurs and sirens, in addition to biblical narratives of the creation and fall, and of Cain and Abel.

True mosaic seems to have been eclipsed as the medium of choice for pavements in Rome and southern Italy by a revival of *opus sectile* pavements, beginning with the rebuilding of Monte Cassino (consecrated in 1071). The new fashion of laying out pavements called for a series of larger rectangular slabs of marble surrounded by frames set with multicolored stones and the establishment of cruciform or axial pathways formed of large disks of porphyry or *verde antico* to choreograph liturgical action within the church. This technique, ultimately inspired by Byzantine designs, was perfected by the workshops of the Cosmati in Rome; making use of extensive supplies of spolia from imperial monuments came to be standard in all the major Roman basilicas during the twelfth and thirteenth centuries (e.g., San Clemente, Santa Maria in Cosmedin, Santa Maria Maggiore, and Santi Quattro Coronati). It was also applied in combination with mosaic tesserae to liturgical furniture, including the *schola cantorum* or chancel, pulpits, and paschal candlesticks (e.g., San Clemente and San Lorenzo Fuori le Mura in Rome, the cathedrals in Salerno and Ravello, and the Cappella Palatina in Palermo). Further north, in the Veneto,

opus sectile was often combined with smaller sections of mosaic tesserae (e.g., San Marco and San Zaccharia in Venice and the cathedral in Murano).

Between the early fourth century, when Christianity gained official status in the Roman empire as a result of Constantine's Edict of Milan (313), and the revival of the Roman empire in the west under the Frankish King Charlemagne (r. 768-814), mosaic production flourished continuously in two metropolitan centers of power: Rome, which was the old imperial capital and the new ecclesiastical center; and its temporary successor as the western capital, Ravenna. Outside these two centers, mosaic production is certainly present, but only very fragmentary information emerges. From Milan, which served as temporary capital from 395 to 405, only two examples of Christian mosaics survive—those adorning the oratory of San Vittore in Cielo d'Oro at Sant'Ambroggio, representing portrait images of the titular saint and other Milanese saints; and fragments of a larger cycle in the chapel of Sant' Aquilino at San Lorenzo Maggiore. To the south of Rome, Naples preserves a single example of mosaic decoration in the cathedral baptistery.

The first phase of medieval mosaic production in Italy coincides with the rise of Christianity as a more visible, officially sponsored religion within the Roman empire, and with the gradual weakening of Rome's status as the political capital of the old empire. The earliest known mosaics with Christian subjects are those from the late third century representing Jonah, the Good Shepherd, and Christ as the sun decorating the walls and vault of the mausoleum of the Julii beneath old Saint Peter's in Rome. The last of these subjects, set within a grapevine against a gold ground, represents a syncretist approach common in the earliest Christian art.

Although there is scant evidence of figural mosaics commissioned at the time of Constantine in his first major church buildings, the *Liber pontificalis* does record that the semidome of the apse in the Lateran cathedral, begun in 312-313, "shimmered in gold" mosaic. It has often been assumed that the present apse mosaic in the Lateran, a nineteenth-century reconstruction of the thirteenth-century apse mosaic by Jacopo Torriti, at least copies a Constantinian mosaic depicting the floating head of a bearded Christ. Medieval legend associates this head with a miraculous vision of Christ at the time of the consecration of the new cathedral in 312-313, and in the thirteenth century mosaic an inscription records the reuse of the original as if it were an independent

icon.

A synthesis of Christian and pagan is found in the figural mosaics decorating the mausoleum associated with Constantine's daughter Constantina, attached to the funerary basilica of Sant'Agnese Fuorile Mura, now known as Santa Costanza. The circular-plan domed structure was adorned with an elaborate program of mosaics combining traditional pagan imagery of the grape harvest, funerary portraits, and an inhabited vine scroll in the vaults of the ambulatory with conventional biblical types of salvation in the drum of the cupola (including Daniel in the lion's den and Susannah and the elders). The mosaics of the ambulatory, though heavily restored, survive in good condition, but those of the cupola were destroyed in 1620 and are known from earlier watercolors and drawings by Francisco de Hollanda and P. Ugonio.

Not until c. 400 does mosaic decoration become the norm in Christian churches, largely under the sponsorship of the bishops of Rome. At a time when the western Roman empire was politically weakened by invasions from Germanic tribes, mosaics commissioned by the bishops of Rome proclaimed the new prestige of the Christian church under their leadership. In churches of the standard basilican design, with a single apse at the sanctuary, it became standard to represent a theophany of Christ based on the book of Revelation in the apse, and narratives from the Old and New Testaments on the nave walls above the colonnades. The first extant apse mosaic is found at the basilica of Santa Pudenziana on the Esquiline Hill, usually dated to c. 405-406. Here Christ appears enthroned between his apostles within the cityscape of Jerusalem. Immediately behind him rises the *crux gemmata* on Mount Calvary flanked by the four living creatures of the apocalypse (Revelation 4:2). Christ is thus presented both as human teacher, a model for the bishop who would have been enthroned below at the base of the apse, and as deity. A distinctly Roman ecclesiology is emphasized here by the elevation of Peter and Paul to the primary positions flanking Christ. Although Paul was not one of the twelve disciples, he appears opposite Peter (apostle to the Jews) as apostle to the gentiles and cofounder of the Roman church. It was on the basis of their alleged joint mission to Rome, and their martyrdom and burial there, that the bishops of Rome, starting with Pope Damasus I (r.

366-384), claimed primacy in the affairs of the Christian church. Peter and Paul came to be viewed as Roman apostles, the new Romulus and Remus of the Christian capital. Stylistically, the mosaic evokes a Roman classicism befitting the newfound temporal authority of the bishop of Rome at a time when the imperial administration had left Rome in favor of Milan (395-402) and later Ravenna (402-476). In contrast to the fourth-century frescoes of the Christian catacombs, the figures here are modeled volumetrically and set within an illusionistic foreground space, and the architecture of the cityscape is modeled on the atria and public monuments of imperial Rome. A comparable theme is suggested in the mosaics on the west wall of Santa Sabina, commissioned under Pope Celestine I (r. 422-432); here, two female personifications flank the dedicatory inscription to embody the two peoples united in the Christian church under the rule of the bishop of Rome: *Ecclesia Ex Circumcisione* (the Jews) and *Ecclesia ex gentibus* (the gentiles).

Just before the mid-fifth century, Pope Sixtus III (r. 432-440) commissioned the most extensive extant narrative program of mosaics from the early Middle Ages in the basilica of Santa Maria Maggiore. The nave cycle originally presented more than eighty episodes from the Old Testament in forty-two panels (of which twenty-seven survive), placed within elegant gabled aediculae immediately above the frieze of the colonnade. The studied classicism of the architectural framing is carried over into the style of the mosaics. Well-modeled figures are set within a bright landscape, impressionistically rendered to convey a limited sense of space. Great battles scenes and details of armor in the Joshua cycle, in particular, reinforce the impression that Joshua is a Roman emperor or general on campaign; they are set within an epic narrative comparable to those of the triumphal columns of Marcus Aurelius and Trajan and in illuminated manuscripts such as the Vatican Virgil. The mosaics of the triumphal arch are closely related, but somewhat coarser in style. Executed on a larger scale, they seem to have been designed to take into account the long-distance view from the end of the nave. They are also easier to "read" from a distance because of the predominantly gold ground.

In contrast to the nearly contemporary fresco cycles in the naves of old Saint Peter's and Saint Paul's in Rome, the narrative begins not with the creation of the world but rather with a covenant established with

the patriarch Abraham (the *Offering of Melchizedek to Abraham*). Brenk (1975) has shown that the principal theme of the narrative, which extends through the careers of Isaac, Jacob, Moses, and Joshua, is the passing of Abraham's covenant and blessing to the younger son of his descendants, culminating with the entry into the promised land under Joshua. Christianity is depicted, in turn, as the "younger son" and successor to Judaism on the triumphal arch, the visual climax of the basilica. Here, Mary's role as *theotokos*, or mother of God (recently proclaimed at the Council of Ephesus, as well as in the dedication of Santa Maria Maggiore) is apparently emphasized. Christ's infancy is narrated in seven episodes, ranging from the *Annunciation* to the *Adoration of the Magi* and an enigmatic, probably apocryphal episode usually described as Christ met by Aphrodisius in Egypt. Spain (1979) proposes, by contrast, that Old and New Testament figures are intermingled on the arch to suggest the fulfillment of the promised blessing to Abraham. She re-identifies the Annunciation scenes in the upper tier as relating to Abraham and Sarah; and the enigmatic "Aphrodisius" scene is interpreted as David greeting the Christ child—an unprecedented narrative combining the two testaments in one image. A specifically Roman gloss to the program as a whole is proclaimed at the apex of the triumphal arch, where the Roman apostles Peter and Paul flank the *Etimasia* (the empty throne prepared for the Messiah) as representatives of the assembly of Jews and Gentiles under the leadership of the bishop of Rome.

The last mosaic to adhere to the tradition of late antique illusionism in Rome is the mosaic inserted into the apse to consecrate an elegant Roman temple in the forum as the Church of Saints Cosmas and Damian, (Santi Cosma e Damiano, dedicated by Pope Felix IV, r. 526-530). Here, in contrast to the terrestrial setting of the composition in Santa Pudenziana, Christ appears standing amid clouds at his second coming, flanked by Peter and Paul, who present to him the physician saints Cosmas and Damian, as well as the pope and Saint Theodore. A lower frieze of lambs—the first extant example of a common theme in Rome—converges at the *Agnus Dei* in reference both to the eucharistic sacrifice, and to the apocalyptic vision of the lamb. Stylistically, the figures are monumental, their bodies solid and their limbs well-articulated beneath heavy draperies. Relatively small tesserae are set in

tight rows, and flesh areas fashioned using glass tesserae are strongly modeled in chiaroscuro with bright coloristic highlights.

Later in the sixth century, perhaps under the impact of the Byzantine conquest of Rome in 536–545, the style of mosaics in the city was dramatically transformed from the sculptural to the abstract. Four churches have iconic portraits of saints that highlight the presence of relics, fulfilling the essential function of funerary portraits originating in the catacombs: the triumphal arch of San Lorenzo, commissioned by Pope Pelagius (r. 579–590); and the apse mosaics of Sant'Agnese Fuori le Mura commissioned by Pope Honorius I (r. 625–638), Santo Stefano Rotondo commissioned by Pope Theodore (r. 642–649), and the chapel of San Venanzio (attached to the Lateran baptistery) commissioned by Pope John IV (r. 640–642). In all these mosaics, almost immobile figures of saints stand isolated from one another against a stark gold ground. They seem not so much to stand within the landscape as to float or hover over it, their feet pointed downward on the diagonal, set against abstract color fields—symbolizing, rather than describing, the landscape of paradise. Bodies are flattened by draperies, and faces are dematerialized by much looser disposition of tesserae and by large staring eyes. It is as if the form of these portraits is intended to diminish the saints' apparent corporeality in favor of the ethereal existence of their souls, already thought to reside in heaven.

From the eighth century, a single mosaic scheme is known from existing fragments and later documentation: the oratory of Pope John "VII" (r. 705–707) in old Saint Peter's. Designed to hallow the pope's tomb, this chapel is an early example of a private burial space created within the walls of a preexisting church. The program focused on an iconic image of *Maria Regina* with hands outstretched in the orant gesture (now in San Marco, Florence), and on the pope himself as donor and self-described "servant of the mother of God" standing at her feet. The narrative, arranged in three zones around the Marian icon, recounted the infancy and passion of Christ, culminating in the new Byzantine image of the *Anastasis*—Christ's descent into hell to raise the dead—an appropriate plea for the pope's own resurrection.

Early medieval mosaic production in Rome reached its zenith during the Carolingian Renaissance—a period of vital artistic activity that coincided with the Franks' conquest and occupation of Italy under

Charlemagne and his son Louis the Pious. The first and most distinctive mosaic decoration, that of the *triclinium*, or banquet hall, in the old Lateran Palace, contains the only explicitly political message: the renewal of an "Augustan peace" in a Christianized empire in which church and state are in harmony. Known from seventeenth-century engravings, as well as from the present heavily restored mosaic transferred to a new location adjacent to the Scala Santa (1743), the *triclinium* apse mosaic depicts Christ commissioning his apostles; in the spandrels of the triumphal arch, Christ himself bestows authority on kneeling figures of Pope Sylvester (or Saint Peter) and the first Christian emperor, Constantine; and at right, Peter, vested as the first pope, bestows authority on Charlemagne as a "new Constantine" and on Pope Leo III, who crowned Charlemagne emperor.

The first of the four Carolingian sanctuary mosaics, though more conventional in iconography, is unusual in its selection of themes. In the mosaics of Santi Nereo ed Achilleo, commissioned by Pope Leo III (r. 795-816), the standard image of a triumphal arch drawn from Revelation 4 is replaced by three narratives: the *Annunciation*, the *Transfiguration* (at center), and a rare scene of the Madonna and child acclaimed by an angel. More standard religious iconography, mainly reviving early Christian types, appears in the other four mosaic programs of this period.

The conches of Santa Cecilia in Trastevere and Santa Prassede, both commissioned by Pope Paschal I (r. 817–824), and that of San Marco, commissioned by Pope Gregory IV (r. 828–848), follow the model of Santi Cosma e Damiano in depicting Christ at the second coming, flanked by Peter and Paul, who present Roman martyrs and the donor pope holding a model of the church. The fourth apse mosaic at Santa Maria in Dominica, also commissioned by Paschal I, depicts another early Christian iconographic type, the Madonna and child enthroned receiving homage from apostles and saints holding crowns; the same theme appears in the sixth-century mosaics at Sant'Apollinare in Classe in Ravenna.

The most innovative of the four mosaic programs is that of Santa Prassede. The outer triumphal arch depicts the rare theme of angels guiding processions of the saints into the walls of the heavenly Jerusalem. The mosaic seems to refer to a claim by Pope Paschal I that

he translated the relics of 2,300 martyrs within the city walls of Rome to be deposited in the church of Santa Prassede. Another novelty here is the introduction of a customized mosaic program for the burial chapel of the pope's mother, Theodora Episcopa. The upper parts of the vault present Christ Pantocrator and processions of saints into the heavenly paradise; at a lower level, Theodora herself is portrayed above her tomb in the company of the local patron saints and the Madonna and child. As in John VII's chapel, the Byzantine *Anastasis* image appears above her burial as a promise of salvation.

For the first time, one can speak of a relatively homogeneous style of mosaic production in the six monuments decorated during this period of political stability. Although the figures have some of the flattened features of their seventh-century counterparts, they are now more agile in their movements, and their proportions are more elongated. Draperies are modeled in a sparse linear fashion with double parallel lines—a distinctive device which Davis-Weyer (1966) connects to Byzantine manuscript illumination (e.g., the *Sacra Parallella*). Faces, though more elongated and oval than their fifth-century counterparts, do appear to revive the impressionistic handling of the mosaics, such as those at Santa Maria Maggiore: tesserae are arranged in relatively loose rows, and bright orange and blue are used to represent highlights and shadows.

The political and ecclesiastical stability that fostered the efflorescence of mosaic production in Rome from Leo III to Gregory IV came to an end with the decline and breakup of the Carolingian house in the 840s. No longer sustained by a strong imperial supporter, the papacy was left in the hands of local clans, and Rome itself was increasingly vulnerable to external threats. Conditions were not ripe for another sustained period of mosaic production in Rome and southern Italy until the late eleventh century.

Ravenna between the Fifth and Seventh Centuries

Ravenna, the second great center for mosaic production in early medieval Italy, rose to prominence first as the capital of the western Roman empire between 402 and 476, later as the capital of the

Ostrogothic kingdom, and finally as the seat of the Byzantine exarch. The earliest wall mosaics in Ravenna decorate a cruciform mausoleum attached to the monastery of Santa Croce (c. 430–450), generally known as the Mausoleum of Galla Placidia. In this intimate structure we see an early example of a hierarchical program of images designed to reinforce the funerary function of the space. The vaulting over the crossing presents the apocalyptic vision of the cross—the "sign of the son of man" (Matthew 24)—adored by the four living creatures and heralded from below by eight apostles. Over the entrance to the mausoleum, the Good Shepherd appears in a bucolic landscape as an allegory for entrance into the heavenly paradise. The intercession of the martyrs is evoked in the mosaic on the opposite lunette, showing either Lawrence or Vincent of Saragossa (Mackie 1990) holding a cross-staff and standing triumphantly adjacent to the fiery gridiron of his martyrdom. Finally, the rich foliate ornament on intradoses and barrel vaults of the arcosolia evokes the organic metaphor for resurrection and regeneration.

A second mosaic program that reinforces the function of the space it decorates was commissioned in 458 by Bishop Neon for the cathedral baptistery. The vault over the font is given over to a grand ceremonial composition focusing on a fictive oculus in which is depicted the baptism of Christ—the historical model for the ritual of Christian initiation. In the next of two concentric zones, two processions of the twelve apostles, led by Peter and Paul, converge immediately beneath Christ. Inhabiting a paradisiacal landscape, they hold diadems as symbols of the heavenly rewards offered to all those who have been baptized. In the lower zone, the *Etimasia* is represented four times in alternation with gospel books displayed on altars. Set within illusionistic colonnades with coffered soffits, these elegant garden spaces still belong essentially to the tradition of Greco-Roman illusionism represented in the frescoes of Pompeii

Within fifty years, the style of mosaics in Italy would be dramatically transformed by the impact of Byzantium. Roman rule in Ravenna was ended when the Germanic leader Odoacer (Odovacar) conquered the city in 476. Odoacer succumbed in turn to King Theodoric of the Ostrogoths in 493. Though nominally a "barbarian," Theodoric had been raised as a privileged hostage in the imperial palace at Constantinople,

where he acquired a taste for both ancient and contemporary Byzantine culture. When he established a new cathedral and baptistery for his own Arian faith, Theodoric had the composition of the earlier baptistery mosaics adapted to this new context. The dome composition again focuses on a fictive oculus with the baptism of Christ in the center and a procession of apostles bearing crowns in the surrounding zone. Now, however, the subtle architectural constructions of the lower zone are omitted and the apostles are set against a solid gold ground, giving them a greater monumentality. At the same time, the ground line on which they are standing has been flattened, and the draperies appear somewhat metallic in execution.

For his palace chapel, Sant'Apollinare Nuovo (c. 500), Theocloric commissioned an ambitious program of mosaics comprising three components: in the lowest zone, immediately above the colonnades, two parallel processions of female and male martyrs proceeding respectively from the port of Classe and the palace of Theodoric to a Madonna and child enthroned and an adult Christ enthroned at the apse end; standing figures of apostles and prophets between the windows of the clerestory; and finally, in the uppermost zones, small rectangular panels depicting episodes from Christ's ministry on the left wall, and from the passion on the right. Of particular interest is the way in which the decoration reinforces liturgical themes: for example, the *Last Supper* is positioned adjacent to the sanctuary to emphasize the historical institution of the eucharist celebrated there, and the processions themselves seem to offer a parallel for the offertory procession down the central nave to the altar. Such elements would seem to originate in the Byzantine east. The lower frieze of processional figures was reworked shortly after the Byzantine conquest of Ravenna in 540; at the same time, figures of Theodoric and his court were obliterated from the intercolumniations of the palace mosaic, leaving stray hands and shadows in the gold background. In these Byzantine additions, the process of dematerialization is further emphasized: figures are flattened by a proliferation of gold in garments and by the omission of halftones, and they no longer give any pretense of standing within a shallow illusionistic space.

Although the architecture of San Vitale was begun under Ostrogothic rule during the episcopate of Ecclesius, the celebrated mosaics in the

presbytery were probably produced entirely after the Byzantine emperor Justinian's forces conquered Ravenna and much of the Italian peninsula in 540, and they were completed sometime between 546 and 548. The sophisticated iconographic program is essentially western in spirit. The apse is occupied by a theophany in which angels present the titular martyr and the founding bishop and donor Ecclesius before Christ. The vault represents a vision of the lamb of God supported by angels. As Deichmann (1969-1989) has shown, the side walls present in a vertical sequence a summary of the three eras of sacred history. The first, *ante legem* (before the law), includes the lunette panels depicting the offerings of Abel and Melchizedek at right, Abraham entertaining the angels, and the sacrifice of Isaac. The subjects of these lunette panels, mentioned *in the* canon of the Roman mass, also serve as types for the eucharistic sacrifice and thus reinforce the function of the space below.

The second era, *sub lege* (under the law), is represented in the spandrels of the lower level by Moses receiving the ten commandments and beholding the vision of the burning bush. The figures of the four evangelists flanking the openings into the gallery on the upper level collectively embody, with the lamb of God in the vault, the era *sub gratia* (under grace) from the incarnation to the second coming of Christ. A political accent is given to the program by the celebrated portrait panels on either side of the apse windows depicting Justinian and Theodora with their retinues in procession. Although Justinian and Theodora never set foot in Ravenna, their presence is insinuated by these proxy portraits, and their beneficence as donors seems to be recorded in the ostentatious display of liturgical silver that both of them carry—Justinian, the patten; and Theodora, the chalice.

It is also generally accepted that the prominent portrayal of Archbishop Maximian—the only figure to be labeled in the portrait panels—immediately next to Justinian was designed to strengthen his position as imperial appointee. Since the head of Maximian appears to have been altered and the inscription added after the original portraits were made, Andreescu-Treadgold and Treadgold (1997) have plausibly argued that Maximian's predecessor Victor was originally represented with Justinian, and the substitution was made only after Maximian was imposed on Ravenna in 547. These scholars believe that among those

accompanying Justinian and Theodora, it was not so much the bishop as the lay aristocrats—whom they identify as General Belisarius and his wife Antonina—who needed to assert their legitimacy by association with the emperor.

Stylistically, the mosaics represent a synthesis of traditional Greco-Roman pictorial illusionism in the representation of figures and landscape with a new abstraction in the representation of space. While individual figures are illusionistically modeled and framed within scenic landscapes, the spatial distinction between frame and framed has been blurred; figures seem less to inhabit the landscape than to be set against a landscape backdrop, placed close to the picture plane. Spatial ambiguity is particularly pronounced in the Justinian panel, where all the figures in a procession, moving to the right, are presented with the same frontality and dangling feet, and the emperor is given due prominence by overlapping figures who should be in front of him—and by his position on the central axis. A similar programmatic manipulation of spacial relations is seen in the panels of offering scenes: table and altar are represented as if in an aerial view with parallel edges placed on orthogonals that converge ideally in the space of the real altar below: the actual priest and his altar are thus united pictorially with the just offerers of the Old Testament.

A second mosaic program was completed in 549 under Maximian in the apse of Sant'Apollinare in Classe, the port of Ravenna. Ecclesiastical politics were once again a primary motivation for the iconographic scheme. The focal point of the conch is Saint Apollinaris, said to have been a disciple of Peter and the founding bishop of Ravenna, whose relics were transferred from the adjacent cemetery to a place beneath the high altar of the new church. Apollinaris stands in a verdant landscape of paradise beneath a symbolic composition of the Transfiguration. Christ is represented in a medallion bust at the center of a jeweled cross. After the defeat of the Arian Goths, this iconographic shift may have served to stress the Orthodox view that Christ was at once fully human and fully divine in his terrestrial life. Apollinaris appears not only as a defender of orthodoxy, but also as head of the apostolic succession. His "flock" appears in the form of twelve sheep proceeding toward him from either side, and at the base of the apse stand five of his successor bishops from the fifth and sixth

centuries, who represent the institutional church over time and strengthen the legitimacy of Maximian's claim to metropolitan authority in the regional church. More than a century later, such ecclesiastical claims were reinforced by a narrative panel added to the left side of the base of the apse by Bishop Reparatus (r. 673-679). Here the claim of Ravenna to be an autocephalous church is affirmed at left by a mosaic modeled on the Justinian panel at San Vitale, showing Reparatus with his sponsor, the Byzantine emperor Constantine IV (r. 668-685). At the same time, two more mosaics were added: the corresponding panel on the opposite side of the apse, representing Abel and Melchizedek as models for the eucharistic offering; and the triumphal arch mosaic showing the vision of Christ amid the four evangelists and processions of sheep from the cities of Bethlehem and Jerusalem.

These mosaics, which lack the sophisticated spatial manipulation seen at San Vitale, mark the end of a golden age of mosaic production in Ravenna. Ravenna was politically eclipsed by Venice in the eighth century and would not commission another major mosaic program until the twelfth century, when it had to call on a workshop based in Venice.

Monte Cassino, Rome, Southern Italy, and the Revival of Mosaic in the Late Eleventh and Twelfth Centuries

The art of mural mosaics in Italy was virtually extinguished between the mid-ninth century and the late eleventh century. In his *Chronicle of Monte Cassino* (1071), Leo of Ostia writes that the arts of mural mosaic and *opus sectile* pavements, which had not been practiced by Latin masters (*magistra latinitas*) for centuries, were revived under Abbot Desiderius (r. 1058–1087), who called on Byzantine artists from Constantinople to decorate the new abbey church of Monte Cassino. According to Kitzinger (1972) and Toubert (1970), Desiderius, who was closely associated with the reform movement of Pope Gregory VII, the former Abbot Hildebrand of Monte Cassino, deliberately revived the medium, as well as the iconography of early Christian church decoration, to visually embody the return to the *ecclesia primitiva* and what was considered the golden age of the papacy. Although the

eleventh-century abbey no longer survives, Leo informs us in general terms of its decoration, which included mosaic on the triumphal arch and apse and probably mosaics of the Old and New Testaments in the atrium. As Kitzinger has shown, the style and revivalist iconography of these mosaics can be glimpsed in the fragmentary decoration of the triumphal arch at the cathedral of Salerno, completed c. 1085 under Desiderius's close colleague Archbishop Alfano. Iconographically, a bust-length bearded Christ, flanked by half-length figures of the four evangelists recalls early Christian schemes found in Rome (e.g., at San Paolo Fuori le Mura), while the stylized vegetal ornament in the borders evokes examples found in the Lateran baptistery. Stylistically, a new wave of Hellenism from the Byzantine east seems to be reflected in the strong chiaroscuro modeling of the flesh of the angel and in the clinging folds of his drapery.

Sant'Apollinare in Classe, Ravenna. Apse mosaic with Apollinaris beneath a symbolic *Transfiguration of Christ*, c. 540-549. Photo courtesy of Thomas E. A. Dale.

The same combination of Byzantine style and Roman revivalist ornament and iconography is adapted in Rome within a more innovative ecclesiological iconography in the early twelfth-century apse mosaics of San Clemente (c. 1119-1125) and Santa Maria in Trastevere (1143). In San Clemente, the familiar vision of *Christ with the Four*

Living Creatures—almost identical in style and iconography to the Salerno mosaic—reappears in the upper zone of the triumphal arch. In the lower spandrels, however, the Roman saints appear in a new triumphant guise: Lawrence, seated with Paul at left, tramples the gridiron underfoot; and Clement, seated at right with Peter, holds the anchor and treads on the ship associated with his martyrdom in the Black Sea. The reformers' interest in typological interpretation is reinforced in the lowest zone of the arch by Isaiah and Jeremiah, who hold scrolls with prophecies of the messiah. The conch represents, as the inscription indicates, an allegory of the church as a vine, which is caused to flourish by the cross but is potentially desiccated by the "law"—usually interpreted as Mosaic law, in contrast to Pauline grace or, taking into account the church's conflict with imperial authority, secular law (see Matthiae 1967, 1:283-286). A Byzantine crucifixion scene of the relatively new "dead Christ" type marks the central axis, and from its base stems a luxuriant vine scroll. The vine is an apt symbol of ecclesiastical renewal promoted by the reformers, and its form is one of a series of explicit references to celebrated early Christian monuments of Rome—in this case, the *triclinium* of the Lateran baptistery. The renewal of the *ecclesia primitiva* is reinforced by other early Christian images, including the stags drinking from the four streams at the base of the cross, the shepherds tending their flocks, and the lower frieze of sheep proceeding from the cities of Bethlehem and Jerusalem, representing the union of Jews and gentiles in the Roman church.

The apse mosaic of Santa Maria in Trastevere reveals a similar combination of antiquarianism and innovation. The early Christian iconography of the *Maiestas domini* is repeated again in the upper zone of the triumphal arch, and, following the lead of San Clemente, Old Testament prophets appear in the lower spandrels. Other early Christian motifs include the lower frieze of lambs and the shell motif at the apex of the conch; a veneer of more patently pagan antiquity is lent to the decoration by the inclusion of half-naked putti holding drapery filled with fruit. The figures of Christ and the crowned Virgin Mary enthroned together on the central axis constitute one of the earliest representations of the coronation of the Virgin; yet, as Kitzinger (1980) was the first to recognize, the figure types of both are based on the most

venerable icons of early Christian Rome that were used in the public procession of Assumption day. The royal attributes of Mary evoke the eighth-century Marian icon of Trastevere itself, but also suggest a triumphant image of a newly emboldened *Ecclesia* under the strong rule of Pope Innocent II. Innocent II himself appears as donor in the company of a line of early Christian predecessors starting with Peter, who embody the origins of ecclesiastical authority in Rome.

San Clemente, Rome. Apse mosaic showing *Crucifixion* and vine as allegory of the church, c. 1119-1125. Photo courtesy of Thomas E. A. Dale.

The apses of Santa Maria in Trastevere and San Clemente are only two of the best-preserved examples of extensive, nearly continuous mosaic production in Rome between 1100 and the early thirteenth century. Other examples include the apse in Santa Maria Nova in the Roman forum (1160s), which depicts an enthroned Virgin and child flanked by apostles; the facade of San Bartolomeo all'Isola, of which only a bust of Christ remains; the destroyed apse and triumphal arch of old Saint Peter's, featuring the early Christian *Traditio legis* flanked by Pope Innocent III (r. 1198–1216) and *Ecclesia Romana*; the apse mosaic of San Paolo Fuori le Mura (c. 1218–1226), showing the enthroned Pantocrator between apostles; and, finally, the mosaic (since destroyed) installed by Pope Gregory IX (r. 1227-1241) on the exterior facade of old Saint Peter's showing Christ enthroned between Peter and Paul, the

four evangelists, and (in the lower zone) the twenty-four elders. The San Paolo mosaic, though completely remade after fire destroyed most of the church in 1823, is of particular interest because Pope Honorius II is documented as having written to the doge of Venice to request mosaicists to work on the project. This indicates that mosaic production in Rome was waning by that time and had been eclipsed by production in Venice, which had developed the art of mosaic under the tutelage of Byzantine craftsmen from the eleventh century on.

Norman Sicily in the Twelfth Century

However much Roman mosaicists may have benefited from the arrival of craftsmen from Byzantium at Monte Cassino in the late eleventh century, their production remained essentially Roman, for they were quite deliberately drawing on a rich tradition represented in the city's early Christian and medieval churches. The twelfth-century mosaics of Norman Sicily, by contrast, were produced *ex novo* and relied entirely on the technical expertise and formal repertoire of mosaicists imported from Byzantium—they are essentially Byzantine mosaics on western soil. The Norman kings—who were themselves foreigners in Sicily, having conquered the territory from the Muslim rulers in the late eleventh century—seem to have appropriated Byzantine mosaic decoration in their churches as a kind of artistic koine of sacred authority for their rule. Four surviving churches, all connected with court patronage, were decorated with mosaics by Byzantine artisans in the course of the twelfth century: the Palatine Chapel (Cappella Palatina) in Palermo (sanctuary, 1142-1148; nave, 1154—c. 1166), the Martorana in Palermo (church of Saint Mary of the Admiral, 1142-1143); and the cathedral in Cefalù (1148) and Monreale. Examples of secular mosaic decoration are found in the so-called *stanza di Ruggero* of the royal palace in Palermo, as well as in the Torre Pisana and the Zisa. The first three churches were decorated primarily during the reign of Roger II; the last example was decorated under William II. Stylistically, they represent two broader phases of contemporaneous Byzantine artistic production during the Comnenian dynasty: the early Comnenian and late Comnenian "baroque" styles. Kitzing (1960) has demonstrated

that the Old Testament mosaics in the nave (throne room) of the Cappella Palatina in Palermo and the nave of Monreale Cathedral make use of the same designs for single figures and entire compositions, perhaps drawing on standard model books in the workshop, but the figure style was dramatically transformed at Mon reale. The clinging draperies that calmly model the figures of Palermo are transformed into windblown garments, expressing the movement of more energetic, more emotional figures. The modeling of faces and cloth is also transformed by an exaggerated contrast of light and shadow.

The ideological rationale for using Byzantine mosaicists and primarily Byzantine iconography is most clearly demonstrated in the first two churches decorated under Roger II. In the Martorana, a Byzantine-style central-plan domed church built by George of Antioch, Roger is represented in a donor panel as if he were a Byzantine emperor, dressed in a gold-embroidered imperial *loros* and crowned by Christ; the accompanying inscription transliterates his Latin title (*Rogerus Rex*) into Greek characters. The rest of the mosaic decoration, focused on the Pantocra tor in the central dome, is otherwise a quite faithful adaptation of the middle Byzantine scheme of mosaic decoration.

A more complex adaptation of Byzantine iconographic schemes is found in the mosaics commissioned by Roger II for the Cappella Palatina in Palermo (1143-1148). The program of the east end of the chapel adapts the "classical system" of middle Byzantine mosaic decoration to a rather narrow barrel-vaulted transept with a central dome supported on squinches, taking into account the ideal viewpoint of the king himself in an upper-level balcony at the north end of the transept (Kitzinger 1960). The Byzantine Pantocrator, surrounded by archangels, dominates the program from the apex of the dome. Two theophanies—the *Ascension of Christ* and the *Pentecost*—usually reserved for domes, are here adapted to the barrel vaults on either side, with Christ represented at the top of the vault in each case. The rest of the feast cycle, ranging from the *Nativity* to the *Entry into Jerusalem*, is focused primarily on the south wall of the transept opposite the royal balcony. In this way the king faced directly the scenes that most identified him with the sacrosanct rule of Christ, especially in the enlarged scene of the triumphal entry into Jerusalem. Similarly, the

program of single saints is oriented to the royal viewpoint. For example, the *Hodegetria*—a traditional intercessory image for the Byzantine emperor—appears on the east wall of the north transept, slightly off-center so that it can easily be seen from the adjacent royal balcony.

The program of mosaics in the "nave" represents, by contrast, a much more Italian scheme of decoration: an Old Testament narrative over the nave arcades, and cycles of the lives of Peter and Paul in the side aisles echoing early Christian church decorations of Rome. Tronzo (1997) has demonstrated that this scheme represents a later phase of decoration, added perhaps by William I at a time when the space, which originally functioned as a royal audience hall, was transformed into a more conventional nave. Essentially the same pattern would be applied on a much grander scale at the cathedral of Monreale, decorated under William II in the 1180s. Here, while the execution and style of the mosaics remain authentically Byzantine, the last vestiges of a Byzantine iconographic program are to be found in donor portraits which echo their counterparts at the Martorana, as well in the monumental bust of the Pantocrator, now relegated to the central apse in the absence of a dome.

Venice and the Upper Adriatic from the Eleventh to Fourteenth Centuries

In Venice, as in Norman Sicily, the production of mosaics began with the importation of craftsmen and materials from the Byzantine empire. In the course of the twelfth century, however, Byzantine-trained Venetian workshops became increasingly western in their leanings, even as they responded to repeated waves of Byzantine artistic transformation up to the mid-fourteenth century.

The earliest mosaics in the Venetian ambient are to be found in the cathedral of Torcello, a direct dependency of Venice. The twelve apostles in the lower zone of the central apse follow closely the style of the mid-eleventh-century mosaics of Hosios Lukas in Greece, and are most likely the work of Byzantine artisans. These compact figures show the same tendency toward essentially linear modeling and a certain harsh contrast of light and shadow, which gives the draperies a metallic

quality. Also attributed to the same Byzantine workshop at midcentury are the mosaics of the right side chapel and the lower zones of the *Last Judgment* on the west wall. The chapel mosaics, once erroneously thought to be as early as the eighth century, represent a middle Byzantine type of enthroned Pantocrator in the apse flanked by archangels, four bishops in the hemicycle below, and, in the vault, four angels supporting a medallion containing the lamb of God—a composition that evokes the presbytery vault of San Vitale in Ravenna. The west wall of the Cathedral Torcello displays a vast composition of the *Last Judgment* in four registers, faithfully transmitting distinctive Byzantine elements of iconography, including the central Deësis (Christ with Mary and John the Baptist as intercessors) in the upper zone, the *Etimasia*, and the regurgitation of the dead by creatures of the land and sea. Christ appears again farther up the central axis on the west wall in the *Anastasis* and the *Crucifixion*. These mosaics were conceived and originally executed in the second half of the eleventh century, but Andreescu-Treadgold (1972) has shown that parts (e.g., the upper body of Christ in the *Anastasis* and the upper bodies and heads of the trumpeting angels on the right side) were restored after the earthquake of 1117. This earthquake also led to the restoration of the upper parts of the apse and triumphal arch: here the *Virgin and Child-Hodegetria* in the conch, and the *Annunciation*, including the dynamic striding figure of the archangel Gabriel, were not completed until the second half of the twelfth century.

The late eleventh-century mosaics of Torcello have close relatives elsewhere in the upper Adriatic: in the surviving heads of Mary, John, and Peter from the destroyed apse mosaic of the basilica Ursiana at Ravenna, firmly dated by inscription to 1112; and the slightly later mosaics of the Madonna and child and apostles in the left apse of San Giusto in Trieste. These mosaics, in turn, are closely related to the earliest mosaics in San Marco in Venice. Although mosaics may already have decorated the first ducal chapel constructed to hallow the relics of the adopted eastern apostle, translated from Alexandria in 828-829, the present church was not begun until the mid-eleventh century (it was dedicated in 1094); and the earliest extant mosaics in it are generally accepted to be those of the Virgin and child, apostles, and evangelists set within the niches surrounding the central portal from the western

narthex. Demus (1984) dates these to the 1070s. The elongated figures, standing in rather rigid poses with limbs held tightly to the body, are related in style to mid-eleventh-century mosaics at Torcello; but the cloth, now less metallic, is more softly modeled in a way that is closer to the early Comnenian style of Byzantine art c. 1100.

The original mosaics on the interior were begun as early as 1084 and were largely complete by the mid-fourteenth century. The interior space of San Marco, which copies the three-aisle, five-dome cruciform plan of Justinian's Church of the Holy Apostles in Constantinople, also reflects, in part, the decorative program of that church. The Venetians wanted to justify their appropriation of Mark from Alexandria by setting his relics within a church that would be appropriate for an eastern apostle. Adapting the middle Byzantine convention, the three domes on the east-west axis are occupied by theophanic visions of Christ, who appears at the apex of each composition in the heavenly realm. However, the subjects are arranged in chronological sequence in three broader eras of sacred history according to standard western schemes. The eastern dome features an *Emmanuel* with Old Testament prophets foretelling the coming of the messianic Christ; the central dome depicts the *Ascension of Christ*, the culmination of Christ's terrestrial mission and passion narrated on the supporting barrel vaults; the western dome represents the beginning of the era of apostolic mission and the present church with the descent of the Holy Spirit at Pentecost.

Stylistically, these mosaics of the central axis also reveal a general progression of work from east to west, moving from the statuesque, restrained figures of the apse to the agitated, emotionally expressive figures, in late Comnenian style, of the central dome and the passion cycle (c. 1180s-1190s) to the more restrained and monumental figures in the Pentecost dome representing the trans-European "style of 1200."

This broader narrative of biblical history is customized by the extensive mid-twelfth-century narratives that show how Mark became the apostle of the regions of the "Venices" and patron saint of the city (Dale 1994). Mark's supposed mission to Roman Aquileia on the *terra firma*, which Venetians used as the basis for their own claim to Mark as a local apostle, is represented symbolically in the hemicycle of the central apse by the passing of the gospel from Peter to Mark, and thence to Saint Hermagoras, the first bishop of Aquileia. A more

extensive narrative was added to the vaults over the two choir chapels in the mid-twelfth century. In the chapel of Saint Clement, the pre-Venetian history of Mark is represented: his mission to Aquileia and the consecration of Hermagoras as his successor and first bishop of Roman "Venetia" on the terra firma; his mission to Pentapolis; and his mission and martyrdom in Alexandria. The cycle in the chapel of Saint Peter is devoted entirely to the theft of Mark's relics and their translation to Venice. The culminating scene showing the ceremonial reception of the relics by the doge and patriarch of Venice-Grado, reminiscent of the Justinian panel in Ravenna, confirms the importance of Mark's relics for the sacrosanct authority of the Venetian state and church.

Early in the thirteenth century, the program of the interior was expanded by two significant narrative cycles. In the north transept, the life of the Virgin Mary is narrated in a distinctively Venetian "late Romanesque" style, marked by heavy contours, disproportionately large eyes, emphatic gestures, and rather clunky architectural props. Another, more sophisticated workshop of Venetian mosaicists was responsible for the extensive cycle of the *Agony in the Garden*, narrated in an unprecedented six episodes. Here, for the first time in Venice, the Byzantine gold ground gives way to an extensive landscape setting. We see here, too, an emphatic use of gesture. The figure style as a whole represents a more monumental version of the late Comnenian style applied in the mosaics of the crossing (the "Ascension workshop").

Two more mosaic cycles of the thirteenth century update the Venetian version of Saint Mark's career. First, two large panels on the west wall of the south transept, probably made under Doge Ranieri Zen (r. 1253–1268), represent the doge, clergy, and people of Venice praying for, and witnessing, the miraculous recovery, or *apparitio*, of the lost relics of Mark in 1094. Set within recognizable cross sections of San Marco, these scenes not only recorded sacred history, but also served as models for the ongoing ritual commemoration of the "invention" or rediscovery of Mark's relics on the annual festival of the *apparitio* instituted under Doge Zen. A second, updated narrative of Mark's mission and translation to Venice begins on the vault of the Cappella Zen, once an open portal facing the Piazzetta and the Grand Canal, and extends across the west facade over each of the four side portals. The cycle on the vault of the Cappella Zen includes a new emphasis on the

writing of Mark's Gospel and adds a crucial prophetic scene known as the *Praedestinatio*: a vision in which Mark learns, on his way to Alexandria, that his relics will one day "return home" to Venice. The *Translation* cycle, much more detailed than the earlier version, appears to add one new episode over the Porta di Sant'Alipio—the sole surviving panel from the thirteenth century, which may be interpreted as a rededication of the present church of San Marco after the recovery of the relics (Dale 1994). It shows the reception of the relics by the doge, patriarch, and Venetian populace at the door of the present church, complete with marble revetment and bronze horses added to the facade after the Fourth Crusade in 1204.

Paralleling this latest edition of the legend of Mark, an Old Testament cycle was added to the cupolas and barrel vaults of the L-shaped narthex or "atrium" between the 1240s and 1270s. The narrative begins in the southwest corner of the atrium with the creation of the world and the story of Adam and Eve and extends up to the life of Moses in the easternmost bay of the north branch. Executed in a distinctly archaizing style and iconography, in an unusually dense narrative sequence, most of the atrium cycle (up to the second bay of the north branch) is based on a fifth-century manuscript, the Cotton Genesis. According to Demus (1984, Vol. 2), the Venetians may have acquired this manuscript in Alexandria and used it to reinforce both their claim on that city's apostle and their own connection to the apostolic era. The scope of the cycle, which culminates with the departure of the Israelites from Egypt, was also probably designed to reinforce a notion of the Venetians as a new "chosen people," following their participation in the Fourth Crusade.

The last significant medieval additions to the mosaic program of San Marco date from the time of Doge Andrea Dandolo (r. 1343-1354). The baptistery mosaics include an extensive cycle of the career and martyrdom of John the Baptist and a mosaic over Dandolo's tomb featuring a portrait of the doge beneath the crucifixion; the mosaics of the chapel of Saint Isidore on the south side of the church narrate the trial and martyrdom of the titular saint whose relics were translated by Doge Domenico Michiel from Chios in 1125. Both cycles, as Pincus (1990) has argued, were designed to amplify the role of the doge in the sacred history of Venice and underline the presence of its saintly

protectors. Stylistically, these mosaics represent a Venetian synthesis of Palaeologan art at the Byzantine court with the rarefied costume and jewel-like palette of contemporary French art. The iconography and technique of the mosaics remain thoroughly Byzantine, but the elegant costumes and somewhat elongated proportions of figures, such as Salome in the baptismery, reflect a broader assimilation of French models in Italian painting of the fourteenth century.

The Maniera Greca and Mosaic Production in Rome and Tuscany in the Late Duecento and Trecento

Pope Honorius turned to Venetian craftsmen to execute the apse mosaic of San Paolo Fuori le Mura in the 1220s, but by the end of the *Duecento*, mosaic work was again flourishing in Rome, and for the first time under the tutelage of well-documented, celebrated artists who worked in fresco and panel painting as well. Among the pantheon of Vasari's first age—the *primi lumini* of the Renaissance—Pietro Cavallini, Jacopo Torriti, and Giotto are the most prominent artists to have designed mosaics in Rome. They drew inspiration from renewed contact with Byzantine art—which was also the main impetus for the flourishing craft of panel painting—and also from close study of early Christian and medieval monuments in Rome itself.

Pietro Cavallini, who participated in the restoration of the early Christian frescoes in the nave of San Paolo Fuori le Mura between 1282 and 1297, was also called on to restore and supplement the twelfth-century mosaics of Santa Maria in Trastevere in the late 1290s. The scenes of the life of the Virgin, arranged as a predella-like frieze beneath the *Coronation of the Virgin*, synthesize a predominantly Byzantine iconography with a solid figural modeling and an exploration of illusionism in architectural settings that Cavallini seems to have developed in part from his study of early Christian monuments in Rome. While scenes such as the *Presentation* use stage-prop pavilions, viewed from different angles of vision, the *Nativity of Mary* is presented within an interior space, set against curtained walls—the same spatial conventions that are developed further in the Isaac cycle of the upper church of San Francesco in Assisi. Coloristically, Cavallini's

mosaics have the lighting techniques of his own frescoes: strong contrasts of light and shadow within the same hue lend sculptural presence to his figures.

Cavallini's contemporary Jacopo Torriti was favored with two important commissions by Pope Nicholas IV. Following the insertion of a transept before the sanctuary of the Lateran, Torriti executed mosaics for the facade and apse (dated 1290), based largely on early Christian predecessors: a bust of Christ, connected with a miraculous vision at the foundation of the basilica by Constantine, hovers over a gemmed cross from which spring the rivers of paradise. Both mosaics were almost entirely remade by nineteenth-century restorers.

Much better preserved is Torriti's apse mosaic in Santa Maria Maggiore, completed in 1295, three years after Nicholas IV's death, by the Colonna family. The conch presents an updated version of the *Coronation of the Virgin* in Santa Maria in Trastevere: Mary and Christ, still based on icons used in the liturgy for Assumption day, are now enthroned within a mandorla, flanked by throngs of angels on either side and by two processions of saints standing in the earthly paradise below. Highlighting her roll as mediatrix in the festival of the Assumption, Mary appears here with arms outstretched in prayer while Christ places the crown on her head. An inhabited vine scroll, which folds the upper reaches of the conch, and a shell motif at its apex both evoke the apse of San Clemente as a model. Paralleling Cavallini's work in Trastevere, the life of the Virgin is narrated in a frieze immediately beneath the conch. In this case, however, Torriti places the *Dormition of the Virgin* out of narrative order on the central axis directly beneath the *Coronation* in order to emphasize her bodily resurrection. The precise chronological relationship between the two mosaics is still a matter of debate: Gardner (1973, 9–10) sees Torriti's scheme as improving on Cavallini's "earlier" model to produce a better-integrated design; but Tronzo (1989, 169–171) argues that the Cavallini mosaics postdate those of Torriti to c. 1298 and were added by the Stefaneschi family to update the apse of their church in a spirit of competition with their rivals, the cardinals of the Colonna family. Stylistically, Torriti is much closer than Cavallini to contemporary Byzantine art: he is much less interested in the exploration of spatial illusionism, allowing his figures to remain close to the picture plane. In the modeling of figures in the conch, he

uses the convention of gold highlights and coloristic contrast more than chiaroscuro modeling. The proliferation of gold, together with a rich palette combining delicate pearl, rose, and lilac with deep red, azure blue, and green, enhances the decorative unity of surface.

Torriti's work in the interior of Santa Maria Maggiore was complemented by mosaics on the west facades and exterior of the main apse, executed at least in part by Filippo Rusuti in a closely related Byzantinizing style. According to Gardner (13-41), these mosaics were completed under the Colonna cardinals before their fall from grace in 1297. Both projects were designed to proclaim, in a very public way, the cult of the Virgin Mary and her icon, the *Salus Populi Romani*, housed within the church, and must have been addressed to the throngs who joined the Assumption day procession and other outdoor manifestations related to the stationary liturgy. (Comparable facade mosaics survive or are known to have existed at Santa Maria in Trastevere, old Saint Peter's, and San Paolo Fuori le Mura.) The mosaic (no longer extant) of the apse facade depicted the *Salus Populi Romani* icon flanked by Virgin saints. The mosaic of the main facade, partly damaged and obscured by the later benediction loggia, has in its upper zone the enthroned Christ, following the same type as the apse mosaics, flanked by angels and an abbreviated hierarchy of saints headed by the Roman apostles, Peter and Paul, set against a gold ground. Filippo Rusuti's name appears in the border of the mandorla at the feet of Christ. The lower zone, following a format similar to that of the lower zone of the apse mosaic within, is devoted to four narrative panels relating how the church was founded through the intervention of the Virgin Mary. The *Madonna of the Snows*, shown in these mosaics following the type of the *Salus Populi Romani*, is said to have appeared independently to Pope Liberius and the patrician John, urging them to found a church in her honor and outlining the ground plan of the church in the fresh-fallen snow. Three of the four scenes are represented in highly illusionistic domestic interiors that push Cavallini's experimentation with interior backdrops farther in the direction of the Francis cycle at Assisi and Giotto's frescoes in the Arena Chapel. The inclusion of the Colonna family arms in this zone helps date the project as a whole either before 1297, as Gardner argues (22ff), or during the restoration of the Colonna family after the death of their rival Pope

Boniface VIII in 1303 and before the death of Cardinal Pietro Colonna in 1337. Wollesen (1998, 105ff) dates the lower zone to c. 1306–1307, largely on the basis of stylistic connections with the *Legend of Saint Francis* in the upper church at Assisi. It is often assumed that a different artist was responsible for this zone, but it is also possible to see the greater illusionism of the architectural setting as a distinctive stylistic mode, appropriate to the vernacular subject.

The most celebrated mosaic made in Rome at the end of the Middle Ages is Giotto's *Navicella*, which represents the story of Peter walking on water to meet Christ in the midst of a storm (Matthew 14:24-32). This mosaic was commissioned by Cardinal Stefaneschi (d. 1341) for the atrium of old Saint Peter's, perhaps as early as 1308-1310. It was heavily restored in 1618 and was dismantled and removed to its present location in 1629, before the destruction of the medieval atrium, but at least its iconography was faithfully recorded in sixteenth- and seventeenth-century drawings and a full-scale cartoon on linen (commissioned from Cosimo Bartoli in 1628). It was also copied as early as the fourteenth century in a fresco at Saint Peter's in Strasbourg (1320) and in Andrea di Bonaiuto's fresco in the Spanish chapel at Santa Maria Novella in Florence (1365). The composition was dominated by a great ship containing the apostles, set on a diagonal in the midst of stormy waters. As is typical of Giotto's work, the apostles' individual emotional responses were conveyed through varied gestures and facial expressions. Peter appeared just to the right of the ship before a larger than life-size figure of Christ. Near the lower border a fisherman sits on the bank, opposite a kneeling figure of the donor. As far as one can tell from two angels thought to have come from an upper border of the mosaic, Giotto applied to this work the same sculptural chiaroscuro modeling that he used in his Ognissanti Madonna c. 1310. Mosaic, as it had been in late antiquity, was once again assimilated to illusionistic painting.

The design or execution of mosaics by well-traveled and much sought-after artists such as Giotto and Cavallini contributed to a transformation of mosaic art in Tuscany, at the same time that Giorgio Vasari would describe Tuscan painters as surpassing the *mankra greca* or Byzantine style. Cenni di Pepi, known as Cimabue, establishes a direct link between Rome and Tuscany: he is recorded in Rome as early

as 1272 as *pictore de Florencia*. His only firmly documented work still extant is a mosaic figure of Saint John the Evangelist in the apse of the cathedral of Pisa. In September 1301, he took over the execution of the larger mosaic featuring Christ enthroned between Mary and John from a certain Francesco di San Simone a Porta a Mare, and in February 1302, after ninety-four days of work, it is documented that he had completed the figure of Saint John (White 1993, 175–176). The Pisan mosaic as a whole, completed in 1321, is strongly influenced by Byzantine art; its composition adapts the conventional *Deësis* intercessory group by substituting John the Evangelist for the John the Baptist. Cimabue's figure, however—with its monumental, sculptural forms achieved by bold chiaroscuro modeling and firm, rounded contours; and with the softness of its cloth—reveals the artist's experience of mosaics and frescoes by Pietro Cavallini in Rome.

In Florence, there appears to have been an efflorescence of mosaic decoration in the last four decades of the thirteenth century. Parallelling the contemporary rise of panel painting in Tuscany, the art of mosaic seems to have been inspired to a large extent by Byzantine models, albeit transmitted earlier in the Italian tradition. Mosaics survive in three of the most important civic churches in Florence: the Romanesque basilica of San Miniato al Monte, which has the remains of the city's first martyr; the baptistery, which was also the primary focus of the cult of a more recently acquired patron saint for the city, John the Baptist; and the cathedral itself. In San Miniato, mosaics depicting Christ enthroned flanked by Mary and the patron saint appear both on the exterior facade (c. 1260) and in the main apse (1297) to reinforce the intercessory presence of Florence's first martyr. Both mosaics repeat Byzantine iconographic conventions and are formally quite conservative, using gold highlights for limited modeling of draperies; but the jewel-like palette may owe something to mosaic work in Venice.

The baptistery contains one of the most impressive ensembles of mosaic decoration outside Rome and Venice, and it draws inspiration from both sources in its formal vocabulary and iconography. The mosaics in the barrel vault over the sanctuary represent the *Mystic Lamb* in the middle of a wheel supported by four telamons and surrounded by prophets; and on the haunches of the vault there are iconic enthroned images of John the Baptist and the Madonna and

child. These mosaics have often been attributed to a certain Franciscan named Jacobus and dated as early as 1225 on the basis of an inscription in the sanctuary. However more recent scholarship discounts this date and favors instead a connection with the painter Coppo di Marcovaldo starting in the 1260s. Some of the work in the baptistery is attributed to Coppo's followers. The monumental figures of prophets and the two iconic images appear to have been executed by or under the inspiration of Venetian masters c. 1300.

The interior decoration of the octagonal cupola, originally executed c. 1240-1310, is dominated by a vast *Last Judgment* on the west side, featuring an immense figure of the enthroned Christ, flanked by angels, apostles, the celestial paradise, and hell. The figure of Satan with three ravenous mouths devouring sinners in hell may be counted among the visual sources for Dante's vision in the *Inferno* of a three-faced Satan in the lowest circle of hell. The remaining portions of the vault are divided into six zones, framed within illusionistic colonnades. Extending the eschatological program of the *Last Judgment*, the upper two registers at the apex of the cupola represent the celestial paradise and Christ flanked by the nine orders of angels. The lower four registers are devoted to the Old Testament narrative of Genesis (from the creation to Joseph) in two registers, the infancy of Christ, the passion of Christ, and, finally, the life of John the Baptist. The basic program here, and even specific aspects of the iconography of the Old Testament, evoke a long-standing Roman tradition of church decoration that can be traced back to two early Christian basilicas: old Saint Peter's and San Paolo Fuori le Mura.

Stylistically, the mosaics of the dome are difficult to attribute, owing to extensive restorations. They were repaired in the late fourteenth century, and again in the fifteenth century, and underwent particularly extensive restorations in the late eighteenth century, in the early nineteenth century, and again at the beginning of the twentieth century. Nonetheless, a number of original documents, together with the accounts of Giorgio Vasari and other sixteenth-century sources, indicate the names of some of the artists who worked on the vault and tribune mosaics between the 1260s and the 1340s. Most prominent among the artists recorded by Vasari are Andrea Taffi, who is said to have initiated the work in the upper tiers after learning the craft from

Venetian mosaicists; a Byzantine artist brought from Venice named Apollonio the Greek; and Gaddo Gaddi (the father of Taddeo), whom he assumes Taffi took on to assist in completing the mosaics of prophets in the tribunes. Other, better-known Tuscan painters who have been connected with the mosaics through documentary evidence and stylistic comparisons include Coppo di Marcovaldo (especially with regard to the composition of hell), Cimabue or a closely related master (with regard to the birth and naming of John the Baptist), and Deodato Orlandi (with regard to the last part of the John the Baptist cycle).

To Gaddo Gaddi, one of Vasari's masters in the baptistery, is also attributed the late thirteenth-century mosaic of the *Coronation of the Virgin* in the lunette over the central doorway of the interior facade of the *duomo*. The central figures of Christ and Mary, which combine Byzantine physiognomic types and conventions of chrysography with a greater sculptural quality and a tentative exploration of space in their turning poses, suggest the influence of another great name associated with the mosaic art in Tuscany, Cimabue. Perhaps, as Giusti suggests (Paolucci 1994), this mosaic was made as early as the 1280s for the facade of Santa Reparata and was later transferred to the *sopraporta* of the new facade, completed by Arnolfo di Cambio in 1296.

Eventually, the quintessentially medieval medium of mosaic, inextricably associated by Vasari with the bad influence of the *maniera greca* on Tuscan painting, no longer enjoyed the same prestige it had claimed for 1,400 years. Mosaics continued to be produced—primarily to replace damaged medieval examples with new compositions, or for the purposes of restoration. But in an era dominated by artistic personalities, mosaic ceased to be an autonomous medium hallowed by traditional modes of design and a certain inherent abstraction. In the hands of great Renaissance painters such as Castagno, Titian, and Tintoretto, all of whom worked on the mosaics of San Marco, the overall unity of design by which medieval mosaicists bound figures to surface was transformed by the introduction of modern costume, perspective, and illusionism.

Moschi, Lorenzo

Unfortunately, we know almost nothing about the life of the Tuscan poet Lorenzo Moschi, except that he probably lived during the second half of the fourteenth century. The most complete collection of his poems survives in Riccardi manuscript 1103, which, however, was not transcribed in Tuscany. The section of his poetry begins with the sonnet *Gli occhi che mi ferir si dolcie mente* under the title *Sonetto dilorenzo moschi dafirenze*. Although this would lead one to believe that Moschi was Florentine, no mention of him has yet been found in historical records. Moschi's chief literary models are the *stil novo* poets and Petrarch (Francesco Petrarca). Petrarch's influence is notable in *Benedetto, sia l'ora e la stagione; Rallegrati, querceto, e le tue fronde*; and *Spirto, che fai che pur pensi d'amore*. Moschi's diptych of sonnets—*Iddio vi salvi, donne oneste e care* and *Ben vegni tu che per lo tuo parlare*—represents an imaginary colloquy between the poet and a group of young women, a motif not uncommon in the work of the *stilnovisti* (compare Dante's *Rime* 70 and 71; Cino da Pistoia's *Gentil donne valenti, Vedete donne*, etc.). Similarities have also been found between Moschi's verses and those of Francesco di Vannozzo.

Moscoli, Neri

Neri Moscoli was a prolific but undistinguished Perugian lyric poet of the *Trecento*, Little is known of his life: manuscript Vaticano Barberiniano 4036, the sole manuscript source for his poetry, describes him as coming from Città di Castello, and he is mentioned in a Perugian document of 1333. He was thus a contemporary of Cecco Nuccoli and Marino Ceccoli, and he seems to have taken part in poetic *tenzoni* with the latter, but his large output—two *canzoni* and more than 100 sonnets—lacks, on the whole, their verve and emotive power. Though some of his work is clearly indebted to *poesia giocosa*, the bulk of it belongs to a more self-consciously elevated tradition, deriving from the *dolce stil novo* and based on the idea of love as service to the lover's lady. The melancholy note struck in many of Moscoli's sonnets has led critics to detect a particular affinity with Cavalcanti.

Motet

The motet was probably the most important form of polyphonic music—both sacred and secular—during the Middle Ages. Originally a sacred composition that developed from the liturgical trope, the motet eventually became the preeminent form of secular art music by the late medieval period. Its basic structure contained a fundamental musical line, called the tenor or *cantus firmus*, arranged into a continually recurring rhythmic pattern, above which one or more voices (up to three) would move at a generally faster rhythmic pace, with different Latin or French texts. The motet itself evolved and was adapted structurally in different areas of Europe, so that its history and composition can vary greatly during the same time period in different geographical areas.

The motet originated from the school of sacred composers centered on the cathedral of Notre Dame in Paris in the middle to late twelfth century. By the thirteenth century, the most important developments in the motet were the formulation of rhythmic modes, the loosening of the tenor rhythm, and the introduction of the vernacular into texts. By the fourteenth century, the styles of certain composers were being followed enough to allow scholars to refer to certain motet styles—such as the Franconian style, named after Franco of Cologne, and the Petronian style, named after Petrus de Cruce. The *ars nova* composers in France in the late fourteenth century and the early fifteenth, especially Guillaume

de Machaut, developed the motet into a complex rhythmic structure that helped to create our modern system of musical notation. Features such as isorhythm and numerical symbolism came to the fore. The constant struggle between the music and the text for primacy and importance was an impetus for the many evolutions and transformations of the motet throughout the medieval period.

Before the fifteenth century, Italy produced very few motets (not even six Italian motets survive), owing to a seeming distrust of the *cantus firmus* technique. Northern composers such as Johannes Ciconia and Guillaume Dufay, who were in residence in Italy in the early fifteenth century, helped to transform the motet by creating monotextual pieces and incorporating the technique of imitation then in vogue at the Franco-Flemish court.

Muda

During the fourteenth century, the commune regularly organized

annual government convoys, the *muda*, from Venice. Each season, the Great Council of Venice determined how many great galleys would sail to each colony. Patricians were allowed to bid at auction for the privilege of outfitting and manning each galley, and of conducting the enterprise profitably. Profits from the voyage went into the pockets of the patrician who won the auction. Each convoy sailed at a specific date to a specific destination, where it remained for a certain time, and then returned to Venice within a particular time. Records indicate the dates, destinations, and auction prices of *muda* to Romania (Constantinople and the Black Sea), to Alexandria, to Syria (the *muda* of cotton), and after 1317 to Flanders. The sailing dates were fixed, depending on the length of the voyage; the *muda* left Venice in April or May to return in July or September, or left Venice in August to return in the late fall or the following spring. The repayment calendar for Venetian loans and rents revolved around these regular dates. Not all cargoes traveled in the great galleys; many Venetian merchants conducted their business from private ships throughout the Mediterranean. Most of the commerce in the fourteenth century between the Adriatic, Ionian, and Aegean seas was carried privately on smaller Venetian ships or on the great round ships, the cogs.

LOUISE BUENGER ROBBERT

Muscia, Niccola

The comic poet Niccola Muscia (Muscia da Siena, late thirteenth century) is known for three sonnets. *Ecci venuto Guido a Campostello* is of interest because of its parody of the poet Guido Cavalcanti on the occasion of an interrupted pilgrimage to Santiago de Compostela. The sonnet pokes fun at Cavalcanti's lack of strong religious convictions and enumerates many less than pious reasons for which he might have undertaken the voyage. The mocking of suspect pilgrims was a popular theme of Galician-Portuguese comic poetry. The other two sonnets—*Dugento scodelline di diamanti* and *Giùgiale di quaresima a l'uscita*—parody the genre of the *plazer*. They enumerate ridiculous objects the

poet wishes to give a certain Lano, identified as the Lano da Siena mentioned by Dante (*Inferno*, 13.115-129). There is some uncertainty—due to questions raised by Vitale (1956) on the basis of scanty evidence in the manuscript tradition—about whether Muscia da Siena can be identified with Niccola Muscia; however, most scholars concur that the two names refer to the same poet.

Naples

History through the Eighth Century

The site of the sprawling modern city of Naples has been, continuously, a major center of human habitation perhaps longer than anywhere else in western Europe. The superb location attracted Oscans, Samnites, and Etruscans. And then, around the sixth century B.C., Greeks arrived as colonists. Later, the Romans created major ports along the Bay of Naples, and in addition the region became the prime resort area for Roman emperors and senatorial families, who found the many traces of its Greek period particularly attractive. Innumerable distinguished Romans retreated there to write or to enjoy the area's luxurious baths. But soon there was also a network of Christian catacombs; and as Christianity became established throughout the Italian peninsula, the city and its environs acquired an impressive array of churches and shrines.

It is important to bear all this in mind when considering medieval Naples, for the area's traditions strongly influenced the city's later history. Inevitably, from one era to the next, the shape and form of the city itself changed; Roman Neapolis, for example, occupies only a small portion of the area covered by the Naples of Frederick II. And the duchy of Naples, the city-state that flourished between those periods, encompassed the entire bay and considerable inland territory as well. Yet through all these permutations Naples never forgot its distinctive past, its ancient roots.

In the turmoil of the sixth century, when Justinian's armies sought to reclaim Italy from the Ostrogoths, Naples remained loyal to the Ostrogothic king and suffered grievously for this. Shortly afterward, however, when Lombard invaders began to penetrate the south, the city

welcomed a Byzantine connection, and for the next three centuries it could legitimately be viewed as a real, if distant, segment of the Byzantine empire. Constantinople apparently dispatched new, Greek-speaking settlers to swell the diminished population, and Naples was expected to keep in contact with the Byzantine exarch at Ravenna.

But the eighth century brought change again, particularly after the exarchate collapsed in 751. It was arranged that thenceforth Naples would report to the Byzantine governor of Sicily, and for a time there was still at least some Byzantine control. Moreover, Naples in turn exercised some degree of authority over two smaller Byzantine satellites, Gaeta (farther north along the Tyrrhenian coast) and Amalfi (to the south). Nonetheless, by the second half of the eighth century it was obvious that Naples was not in every sense "Byzantine." The bishop of Naples and other local religious leaders answered to Rome, not Constantinople; the liturgy was Roman, and priests went to Rome to study. Furthermore, while many Neapolitans read Greek, had Greek-derived names, and signed documents in Greek letters, Latin remained the normal language of communication. Politically, too, the lay elite seems to have included both "pro-" and "anti-" Byzantine factions. And by the early ninth century, Naples was plainly choosing its own dukes without consulting the Byzantines, and minting its own distinctive coinage.

The Duchy of Naples

In contemporary documents, we find the duke of Naples called sometimes *consul et dux* and sometimes *magister militum*. But whatever its ruler's title, in the early ninth century the duchy spread almost all the way around the Bay of Naples as well as inland to the east and north for some distance. Also, by the ninth century the office of *dux* had become more or less hereditary, with only rare deviations when the elite of Naples (the *optimates* or *nobiliores*) became seriously disaffected. As for other governmental structures, we have little precise information except that disputes were settled with the aid of a *judex*. We know, too, that the *nobiliores* reveled in titles and that Naples had a highly stratified society, which may have meant fewer possibilities for

lesser individuals. Nevertheless, the setting of Naples provided many advantages, and much of its land area was exceptionally fertile. All could thus have gone well had it not been for one fact: pressing against the borders of Naples were the Lombards, who by the start of the ninth century had been dominating most of southern Italy for 300 years.

Again and again the Lombards had attacked Naples, and over time they had nibbled away portions of the duchy's territory. The Lombards' aggression was surely one reason Naples had adhered to its Byzantine connection, which represented at least hypothetical protection (even though, now, there were seldom Byzantine armies in southern Italy). Yet by the 830s Byzantium was losing Sicily to the Arabs; all too plainly, it was no longer in any position to help. So at that point, when the Lombards threatened once again, Naples hired Arab mercenaries.

Almost immediately, in response, the Lombard princes of Benevento and Salerno hired their own Arab forces. Arab sea-raiders had been harassing the Tyrrhenian coast for decades. Now some Arabs were being handed the opportunity to create a place for themselves within southern Italy, and they made the most of it. For the rest of the ninth century, the political balance in the region was to be affected by the presence of marauding Arab bands—who benefited not only from the Lombards' desire to take Naples but from the fact that Benevento and Salerno were soon also at war with each other. When in addition, in 846, an Arab army from Sicily and North Africa actually invaded the city of Rome, looting Saint Peter's and other major churches, the German emperor Lothair I sent his son Louis south with a large contingent of troops. Later, after Louis himself became emperor (Louis II), he found it necessary to spend much of his reign in southern Italy, trying desperately to expel all the Arabs. Next, after Louis's death in 875, the problem of the Arabs became a preoccupation of Pope John VIII. Then, in the last two decades of the century, Byzantine forces suddenly reappeared in southern Italy, seeking both to drive out the Arabs and to take advantage of the general disarray.

Perhaps surprisingly, Naples profited from this ninth century turmoil. The Lombards, now fighting each other, and subject also to pressures from Louis II, the pope, and Byzantium, were usually too busy to harass Naples. So Naples, remaining on excellent terms with the Arabs, flourished. There was increased commerce with the Arab world and,

simultaneously, an exceptional flowering of culture. New churches were built in the city, and old churches were richly embellished. Moreover, although Naples was now in effect autonomous, the Byzantine connection held firm in some respects; many Byzantine manuscripts were imported (and translated) during this period, some of them highly significant for subsequent developments in western culture.

The most notable figure in this ninth-century Neapolitan renaissance" was the duke and bishop Athanasius II (r. 876-898), who personified several of the duchy's distinctive characteristics. Most of Naples's bishops were key members of the ducal family, but sometimes, as in the case of Athanasius, duke and bishop were one and the same, governing both church and state. Furthermore, the elite of Naples prided itself on literacy in both Greek and Latin and indeed on a level of learning far exceeding that typically encountered elsewhere in contemporary southern Italy. Athanasius exemplified this. But he also exemplified the wiliness demonstrated by Naples's rulers as they strove, over the centuries, to preserve their duchy and enhance its power. Athanasius had become duke, ousting his brother with the help of Pope John VIII, and had apparently promised to expel all Arabs from Naples and to sever all links with the Islamic world. In fact, however, he soon proved even more pro-Arab than his predecessor, and openly contemptuous of the sentence of excommunication pronounced by the pope. Naples, under Athanasius, continued defiantly determined to go its own way.

If the turbulence of the ninth century had been of benefit to Naples, the relative tranquillity of the tenth century worked in some ways to Naples's disadvantage. The region's last Arab band (encamped north of Naples, along the Garigliano River) was wiped out in 915. And Naples actually helped in this campaign. Arab depredations had apparently worn down even the duchy's tolerance. But, in addition, something seems by then to have weakened Naples's Arab connections. In the tenth century, Amalfi, now no longer subject to Naples, dominated trade with the Islamic sphere and profited from it. Meanwhile—another change—the Lombard principalities (Capua-Benevento and Salerno) had ceased battling each other and thus were now flourishing to such a degree that Naples shrank in importance.

This last development did have its positive side. The Lombards

seemingly lost interest in taking the duchy; instead it became a convenient refuge for any Lombards at odds with their rulers. Furthermore, beginning in the late ninth century, Naples had begun to figure on occasion in marriage alliances with the Lombards; by now, ethnic differences had come to seem less significant, and Naples was admired for its traditions. It also preserved its reputation for learning; at Monte Cassino, for example, the tenth century's most distinguished abbot, Aligernus, was a Neapolitan. Nonetheless, on the whole Naples appeared detached from major events during the tenth century. In the second half of the century, when the German emperors Otto I and Otto II tried to exert authority over southern Italy, and came into conflict there with Byzantium, the confrontations mostly took place well to the east and south of Naples; the duchy was seldom involved. It seemed mainly to be living on its memories and even to be somewhat stagnant.

Early in the eleventh century, however, the entire situation in southern Italy changed again, radically, for it was then that the first Norman adventurers appeared. From the late ninth century on, Byzantium had been dominant in southern Italy's easternmost region and its southern extremities (in other words, throughout most of Apulia and Calabria), while the Lombards held the central and northern portions, as well as all of Campania with the exception of Naples and Amalfi. Time and again the Lombards had fended off the Byzantines' attempts to take over the whole, but in the early eleventh century Byzantium looked stronger and more determined than ever. It was apparently this new struggle that attracted the first Normans; they saw opportunities for profitable employment as mercenaries. And in this they were not disappointed; Normans soon were hired by both Lombards and Byzantines. In the ensuing chaos, even Naples found itself under attack. And so c. 1030, to gain help from one prominent Norman, the duke of Naples granted him the fortified town of Aversa, within the territory of Naples. In the ninth century, Naples had been the first to import Arab mercenaries. Now it was the first to give southern Italian land to a Norman.

This was a fateful move. Other Normans began to demand land of their employers as well, or simply to seize segments of Lombard or Byzantine territory. By the end of the 1070s, less than half a century later, the last surviving Lombard principality (Salerno) had fallen to the

Normans, who had also conquered Byzantine Apulia and Calabria. Only Naples, ever resilient, still retained (together with Amalfi) some measure of autonomy. But this was not to last much longer. For a time, the Normans were preoccupied by power struggles among themselves and by local rebellions in many parts of southern Italy. In 1130, however, Roger II, by then the unquestioned ruler of both Sicily and mainland southern Italy, secured a papal bull granting him authority over all southern Italian territory—and the wording specifically included the "honor of Naples" (*honor Neapolis*). Over the next two or three years, Roger was too busy elsewhere to act on this papal authority in relation to the duchy. In 1134, however, Duke Sergius VII found it necessary to swear allegiance to Roger. And when, shortly afterward, Naples dared to side with some rebels, Roger began a siege of the city that lasted nearly two years. By mid-1137, Sergius was again forced to swear allegiance; and this time, as a demonstration of loyalty, he and a Neapolitan force were compelled to join Roger's army, fighting in Apulia. There, Sergius was killed in battle. He was Naples's last duke.

Naples under the Normans

The duchy's territory and the city itself were soon fully integrated into the Norman kingdom of Sicily. It is not entirely clear how the city fared under Norman rule; documentation is sparse. However, one of Roger's sons was named prince of Capua, and he apparently spent considerable time in Naples (now treated as part of the Capuan appanage). He and later Norman overlords engaged in major building projects within the city, to enhance its fortifications and also to create a suitable palace for royal visits. Both the Castel dell'Ovo and the Castel Capuana date from the Norman period. However, while the Normans thus made some use of Naples, it never figured large in their scheme of things; the city of Salerno, their most significant Campanian conquest in the previous century, far surpassed Naples in importance. Even after Naples had been taken, Salerno continued to serve as the Normans' mainland capital.

Those members of Naples's leading families who demonstrated loyalty seem to have been allowed to retain at least some of their

property, as feudal fiefs. But other elements of Neapolitan society appear to have suffered. This was clearly true of ecclesiastical Naples; the powers of the archbishop were much reduced by the Normans, and contemporary charters indicate financial hardship for many of the city's countless small religious establishments. Furthermore, the middling class of laymen (merchants, artisans) found their opportunities even more restricted under Norman governance than had been the case in the status-conscious duchy.

Their discontent, and doubtless also discontent on the part of at least some of the elite, apparently led Naples to share in the general urban opposition to Norman rule during the reign of William I, Roger I's implacable son. Since Naples was never as severely punished for rebellious behavior as some other south Italian cities, we must assume that no dramatic outbreaks took place there. Nonetheless, the existence of strong feelings seems indicated, if only indirectly, by a development in 1190. In that year, Tancred, the last Norman ruler, made a special point of granting privileges, including considerable local autonomy, to Naples. Tancred, whose right to the Norman throne was contested by the German emperor Henry VI. was desperately in need of support. He apparently viewed Naples as especially valuable as a potential ally and believed, correctly, that a major grant of privileges would win him the city's allegiance.

In fact the Neapolitans did fight valiantly on Tancred's behalf, withstanding a fierce attack by a combined land-sea force dispatched by Henry VI. By 1194, however, Tancred was defeated, and Naples under Henry VI was again reduced to playing a minor role within a centralized monarchy.

Naples under the Hohenstaufen

Naples suffered from the harshness of the Emperor Henry VI and showed little loyalty to the Hohenstaufen. Henry destroyed the walls and abolished the privileges of Tancred. On his death (1196), however, these privileges were revived and once more Naples became, for practical purposes, virtually autonomous. The attempt of Henry's son, Frederick II, to establish a rector there prompted Naples to recognize his

rival, Otto of Brunswick, as emperor in 1212; but after Frederick's triumph the city again lost its autonomy. Frederick came there in 1220—1222, when he set up a new constitution, placing the municipal government under the justiciar of the Terra di Lavoro at Capua. The office of the former chief magistrate, the *compalazzo*, was, however, continued. This officer—first instituted by Roger II after the ending of the duchy, as his representative to administer royal finances and to act as judge in the king's name—had continued to head the administration, theoretically in the king's name but in practice as an executive officer of the commune. Under Frederick, he again became a means through which royal control of the town was exercised. Frederick appointed him through his local representative, the master chamberlain, and gave him a court of fourteen lawyers to assist him.

Frederick took measures to encourage the maritime commerce of Naples; later he further boosted the Neapolitan economy by abolishing tolls on commerce going from one province to another within the Regno. He promoted Naples as a subcapital on the mainland, using the castles, particularly the Castel dell'Ovo, as his mainland treasury, and even founding a university. Naples's new prosperity did not, however, prevent rebel lion—a conspiracy was uncovered in the Regno centered on Naples in 1246 and was cruelly repressed; and on Pier della Vigna's death in 1249, more unrest arose, which turned into a rebellion against Frederick II's sons, Conrad and Manfred, when Frederick died (1250). Naples then passed under the direct lordship of the pope, who authorized it to form a free commune: the first *podestà* was appointed in 1251. In 1253, however, Conrad came south, and after a long siege he took Naples. Apart from destroying the walls, he was merciful to the city and even confirmed its constitution. But in 1254 he died. Soon afterward, Pope Innocent IV, claiming overlordship of the Regno, came to Naples and confirmed its constitution. In 1256, Manfred reconquered Naples; but he never won its allegiance, and when Charles of Anjou invaded the Regno, Naples offered little resistance.

The Hohenstaufen did not undertake extensive building in Naples. Frederick built a palace, subsequently occupied by Piero della Vigna, and effected minor repairs on the castles, but the main interest of the Hohenstaufen was in Apulia and Sicily.

Naples under the Angevins

Politics and society. After Manfred's defeat at Benevento, Naples became the capital of Charles of Anjou's kingdom. In it were established the headquarters of the grand justiciar, the vicar and the captain of the Regno, the financial administration (the grand chamberlain, the treasury, the *camera sommaria*—i.e., chamber of accounts), and the mint: Palermo became no more than the capital of the island of Sicily. The city on the whole repaid its promotion with loyalty: it showed little support for Conradin; and although there was a rising after the Sicilian Vespers, it was minor.

Charles, coming from France, made his French followers prominent in Naples. From 1266, Naples had a French archbishop, a French justiciar, and many other French officials. French was used in the royal chancery (though Latin still predominated). A French architect, Pierre de Angicourt, was employed on all Charles's castles; early Angevin castle architecture shows much French influence. All newly founded churches were in the Gothic style and show varying degrees of influence from the Ile-de-France. But apart from architecture, the long-term effect of the French was not great; the Neapolitan *monzu* ("cook") was derived from the French *monsieur*, and there are some other linguistic borrowings, but surprisingly few.

Charles I died while his heir was in prison. The papal legate, Gerald of Parma, governed Naples for the vicar of the realm, Charles II's twelve-year-old son Charles Martel, until Charles II was freed. The war of the Sicilian Vespers reached the Bay of Naples in 1287 and the area of Gaeta by 1289 but did not touch the city itself. Once freed, Charles II established his court in Naples at the recently completed Castel Nuovo. Of the events that took place there, among the most remarkable was Pope Celestin V's resignation in 1294, while the pope was visiting Charles.

Under Charles II and his heir, Robert the Wise, the presence of the court brought prosperity to Naples. The luxury trade increased along with a thriving arms trade. Most of this trade was handled by foreigners, especially Florentines and Genoese, who benefited from it perhaps more than the Neapolitans; but the industry that it generated and the increased wealth that was brought into the city improved the

economic situation for everybody. The population rose to approximately 40,000 in the 1290s and may have reached 60,000 under Robert.

Joanna I's reign saw chaos, mismanagement, and declining prosperity in Naples, as elsewhere in the Regno. These were made worse by an earthquake and flood in 1343, the cataclysm of the black death in 1348, and another earthquake in 1349. There are no precise indications of the mortality in this decade, but the European average of one-third of the population is probably not far out for Naples. Added to these disasters were those arising from brigandage, which became so bad that trade into the city was seriously disrupted and life there became very unsafe. The various political crises of the reign excited mob violence in Naples, particularly in 1346, when Joanna was slow to take action against the supposed murderers of Andrew of Hungary; in 1363, when a feud broke out between two noble factions; and in 1374, when a riot—provoked by famine in the city—broke out against Joanna's government (though not against her personally).

Saint Bridget of Sweden visited Naples during Joanna's reign and vehemently castigated the immorality and luxurious life of Naples. Other writers echoed Bridget's views.

At the end of her reign, Joanna lost the support of Naples: her main adversaries, Pope Urban V and Charles III of Durazzo, overthrew Joanna and her supporters. Charles was able to retain the loyalty of the city when he later quarreled with Urban. It was ill rewarded: when Charles died, Naples was still in a state of disorder.

Constitutional developments. Charles I kept the provincial divisions of Frederick II, so Naples remained a part of the Terra di Lavoro and became again subject to its justiciar. Communal liberty declined rapidly, but some local government remained. The nobles were divided into groups known as *tocchi* (a term apparently of Greek derivation, originally referring to their meeting places). Because each group was in one *platea* (*piazza* or subdivision) of the city, the *tocchi* were also often called *platee*. The *popolo* or non-nobles were likewise divided into *platee*, which might or might not overlap with the noble *platee*. Some ten of the *platee* contained both *popoli* and nobles; five were exclusively noble, and the rest (fourteen) were popular. Above the *platee* were the two *università* (communes) of the nobles and the *popolo*. These rarely

acted together, but each had certain rights and a designated meeting place. Their main importance was for taxation. The annual subvention in the Regno was usually assessed by communes according to an estimate of the number of taxable households in each commune. In Naples, however, the nobles and the *popolo* were assessed separately, and each *università* then raised the tax through assessments on each *platea*. There was also an *università dei casali* for the outlying villages, but these were taxed as individual communes. The system was inequitable, falling more heavily on the *popolo* than the nobles. (In 1301, of a tax of 692 *untie*, 72 came from the five noble *platee*, 450 from the exclusively popular ones, and the rest from those of mixed composition). It also weighed more heavily on some *platee*—it could even prompt some people to change their *platea* of residence.

The magistrate above the *università* until Charles arrived was the *compalazzo* who had powers of justice in the city. As more of these powers were assumed under the Angevins by the justiciar of the Terra di Lavoro, the position of the *compalazzo* declined, though he retained certain fiscal responsibilities, notably fixing the prices of victuals and controlling measures, in consultation with the provincial authorities. He also had special jurisdiction over the university students and the communities of foreign merchants (mostly from northern Italy, except for the Jews), who had their own organizations in specific areas of the city (many in the newly developed suburb near the Castel Nuovo). His office came increasingly to resemble that of the *baiuli*, the normal executive officers of other cities of the Regno, and by the fourteenth century he was usually simply called the *baiulo*. Around 1300, a further change in the administration put the control of the economic life of the city in the hands of six *eletti* for whom the *baiulo* became merely an executive. Five of these six were chosen by the noble *tocchi*. The sixth was chosen from the *popolo* and represented all twenty-nine divisions of the city, but a process of combining several *platee* had already reduced these to about sixteen.

Under Robert more changes were made in the structure of government. The number of *platee* was further reduced, probably to ten. Then, in 1339, the so-called ordinances of peace were issued, whereby the two major noble *platee*, Capuana and Nido, legitimized their growing power, gaining the right to one-third of the jobs in the

city (*onerum et honorum*). The remaining two-thirds went to the rest of the city, nobles and *popolo*. At the same time it was specified that *popolo* meant the *popolo minuto* (the urban masses including small shopkeepers, journeymen, laborers, etc.). This was an imported distinction borrowed from northern Italy. A memory of former subdivisions remained in the *sedili* in which these congregated and which replaced the former *tocchi*. There were three of them—Porto, Montagna, and the *sedile del popolo*—making, with Nido and Capuana, five in all. The *sedili* do not survive, but later drawings of them show that they were buildings about ten meters square with open arches on all sides surmounted by a cupola. Their fifteenth- and sixteenth-century successors were richly decorated, as the Angevin originals probably were. Meetings between people from different *sedili* were forbidden, except in the case of the six *eletti*. The reforms had indifferent success in quelling unrest in the city, particularly among the nobles.

Under Joanna there was little development in government or administration, except that, for the first time, guilds of artisans were given official recognition in the city's constitution. They may also have been given military functions, though this is unusual and has been disputed.

Angevin building and artistic patronage. Charles of Anjou enlarged and reinforced the Castel dell'Ovo, which he made the royal residence until 1281, when it became predominantly a prison, while the court moved to the Castel Nuovo, begun two years earlier. The Castel Nuovo was essentially in French Gothic style (now somewhat masked by Aragonese accretions) and was more comfortable and commodious than the earlier Neapolitan fortresses. In addition to the Castel Nuovo, Charles undertook several building projects in Naples, also in French Gothic style—notably the Franciscan church of San Lorenzo Maggiore, built on the site of an earlier Romanesque building; and Sant Eligio al Mercato, with a hospital attached.

Of Charles II's public buildings, the most important were probably the *duomo* (begun in 1294 and completed under Robert); the enlargement of San Domenico and the building of a Dominican church and convent dedicated to Peter Martyr; the church of Santa Maria di Donnaregina; the massive rebuilding of the arsenal; the replacement of the Porta Pisana by a new gate; and the erection of several palaces for

members of the royal family and other courtiers. Streets were paved, public fountains were erected, and new woods were planted on the hill of Sant' Elmo. Naples became more international in its artists: notably, the Roman painter Pietro Cavallini was employed on the painting of Santa Maria di Donnaregina, though it is doubtful that the overall scheme was his, as has sometimes been suggested.

Under Robert the Wise, the *duomo* was completed. The church and convent of the Poor Clares, Santa Chiara, were started around 1310; and a fortress and a Carthusian monastery (San Martino) were begun on the hill of Sant'Elmo. Santa Chiara is basically Gothic but with Islamic and Romanesque features. Santa Chiara shows the growing eclecticism of Neapolitan architecture: it is a hall church with a rectangular choir instead of an apse to the east, designed as a semi-independent church for the Poor Clares; and a double-arched cloister on the Sienese model. It became the accepted burial place of the Angevins. A second hospital, the Annunziata, was founded in 1318. Otherwise, Robert's building was not notable. His patronage of the arts, however, was far in advance of that of his predecessors (though by comparison with northern contemporaries Robert's reputation in this respect seems inflated). Still, if Naples itself produced few first-class artists and *litterati* (though there were several whose abilities were not to be despised), some of the greatest names in both categories worked there. Simone Martini produced, in addition to his famous portrait of Saint Louis of Toulouse, a *Christ Blessing* for Santa Chiara and probably other works no longer extant. Giotto was in Naples in 1328–1332: none of his paintings from that time survive, but there are references to several in contemporary writings. On the literary side, Petrarch is perhaps the best-known visitor—he was "examined" by Robert (whom alone Petrarch agreed to accept as judge) for the laureate later conferred on him in Rome (8 April 1341). Boccaccio also came, though his sojourn under the next monarch, Joanna, is perhaps better known. In addition to his patronage, Robert also started a library (dispersed again under his daughter), one of the essentials for the budding humanist courts of the fourteenth century.

Joanna's principal ecclesiastical foundation was Santa Maria dell'Incoronata, a curious church with two unequal naves terminating in apses. Sant'Antonio *abbate*, with a hospital adjoining it for the care

for those with ergotism (burning fever), was also founded in her reign. Otherwise, Boccaccio briefly enjoyed her patronage, but the upheavals of her reign left little scope for artistic developments.

The university. In 1224, Frederick II had founded the university—the first in Europe to be deliberately established with a foundation charter. It included all faculties, but theology was taught only by the friars, and when the Dominicans left Naples in 1234 (because of Frederick's dispute with the pope), the university declined. Under Conrad, it was moved to Salerno, where there was already a medical school, but it was almost moribund when Manfred returned it to Naples a year later. It revived somewhat under Charles I—though the revival was limited to the faculty of law (theology and arts were taught by religious bodies but were not highly valued; medicine was taught at Salerno). It was subject to royal authority in all matters. The students were under the authority of the royal chancellor and the jurisdiction of a specially appointed royal justice. Degrees were granted in the king's name after an examination by the doctors that took place in the royal court. The degree of control may perhaps explain why Naples produced no prominent scholars.

A Note on Sources

There is no adequate history of the city or duchy of Naples in English, but the references listed below include histories in Italian that have good bibliographies. Although the royal archives of Naples were destroyed during World War II, with a consequent loss of most medieval records, registers have, to some degree, been reconstituted by scholars such as Riccardo Filangieri and J. Mazzoleni.

Nardo Di Cione

The Florentine painter Nardo di Cione (died c. 1336), with his brothers

Andrea (called Orcagna) and Jacopo, dominated painting in Florence in the decades following the black death of 1348. Nardo's date of birth is not known. His name appears for the first time in 1346-1348 in a list of members of the guild of doctors and apothecaries, the guild to which the painters belonged. By then his reputation was already established, for c. 1348, when the authorities of Pistoia asked the Florentines for the names of their best painters to execute the high altarpiece for Pistoia's church of San Giovanni Fuorcivitas, Nardo was recommended along with Orcagna. At this time the brothers were living in the parish of San Michele Visdomini and may have shared a workshop. In the 1350s and the first half of the 1360s Nardo lived in the center of Florence, but not always in the same parish as Orcagna, although the two of them may have continued to work together. In 1356 Nardo signed a panel of the Madonna which hung in the offices of the Gabella dei Contratti but which no longer survives. And in 1363 he was paid for painting "the vault and other things" in the oratory of the confraternity of the Bigallo; only fragments of this work remain. These are the only two works to which his name can positively be attached. Nardo made his will in 1365, and by May 1366 he had died. Apart from a bequest to the Bigallo, he left his money and possessions to be divided equally among his three brothers—Andrea, Jacopo, and Matteo. Since no wife or children are mentioned, Nardo was probably a bachelor. These few facts are all we have for a working life that can be documented over some twenty years. Although most of Nardo's painting seems to have been for locations in Florence, he may also have worked elsewhere. At an unknown date the Pistoian painter Bartolommeo Cristiani entered into an agreement whereby whenever he worked outside Florence, Nardo would help him. In an altarpiece now in Prague the presence of Saint Ranieri, a patron saint of Pisa, suggests that Nardo may have painted it for a church in that town.

Nardo is credited with about a dozen surviving works comprising frescoes, altarpieces, and small-scale devotional panels. In reconstructing an oeuvre for him, Offner (1960) relied on stylistic evidence provided by the frescoes in the Strozzi Chapel in Santa Maria Novella (Florence), which Ghiberti, writing in the mid-fifteenth century, ascribed to Nardo. Here, on three walls, Nardo represented the Last Judgment with a scene of heaven and a hell in which the imagery is

derived from Dante's description in the *Inferno*. The frescoes are probably contemporary with the altarpiece in the same chapel that Orcagna painted between 1354 and 1357. The decoration of the Strozzi Chapel exemplifies the Florentine taste in art after mid-century, a taste that departed in some ways from the more naturalistic style pioneered by Giotto. Spatial illusionism is rejected in favor of more abstract two-dimensional effects. The saints of Nardo's *Paradise*, for example, are stacked up tier on tier, like, as one writer said, a football crowd. Medieval conventions of scale, in which a figure's place in the hierarchy of the holy is indicated by his size, are strictly followed. God's divinity and the otherworldly piety of the saints tend to be emphasized at the expense of their humanity. The holy figures appear self-absorbed, preserving their distance from each other and from the spectator. Some of these characteristics may be seen in Nardo's large-scale panel of the Virgin and saints belonging to the New York Historical Society and his altarpiece with three saints in the National Gallery, London.

This reversion to what have been seen as archaizing modes of representation that draw on late thirteenth-century formulas has been explained in terms of the unsophisticated and conservative taste of a new bourgeois class in Florentine society (Antal 1948) and the psychological effects of the black death (Meiss 1951). However, Nardo's art evinces less obviously than Orcagna's the somber, pessimistic mood that Meiss identified in the art of Florence and Siena after 1348. Nardo's style is more lyrical and less austere than that of his brother; his color combinations are more harmonious, and the facial expressions of his saints are less intimidatingly severe. His stylistic origins lie in the decorative taste of Florentine painters such as Bernardo Daddi and the Sienese school as exemplified in the sumptuous work of Simone Martini. Bright enamel colors are juxtaposed with opulent brocades and patterned floors, as in the polyptych in Prague and the two panels with saints in the Alte Pinakothek in Munich. Nardo's Madonnas in Prague, Washington, and Minneapolis have a distinctive beauty that led Offner to describe him as "the most romantic artist of his age." The delicate *sfumato* modeling of pale flesh tones enlivened with rose-pink on the cheeks and lips, and of blond hair draped with diaphanous veils, is achieved by a patient application of successive layers of semitransparent glazes. The consummate care that Nardo lavished on

his paintings—in the preparation of the panel, the detailed underdrawing, the meticulous application of paint and the painstaking execution of *sgraffito* and gilded punchwork—make him possibly the finest craftsman among *Trecento* painters. As a result, his works are remarkably well-preserved.

Nardo's reputation has fared less well. History has been unfair to Nardo. He has suffered from standing in the shadow of his more famous brother, Orcagna. Vasari must share some of the responsibility for this: he got the artist's name wrong (calling him Bernardo), relegated Nardo to the role of assistant in Orcagna's workshop, and credited to Nardo inferior works that were actually by others. Even now, despite Offner's study, Nardo has yet to receive the attention that is his due.

The eunuch Narses (c. 480—c. 575) was of Persarmenian origin. He is first encountered, in his mid-forties, as a bodyguard commander and trusted official early in the regime of Emperor Justinian. After playing a major role in the defeat of the Nika riots in 533, Narses seems to have developed military ambitions.

In 538 he was sent to Italy to reinforce an expedition of the great general Belisarius against the Ostrogoths; but their personalities clashed, and Narses identified himself with dissident commanders whose squabbles disrupted Belisarius's progress, Narses's actions were held to be responsible for the loss of besieged Milan to the Goths, and for the ensuing massacres and destruction there. Eventually Justinian recalled Narses, leaving the field of action clear for Belisarius.

But Narses continued to enjoy the emperor's trust and respect, achieving the high court rank of grand chamberlain. Quiet and unprepossessing; not highly educated, but reportedly very bright; quick at grasping situations; remarkably courageous; and capable of inspiring great loyalty, Narses was not given his great opportunity until he had reached an advanced age. After Belisarius's final failure and recall, Justinian was persuaded to make one last effort, choosing as commander this eunuch then in his mid-seventies.

Narses was able to draw on such resources as Belisarius never had, and he proceeded energetically through 551 to gather an army in the Balkans, mainly of Lombards and other barbarian peoples. In early 552 Narses marched his army around the Adriatic headland into Italy to confront the Gothic king Totila at Busta Gailorum or Teginae (present-day Gualdo Tadino) in the Umbrian Apennines along Via Flaminia. Totila was utterly defeated and died in the aftermath of the battle. Narses's forces began claiming possession of key points through Italy, taking Rome. The remaining Goths rallied and, choosing the general Teias as their king, faced Narses again at the end of 552 below Mons Lactarius (Monte Lattario), on the slopes near Mount Vesuvius. Once more, Narses destroyed their army, their king, and much of their remaining manpower; acceding to the request of the pitiful Ostrogothic remnant, he allowed the survivors to go in peace, out of Italy and into oblivion.

In 554, at Capua, Narses wiped out an invading army of Franks and Alamanians who had hoped to profit from the turmoil. The taking of

Verona in 561 extinguished the last pocket of Gothic resistance and completed Justinian's conquest of Italy. In 555, meanwhile, Narses arranged a public ceremony in Rome to establish the credibility of the new pope, Pelagius I. Settling in the imperial capital at Ravenna as resident governor, Narses undertook to restore order in the battered peninsula. Justinian's death in 565 brought to the throne Emperor Justin II and his consort Sophia who, hostile to the venerable Narses, ordered his recall. Later traditions have it that, in revenge, Narses was responsible for inviting the Lombards to begin their invasion of Italy, but such charges are incompatible with his apparent integrity and humane character. Though some accounts place his death in Rome, he apparently returned to retirement in Constantinople, dying there c. 575, in his mid-nineties. Stories are told that his hoarded wealth was hidden and then discovered after Narses's death by the avaricious emperor.

Navigation

A modern dictionary defines navigation as "the science or art of conducting ships from one place to another, using instruments to determine a ship's course, its position at a given time, the distance passed, etc." Before the Middle Ages, navigation could hardly be described in this way. In one sense, of course, seafarers had always navigated, in that they set out with a specific destination in mind and used all available skills to get there; only the legendary Saint Brendan put to sea with no plan, content to let the currents and winds determine his landfall. What we would consider instruments, however, did not play a role.

In the west, the first steps in the adoption of navigational instruments are particularly associated with Italy and its maritime republics. Some elements may have owed something to external influence, perhaps even from well beyond the Mediterranean. Nonetheless, all surviving sources point to Italy as the core region in which all the disparate components came together.

The first and most significant of these instruments was the maritime compass. Its evolution is somewhat controversial. The magnetic properties of one type of iron had been recognized in the Hellenistic era (and perhaps even earlier), but we do not know when or where men first discovered that a needle-like pointer rubbed against a chunk of magnetite, and then allowed to rotate freely, would invariably point north. Some scholars have placed this discovery in northern Europe, noting that an Englishman of the late twelfth century, Alexander Neckham, first reported sailors using a treated needle floating in a bowl of water. Yet Neckham is thought to have made at least one trip to Italy, and over the next fifty years all subsequent references to this primitive form of the compass suggest a Mediterranean context. For example, Guyot de Provins, who made such a reference around 1205, had gone to the Holy Land during the Third Crusade; and an Arab narrative from Cairo describes just such a device in use on a voyage from Syria to Alexandria in the 1240s. The references in Guy de Provins and the Arab narrative do not, of course, point specifically to Italy. For that matter, experts on China note that somewhat similar magnetized indicators were described there well before any western mentions; they therefore place this first stage in China, postulating some form of transmission to the west. However, this debate seems almost irrelevant, for neither a

needle-in-a-straw floating in a bowl nor the somewhat similar Chinese gadgets would have enabled mariners to "navigate" in anything even remotely approaching the modern sense. Progress toward that capability demanded some further refinement, a genuine leap forward. And for that, Italy apparently does deserve credit.

Lane (1963) hypothesized that the last quarter of the thirteenth century was the decisive period in the development of a proper, practicable compass. Around 1280, the Italian maritime republics began to dispatch merchant ships overseas at all times of the year; winter, with its typically overcast days and starless nights, was no longer a closed season. Lane assumed that this change would not have been possible had there not been, by then, some improved sort of directional device: presumably the needle pivoted dry, with its pivot built into a little box. (And in fact it is notable that in the fourteenth century a common shorthand term for the compass was *pyx* or *pyxis*, a term otherwise used for the little round box in which the communion host was carried.) Lane further suggested that by 1300, the compass card or wind rose had become a standard component of these self-contained instruments. Moreover, Lane was prepared to credit Amalfi, in southern Italy, for these ultimate refinements, since later centuries would associate Amalfi with the "invention" of the compass. In granting Amalfi a key role in relation to the compass, Lane was in general agreement with Motzo (1947), and with Taylor (1956), whose work on navigational history still stands as the most valuable survey of this complex story. Taylor, however, like Motzo, put Amalfi's contribution much earlier, associating Amalfitan sailors with early use of the needle-in-a-bowl.

Whatever the truth in relation to the compass and Amalfi, Italy unquestionably figures in the other great thirteenth-century advance. This was the development of the portolan chart, a totally new approach to mapmaking. Clearly designed for nautical use, portolan charts were surprisingly close to modern maps both in concept and in the accuracy of their coastal outlines. They were large, were drawn in black and colored ink on whole lambskin or calfskin, and typically showed the Mediterranean region and the Black Sea (later, even England) with all harbors and islands, as well as coastal features such as prominent headlands, meticulously indicated. Such hazards as rocks or shoal waters were also sometimes marked.

Portolan charts are sometimes viewed as simply the pictorial equivalent of the narrative navigational guides known as portolans, which also began to proliferate in Italy from the latter thirteenth century onward. The earliest surviving example of these portolan guides is the somewhat confusingly named *Compasso da navigare*, now dated to c. 1250 and probably Pisan; it directed the mariner around the Mediterranean step by step, from port to port, noting sailing distances from one place to the next, as well as landmarks and hazards along the way. Yet there is in fact no demonstrable link between the portolan guides and the portolan charts. The guides represented a continuation of a Hellenistic and Roman tradition: the dissemination of written itineraries, often incorporating useful local information in addition to suggested routings. (Medieval portolans would also, in time, evolve into broad-ranging handbooks for maritime ventures.) Portolan charts, on the other hand, were something new, and conceptually very different. They made it possible to see at a glance the geographical relationships within (for example) the entire Mediterranean—a vital feature should circumstances dictate deviations from the standard routes. These charts represented a true advance over the past and presaged a totally new approach to seafaring.

The earliest surviving portolan chart is apparently the *Carte Pisane*, thought to be late thirteenth-century and also thought, despite its name, to have been produced in Genoa. The next such charts (some of them incorporated into portable atlases) were unquestionably made by a Genoese, Pietro Vesconte, mostly while he was in the service of Venice.

The first Vesconte chart is dated 1311, and (the earlier dating of the *Carte Pisane* is challenged by some scholars. Nonetheless, it is generally accepted that something resembling these examples was indeed available by the latter thirteenth century, for a passenger described a sea chart in use in 1270 on a Genoese ship carrying the King Louis IX to North Africa. Inevitably, then, there has been much debate as to whether the refining of the compass was directly connected to the development of portolan charts. Certainly, one distinctive feature of these charts is the web of intersecting "wheels" positioned over the water areas, with the "spokes" of the wheels suggesting rhumb lines, and the whole very like an overall pattern of compass roses. It is notable, too, that each "wheel" has sixteen of these "spokes," just as the

early compasses used sixteen winds as surrogates for directions or compass points. Yet one should not make too much of this. In Italy, one can track back to Etruscan usage a sixteen-point division of the horizon (whereas in the Greek world a twelve-point division seemed standard). Thus this element of similarity may merely reflect a long-standing regional tradition.

In any case, it would surely be a mistake to assume that portolan charts were newly "invented," as adjuncts to the compass. It is more likely that both of these navigational aids had evolved slowly, and independently, over a long period of time. The needle-in-a-bowl-of-water may have come about as an adaptation of an ancient magic trick or some quasi-religious rite. And portolan charts surely also had more primitive prototypes, although none has survived. The most one can safely say is that by the latter thirteenth century, given the competitive climate in the Mediterranean, any enhancement of navigation would doubtless have seemed highly desirable to shipowners. The dramatic increase in maritime commerce undoubtedly put experienced mariners at a premium. For those less experienced (or as Lane proposed, for those sailing in winter), the possibility of some form of help must have had great appeal. This, we must assume, provided the stimulus for the refining of both the compass and the sea chart.

Of course, both the compass and the early portolan chart were still relatively crude instruments. At least to some degree they were complementary, and by the latter fourteenth century we often find both listed in various records as part of a ship's equipment. Portolan charts, however, while a vast improvement over the impressionistic world maps of earlier days, were still in essence freehand drawings, with their information about coastal outlines presumably patched together from mariners' reports. (It is therefore remarkable that they came so close to genuine cartographic accuracy.) But they did not indicate latitude, although the concept was recognized and latitude could have been at least roughly calculated. Moreover, a method for determining longitude was still many centuries away; and not until the time of Mercator, in the sixteenth century, would there come to be a satisfactory way of dealing with the sphericity of the globe. Finally, in addition, the "north" indicated by early compasses was only approximately north. All in all, truly precise navigation by means of instruments was still a long way

in the future.

Perhaps for this reason, anecdotal evidence suggests that these new devices were initially of less interest to the generality of sailors than to poets and intellectuals. The directional aspect of the compass needle appealed to Italian poets such as Guido Guinizzelli and, notably, Dante. And as early as the end of the thirteenth century Ramon Llull, an extraordinary Catalan philosopher-scientist, described an elaborate system of navigation involving compass and chart and mathematical tables. But Llull's approach was apparently not actually used at sea until two centuries later. Meanwhile, in the real world, so to speak, the lawyer poet Francesco da Barberino, writing c. 1315, advised those traveling by sea to carry their own *pyx* or proper compass, and he describes a ship's navigator as using only the old needle-in-a-bowl.

All together, then, while it is important to note the period in which the self-contained compass and the portolan chart first became available, it is equally important not to overestimate the immediacy of their impact on routine seafaring. Lane was clearly correct in calling the late thirteenth century a turning point; plainly, however, not everyone turned instantly. Some of the surviving portolan charts, especially some known to be Italian in provenance, show clear signs of having been used, presumably at sea. But others (including some of the splendid products of Catalan-Majorcan cartographers) were surely designed for affluent armchair sailors. Real sailors are notoriously slow to change their ways; one need only think of Columbus's minimal use of the instruments available in his day. In the late thirteenth century and the fourteenth, entrepreneurial shipowners of Genoa and Venice no doubt pressed compasses and charts on their ships' navigators. But we may suspect that for some time these new aids were in fact used only sporadically—and then not for navigation in the modern sense but only when mariners were blown off course and were therefore desperate for any sort of assistance. Pryor (1988) has indicated how standardized most routes were. When sailing familiar routes, most mariners doubtless still relied mainly on their own knowledge and experience, not on these new toys. The one destination that may have provided an exception was England. It is noteworthy that, in the 1320s, the Vesconte charts grew ever more exact in their depictions of that region, already of interest to Genoa in the late thirteenth century and rapidly becoming

of interest to Venice, but surely unfamiliar territory for most Mediterranean seamen.

Many of the portolan charts are truly beautiful, especially some of those done in the fourteenth and fifteenth centuries for rich patrons. Fanciful animals and people were sometimes depicted on the more remote landmasses, and colorful symbols or flags often marked key ports. These handsome versions of portolan charts tell us that men in positions of power were beginning to find seafaring romantic and interesting. And this may in fact have been one of the most important contributions of the medieval navigational advances; both the compass and the chart obviously captured the imagination even of many who had no direct involvement with the sea. It apparently became fashionable to own elegant versions of such "instruments," just as exploration would now begin to become fashionable.

There was also one other effect. Until quite late in the medieval period, science and technology advanced on essentially separate tracks. However, as the example of Ramon Llull indicates, the mariner's compass and the chart attracted the attention of science-minded philosophers. The intellectual challenge that navigation presented would increasingly draw theoreticians to address practical problems. This trend would not really bear fruit until well into the fifteenth century, when Portugal, not Italy, exemplified maritime innovation. (Only then, for example, do we find the quadrant, a simplified version of the Arab astrolabe, beginning to be used at sea.) Nonetheless, the compass and the portolan chart had marked the start of this slow march toward instrumentation. By the fifteenth century, both were widely accepted, and the making of portolan charts was spreading beyond the Mediterranean. But Italy's contributions had not been forgotten. For a long time, despite the accomplishments of the Portuguese, Italian navigators retain an enviable reputation for maritime skill and knowledge.

Nelli, Francesco

What little we know of the life of Francesco Nelli (Francesco di Nello Rinucci, d. 1363) has been transmitted through his correspondence with Petrarch, which is preserved in Paris (Bibliothèque Nationale, MS Lat. 8631.) Nelli wrote at least forty-five letters to Petrarch, thirty of which are still extant—the largest group of letters to Petrarch from any one correspondent. Nelli and Petrarch met in 1350, when Petrarch passed a few days in Florence on his way to Rome, and then again on his return. Boccaccio had invited Petrarch (the poet laureate) to Florence and assembled a group of like-minded admirers, including Nelli, to meet

him. It seems probable that these few days in Florence were the only time when Petrarch and Nelli met face to face; yet this was enough time for them to form a close friendship, which would continue until Nelli's death. At the time of Petrarch's first letter to Nelli (6 April 1351; *Lettere disperse*, 29), Nelli was the prior of the Chiesa dei Santi Apostoli in Florence, and Petrarch often praised him for his piety—e.g., *Tu pietate prior, tu religione praestantior, et familiaror Deo* (*Lettere disperse*, 20). Nelli was a Florentine by birth and, as Petrarch noted, had not traveled far beyond his city: *semper sedes, nunquam patrie limen transis* (*Lettere disperse*, 56). From the letters, we learn that Nelli was a man of medium height and distinguished bearing (*Familiarum rerum libri epistole*, 20.7), slightly younger than Petrarch himself (*Rerum senilium libri*, 22.2). The correspondence reveals Nelli's passion for classical learning: he sought out texts for Petrarch, collated and edited manuscripts, and read avidly. Nothing remains of Nelli's own writings apart from the letters; he may have written poetry but seems to have preferred prose composition. In reference to Nelli's status as a priest and a poet, Petrarch awarded him the name *Simonide* in their correspondence; Boccaccio also uses this name in his *Epistola a Nelli*. Nelli was also a close confidant of Petrarch in political matters and was one of the recipients of Petrarch's *Epistolae sine nomine*, which criticized the papal curia at Avignon. Nelli had long had links to the Acciaiuoli family, and in 1361 he began working for Niccolo Acciaiuoli, the grand seneschal of the kingdom of Naples. However, the frenetic pace of his diplomatic activity weakened Nelli, and he fell ill and died of the plague in the summer 1363. Petrarch's sorrow at his friend's death was expressed in a letter to Boccaccio (*Rerum senilium libri*, 3.2).

Neoplatonism

Though much of the work done during the period of middle Platonism (first century B.C. through the second century after Christ) has perished, its general tendencies were taken up by Neoplatonism, the final stage in the ancient reappropriation of Plato. Neoplatonism begins with Plotinus (205-269 or 270), who was probably born in Egypt and came to Rome after studying with Ammonius Saccas in Alexandria. Plotinus's writings, which reflect live lectures and discussions, were edited by his student Porphyry in sets of nine treatises (*Enneads*) arranged in philosophical order beginning from those which deal with physical matters and ending with the supreme "one."

In Plotinus the earlier middle Platonic schemes of reality appear as a three-level hierarchy. At the top is the "one" or "good," absolute unity and simplicity so utterly self-contained as to be beyond any relationship and therefore beyond direct knowledge as well as beyond being. Since the "one" does not exist as other entities do, it can be spoken of only indirectly, often in terms of a mystical encounter, and Plotinus is a major source of later negative theology in the west. As the ultimate origin of everything, the "one" can be likened to the sun emitting light or to a fountain pouring out water in a process of emanation that accounts for what does actually exist. Since the "one" is beyond time, the material world, which is its last product, has neither beginning nor end in time, though it does exist temporally.

The initial product of emanation is the second great reality (hypostasis), mind or being, fusing what is with what thinks. Because mind both contains and is its own thought, subject and object coincide in it. Plotinus thus places Plato's perfect forms inside mind, which is accordingly omniscient and enjoys timeless contemplation of their perfect reality. This supreme mind lies beyond the ordinary discursive, temporal consciousness of our minds, and Plotinus can describe its state of intuitive knowledge in eloquent religious terms. Platonism in general turns on the relationship between the one and the many, and

emanation, too, is a process of emergent multiplicity. All forms united in mind but without loss of identity constitute a one-in-many.

The next stage is the third major hypostasis, soul. Here multiplicity increases to form a many-in-one in which time first appears. The farthest extent of emanation at this psychic level comes at the point where reality fades into nonbeing, i.e., matter. For matter simply is absence of form, characterized as total darkness and insubstantiality; being negative, it is not itself a hypostasis, though it does paradoxically correspond to the "one" in that both are outside existence and beyond knowledge, the "one" because it is more than what actually is, matter because it is less. Matter is the raw stuff for soul's temporal and spatial activity, by which it is transformed into the highly complex material universe composed of bodies, i.e., matter and the forms brought into it from mind through soul. This is the domain of nature directed by a single great world soul while including also numerous individual souls linked to lesser bodies within the universe.

A salient characteristic of emanation is overlap between stages. Since mind is a projection of the "one," it exists only through a connection back to its source; by the same token, it is the source from which soul, in turn, comes and toward which it strives. As a result, a line of force—the great chain of being—runs from and back to the "one." Because the "one" is also the good, reality is inseparable from value, and so an objective guarantee for ethics is ensured. Furthermore, the immense vitality of the physical universe as a whole is an expression of two opposed yet complementary drives in soul. In so far as descent toward matter involves deterioration, emanation is a fall, and soul's longing ("love") to return to its origin explains the Neoplatonists' frequently hostile attitude toward body as a source of moral evil as well as their ideal of retreat into the intellectual self. The inner, real world is nonmaterial; hence the relative unimportance of politics in Neoplatonism. At the same time, against the Gnostics (whom he explicitly attacks), Plotinus also views emanation as natural in that it gives soul an opportunity to display its capacities by creating the universe in all its glory.

Porphyry (232 or 233-c. 305), Plotinus's most important student, was a Syrian from Tyre famous for the vast range of his learning. He spent some years with Plotinus in Rome, subsequently lived in Sicily, and

returned after his teacher's death to edit the *Enneads*. Porphyry's own extensive publications include a book against the Christians, who were now beginning to appear more dangerous. So far as Neoplatonism itself is concerned, Porphyry advanced a version of Platonism substantially that of Plotinus, though with special attention to the role of Aristotelian logic. At their overlapping points of contact, Plotinus's hypostases tended to be indistinguishable—the highest phase of soul, for example, being virtually identical with mind. Porphyry emphasized this implication of the system; and, especially in his treatment of soul's relation to mind, he ran the separate stages of emanation together in such a way as to reduce lower levels to mere appearances of the ultimate source. The practical consequence in ethics was further deprecation of immediate empirical reality. A letter Porphyry wrote to Marcella, whom he had married late in life, illustrates the tendency to ascetic detachment from everyday concerns with the material world and retreat into an inner spiritual life.

With Iamblichus (c. 250-325), another Syrian, a shift toward religious forms becomes intrusive, perhaps in part owing to the ever-growing threat posed by Christianity. At any rate, interest in tapping forces beyond the material world led to an incorporation of current occult practices and their rationalization under the label of theurgy. Greek oracles had already been used for similar purposes by Porphyry; and traditional gods, too, were now given places in the philosophic system by identifying them with the rapidly proliferating planes of emanation discovered by Iamblichus and his successors. The theoretical justification of magic which took its power from Neoplatonic metaphysics remained influential into the Renaissance and beyond. Iamblichus argued his position on this score most fully in *On the Mysteries*. To avoid deterministic implications of the material sympathy binding the universe together, he explained occult influences in terms of a nonspatial, nonmaterial reality (one, mind, soul) undergirding the physical world. In this reality everything is present to everything else, and so by exploiting its dimensionless affinities the philosopher could indeed perform "supernatural" operations. Owing to this efficacy, Iamblichus concluded that occult religious disciplines are superior to philosophic knowledge for attaining contact with divine reality. Since he had abandoned Plotinus's and Porphyry's doctrine that an aspect of

individual souls never descends from the higher realm, something more than purely rational means to achieve union with the gods seemed necessary. To this side of Iamblichus's thought belongs also a commentary on the *Chaldean Oracles*, along with much research on Pythagoras.

Iamblichus also made substantial technical contributions to Neoplatonism. He drew a cleaner distinction within mind between its objective, intelligible (*noeton*) facet answering to being; and its subjective, intellective (*noeron*) facet answering to thought. The former is prior to the latter, and so additional levels are introduced into the chain of reality. He further refined the process through which emanation itself occurs by distinguishing unparticipated, participated, and participating phases. The first is the highest, most unified aspect of any entity taken by itself; the second is its capacity to be a whole immanent in lower entities; the third is that immanence, making whatever participates in it to be what is. The triadic pattern, which was to be carried much further by Iamblichus's successors, had the effect of linking levels firmly together while at the same time increasing the complexity of the system. Iamblichus's scheme thus in general counteracts the tendency exemplified by Porphyry to telescope the hypostases.

The final phase of Neoplatonism came with the flowering of the school in Athens during the fifth century, when its scholastic side also reached a climax under Proclus (410 or 412–485), an immensely studious and prolific man totally devoted to a philosophy that had now become as much religious as speculative. Proclus saw his own work as an exposition of the perennial theology hidden in Plato, who in turn had derived it from Pythagoreans and Orphics. Proclus wrote hymns and engaged in religious discipline while producing commentaries of vast scope on Plato's *Republic*, *Timaeus*, *Parmenides*, and other dialogues, which took on the character of inspired sacred texts. In *The Elements of Theology* he reduced Neoplatonism to a set of crisp quasi-mathematical interlocking propositions, whereas in the *Platonic Theology* it is elaborated in utmost detail.

Proclus's system is an exceedingly complex pattern of reified relationships organized in triadic groups. At the top again is the "one"; then comes the dyad ("rwness"), a principle of multiplicity followed by

henads ("ones") representing the one at lower levels where it enters into relationships. Next is intelligible reality (mind) subdivided (following lamblichus) into intelligible, intelligible-intellective, and intellective planes, and finally the material world. To this are added various chains of gods, angels, daemons, and heroes along with different levels of soul beyond and within the universe. The countless junctures along the chains are formed by triadic links which multiply in geometric progression as emanation moves away from the one. Emanation itself obeys a fundamental three-phase law of remaining-proceeding-reverting. For Proclus philosophic thought and religious experience—often theurgic in nature—are finally identical with this cycle.

When the schools were closed in the sixth century by Justinian, Damascius—the last head—went to the Persian court for a time. With the triumph of Christianity the transformation of Neoplatonic thought into theology reached its completion. A crucial figure in the transition was the enigmatic Pseudo-Dionysius, an unknown Christian thinker (c. 500) remarkably at ease with Proclan ideas. The notion of visible, material symbols serving as means for reaching higher reality through theurgy was readily applicable to the sacramental, liturgical life of the church; and the triadic system of remaining-proceeding-reverting seemed to fit easily into a trinitarian scheme. Against the background of these two principles Pseudo-Dionysius worked out highly nuanced stages leading from what can be said about God on up to mystic union with him beyond knowledge and beyond either being or nonbeing.

The Platonism inherited by the Christian west was largely Neoplatonic. Its influence was strongest during the initial phase of medieval philosophy and receded only to a degree even later during the Aristotelian period. The tradition followed two principal routes: on the one side, Platonically colored theology of Christians such as Origen, the Cappadocians, or Augustine; on the other, writers, Christian or not, who preserved more exclusively pagan material (Victorinus, fourth century; Boethius, c. 480-525; Chalcidius and Macrobius, c. 400). Pseudo-Dionysius could be said to belong to both groups. The first major use of Neoplatonism in medieval thought was made by Eriugena in connection with the Carolingian revival during the ninth century. Borrowing directly from Pseudo-Dionysius, whom he had translated into Latin, Eriugena elaborated the distinction between positive and

negative theology in light of the key concept of procession and reversion, though not without some tendency toward monism or pantheism and some confusion between the biblical notion of free creation and automatic procession of divine substance. In the eleventh century, Anselm's ontological argument from grades of reality that necessarily entail and culminate in God had a generally Platonic structure; in the next century, Platonism was again of special importance for the so-called school of Chartres. In the fourteenth century, a more distinctively Neoplatonic relationship between the finite and the infinite, the immanent and the transcendent, was developed with great dialectic acuity by Nicolaus of Cusa; it then reappears during the fifteenth century in Italian Neoplatonism.

Neri Dei Visdomini

Neri (d. after 1282), of the Florentine family Visdomini, composed at least five *canzoni* (a possible sixth is ascribed in MS Vatican Latino 3793 to a "Neri"). Neri's poems concentrate on the mechanics of love and the problematic expression of the poet's desire, repeating his complaint that silent tolerance of love's cruelty cannot reveal the merits of his love. Two of his three laments (*L'animo è turbato* and *Oi lasso*) are composed because his heart, which can stand no more, forces him to "speak," indicting jealousy. *Oi forte inamoranza* and *Lo mio gioioso core* present conventional paradoxes of love (*dolze piaga facite*). All but *Per ciò che 'l cor* contain experiments in irresolute rhyme after *rimalmezzo*. Neri's language imitates courtly Sicilian tendencies while incorporating Tuscan forms, especially in equivocal rhyme—*m'ha porto* (syncopated participle): *porto* (from *Oi lasso*).

Niccolò Da Perugia

Little is known of the life of Niccolò (Sere Nichoiaus Prepositi, latter half of the fourteenth century) except that he was one of the middle generation of Italian musicians of the *ars nova*. His name appears in various forms; his surname presumes an origin in Perugia. It has been suggested that in Perugia, at the end of his life, he set a distinctly anti-Visconti text that was also set by his contemporary, Bartolino da Padova, whom he may have known personally. In our only hard datum, Niccolò is documented as visiting the monastery of Santa Trinita in Florence in 1362, along with Gherardello di Firenze. He has also been identified with a "Ser Niccolò" who was a singer of devotional *laude* in Florence in 1393. That identification is uncertain and highly speculative; but it is true that a number of Niccolò's Italian secular pieces were adapted with new texts for use as *laude*.

Niccolò's musical legacy is substantial. It consists entirely of Italian secular vocal pieces and survives extensively in the famous Squarcialupi Codex—which also contains his putative portrait—as well as in an important manuscript from Lucca. Niccolò's twenty-one surviving *ballate* are almost all composed not in the single-voice (monophonic) style that was then standard, but rather in two polyphonic voices, an innovation in which he was apparently the pioneer. However, many of these *ballate* are in a very simple, almost "popular" style: their subjects are often short moralizing themes, and

Niccolò particularly favored short, pithy refrain lines, also suggesting dialogue effects. There are sixteen madrigals, all but one for two voices; and four *cacce*, all for three voices. Those works are essentially in an established style, identified with the writing of the earlier masters Giovanni da Cascia and, especially, Jacopo da Bologna, except that several of the madrigals are, in effect, through-composed, with different music for each of the two stanzas—another example of Niccolò's experimentation.

For his texts, Niccolò drew heavily on the important poets of his day, such as Niccolò Soldanieri and Franco Sacchetti; and among his documented settings of Sacchetti's verses there were three *ballate* and two madrigals that are now lost.

Niccolò De' Rossi

The poet and jurist Niccolò de' Rossi (c. 1290—c. 1348) was a nobleman from Treviso. He earned a degree in law at the *studio* in Bologna in 1317 and obtained a teaching post in Treviso the following year; one of his competitors for the position was Cino da Pistoia, the eminent legal scholar and prominent *stilnovo* poet. Niccolò participated in municipal politics between 1320 and 1321, and he served as an ambassador of Treviso to Pope Benedict XII in 1339. He was a Guelf in the difficult days when the troops of the Ghibelline Cangrande della Scala, lord of Verona, carried out many raids in the *Marca trevigiana*. Treviso eventually succumbed to Cangrande in 1329. In 1339, Niccolò was nominated parish priest of the church of Saint Apollinare in Venice. He died in Venice, probably in 1348.

According to Brugnolo (1974, 13), Niccolò de' Rossi composed the

entire corpus of his poems between 1317 and 1328. This is a remarkable feat, considering that his is one of the most substantial collections of verse from the *Trecento* (441 poems, consisting of 436 sonnets and five *canzoni*). It is also the oldest collection of poems edited by an author to have come down to us. The most important and most complete manuscripts of Niccolo's poems are from the first half of the *Trecento*: Manuscript Colombino 7.1.32 (of the Biblioteca Capitulare in Seville) and Manuscript Vaticano Barberiniano Latino 3953 (of the Vatican Library), which also contains his anthology of *Duecento* poetry. (The Barberiniano manuscript is therefore an important primary source.) Niccolo deals with many themes in his *canzoniere*, although love is clearly the most prominent. In the first part of the collection the poet chronicles his relationship with Floruzza and reveals his affinities with the Sicilian, Tuscan and *stilnovo* schools of poetry. In several sonnets, such as 282 (*Segnor, guardàteve da miser Kane*) and 283 (*Che ce fa noi se dentro questa terra*), the poet speaks about political events. The correspondence between the numerical order of the poems in the collection and the chronology of political events that are occasionally mentioned underscores the autobiographical nature of the *canzoniere*.

Critics concur that Niccolò was a poet of limited talent. At the same time, however, they have come to appreciate his role as a mediator of the vernacular and of *Duecento* poetry in the Veneto. Indeed, Niccolò was one of the first poets outside Tuscany to recognize the linguistic importance of Dante and the *stilnovisti*.

Nicholas I, Pope

Pope Nicholas I (saint; c. 819 or 822-867, r. 858-867) had been influential in papal government under Benedict III as a learned deacon. Nicholas became pope in April 858 as the "imperial" candidate, perhaps facing some discontent among the Romans. Although Nicholas remained respectful of Emperor Louis II throughout his pontificate, his ecclesiological views, lucidly stated in his many long letters (much quoted by canonists in the High Middle Ages), brought him to several confrontations with Carolingian rulers. Supremely aware of the responsibility of popes to lead a united Christendom to salvation, Nicholas also battled particularism in the churches of Italy, France, and Byzantium.

In Rome Nicholas imposed himself on malcontents by employing them in prestigious embassies, by undertaking grand building projects, and by providing for the poor. Within the Patrimony Nicholas tolerated no insubordination; the refractory archbishop of Ravenna was deposed for uncanonical conduct (861). When Emperor Louis II took up the cause of Ravenna and marched on Rome, Nicholas's fortitude, the fasts and processions he organized, the diseases that struck the invaders, and the empress's mediation caused Louis to relent (864). Abandoning his clerical allies to their fate (deposition and imprisonment), Louis even agreed to restrict imperial involvement in papal elections (866).

The Frankish churches, no longer able to look to a pious emperor for leadership, were seeking a new order, as the *Pseudo-Isidoran* (or *False Decretals* of c. 850 reveal. Nicholas, who was probably uninfluenced by the *Decretals*, proposed his own solution: a united church, bride of

Christ, obedient to Rome, whose bishop would end secular tendencies in the Frankish clergy. Nicholas pursued this goal resolutely. The Lotharingian bishops, guilty of complying with their king's uncanonical divorce, were chastised. Hincmar of Rheims, leader of the Frankish clergy, was compelled to allow his suffragans to appeal to Rome, rightful head of the Christian community. (Appeals to Rome multiplied during Nicholas's pontificate.) Nicholas even redesigned the archdiocese of Cologne in the interests of the Scandinavian mission, which was backed by the papacy.

Nicholas, on canonical grounds, disapproved of Photius's elevation to the patriarchate of Constantinople by the Byzantine emperor (858), though in the Byzantine tradition it was legitimate. Nicholas also misunderstood the tensions within the Byzantine church, so lately embroiled in a dispute over icons. He demanded papal adjudication of the patriarchal case and won an important concession; papal legates condemned the previous patriarch, Ignatius (861). Seeking to retrieve papal jurisdiction over Illyricum and southern Italy, Nicholas overturned his legates's decision and condemned Photius (863), believing that Ignatius was more malleable. When the Bulgarian king, Boris, turned to Rome for advice on proper Christian comportment (866), Nicholas saw an opportunity to save souls, gain a toehold in Illyricum, and apply pressure to Byzantium. Ambassadors bore an exhaustive papal reply to Boris. However, the Byzantines perceived the papal mission to Bulgaria as an overt attack on their vital interests, and as an attempt to spread incorrect beliefs. In 867 Nicholas (not papal primacy or Latin Christianity) was condemned by a Constantinopolitan council. Nicholas died (in November 867) unaware of the "Photian schism."

For his upright character and lofty vision of the papacy's role in Christendom, Nicholas was considered a saint early on. He was listed in the *Martyrologium Romanum* in 1630.

Nicholas II, Pope

Pope Nicholas II (Gerard of Burgundy, c. 980-1061, r. 1059-1061) had been, before his election to the papacy, Bishop Gerard of Florence. He is numbered among the Lotharingian-Tuscan popes of the Gregorian reform because the houses of Lorraine and Canossa constituted his chief military support. Led by Hildebrand (later Pope Gregory VII) and Peter Damian, certain cardinals had agreed on Nicholas's election in

opposition to Benedict X, a member of the Tusculani family, who had been elevated as antipope by the Romans. Nicholas's official election was probably delayed to 6 December 1058 (feast day of Saint Nicholas) and took place in Siena, once the young king Henry IV had solemnly designated him.

Outstanding events of Nicholas's pontificate were an Easter synod of 1059, held at the Lateran; and the council of Melfi, held in August 1059, at which the Norman leaders Robert Guiscard and Richard of Capua became vassals of the Roman church. At the council of Melfi, Nicholas reversed the attitude of the papacy toward the Normans in southern Italy. He invested them with their earlier conquests, which were thus legitimized, and, moreover, also enfeoffed Robert Guiscard with territories that were still in the hands of the Byzantines or the Saracens. Robert's oath of fealty is still preserved in the canonical collection of *Deusdedit*. In it he promised to protect the papacy, to aid in future elections, to abstain from further attacks on the lands of Saint Peter, and to make regular census payments. The Lateran synod of 1059 is most famous for a decree that placed future papal elections in the hands of the cardinal bishops; this too was a reversal of earlier practices, which had allotted the preponderant share to the Roman clergy and people in general. Other important legislation prohibited simony, prohibited marriage for the clergy, instructed priests to lead the lives of regular canons, and—a quite revolutionary measure—ordered the faithful to boycott masses celebrated by unchaste priests.

Nicholas III, Pope

Pope Nicholas III (Giovanni Gaetano Orsini, c. 1225-1280, r. 1277-1280) was the son of Matteo Rosso Orsini, senator in 1244 and 1246. Nicholas had been created cardinal priest of Saint Nicholas in Carcere Tulliano in 1244 and succeeded John XXI as pope in 1277 after a vacancy of seven months, in the face of strongly voiced opposition from Charles of Anjou, then senator of Rome. Charles's term as senator expired in September 1278. Nicholas prevented its renewal and, in the bull *Fundamenta militantis Ecclesie*, specified that any emperor, king, prince, marquis, duke, or baron could become senator only with express permission from the pope, and never for more than one year; Romans could become senator without problems. Nicholas (as an Orsini) was then elected senator himself, but he exercised power through deputies, all Roman nobles.

Rudolf of Hapsburg was negotiating to come to Italy for his coronation when Nicholas became pope. Nicholas agreed to receive Rudolf in return for the cession of the Romagna to the papal state (1278). The province, influenced by the Ghibelline leader Guido da Montefeltro, proved difficult to pacify, despite conciliatory measures including a temporary recall of the exiled Ghibelline faction to Bologna. Nicholas finally requested help from Charles of Anjou but died before order was restored in the Romagna.

Ptolemy of Lucca accused Nicholas of aspiring to establish an Orsini kingdom based on the Romagna. This has been seen as either an attempt to counterbalance the Angevin power, which was encircling the papacy, or an Angevin fiction designed to bring Nicholas into disrepute. Probably it was neither: Charles manifested no intention of attacking the papal state. The coolness between him and Nicholas shown in his opposition to Nicholas's election, in the ending of Charles's tenure of the senate, and subsequently in the termination of Charles's papal

vicariate in Tuscany has been exaggerated, notably by Giovanni Villani. Although Charles probably distrusted the Orsini, he continued to receive support from the papacy in the south and sent support to the pope further north. Dante's story that Nicholas was persuaded by Byzantine gold, offered by John of Procida, to transfer Sicily from the Angevins to the Aragonese seems unfounded.

However, Dante justifiably denounced Nicholas for unprecedented nepotism. Nicholas created three Orsini cardinals. One nephew was papal vicar in the Romagna; another nephew was papal legate there; in Tuscany, a brother was senator twice; and so on.

Pope Nicholas III. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 216v.

Before his election Nicholas had been cardinal protector of the

Franciscans. As pope, he issued the bull *Exiit qui seminat*, which was based on the *Apologia pauperum* of Saint Bonaventura and was intended as a definitive statement on the problem of Franciscan poverty —on which it (unsuccessfully) forbade further discussion.

Nicholas began an artistic revival in Rome that was carried on by his successors. He extended and embellished Innocent III's palace on the Vatican, rebuilt the Sancta Sanctorum chapel (the only part of the medieval Lateran palace now surviving), and started improvements at Saint Peter's and Santa Maria in Aracoeli.

Nicholas IV, Pope

Pope Nicholas IV (Girolamo Masci, Jerome of Ascoh; 1227-1292, r. 1288-1292) had been general of the Franciscan order (1274), cardinal priest of Santa Pudenziana (1278), and cardinal bishop of Palestrina (c. 1280). He was active in the controversy between the Spiritual and Conventual Franciscans and in negotiating the union of 1274 between the Greek and Latin churches.

Soon after Nicholas's election, Charles II of Anjou was freed, in accordance with the treaty of Canfranc, from an Aragonese prison, on condition that he would promote peace between his captors and their enemies, the pope and Philip IV of France. Nicholas rejected the treaty, forbade Charles to send his eldest son as a hostage for its fulfilment, and, ignoring Charles's promises to Aragon, crowned him king in 1289.

In 1290, Ladislas, king of Hungary, died without issue. Nicholas then claimed Hungary as a fief of the Holy See and invested Charles Martel—eldest son of Charles II and Marie, Ladislas's sister—with it. This annoyed Rudolf of Hapsburg, king of the Romans, who wanted Hungary for his own son; and the Hungarians themselves, who elected a native prince, Andrew III. The upshot was a civil war that lasted until 1309, when Charles Martel's son Carobert finally emerged as the sole claimant.

In Rome Nicholas showed unwise favor to the Colonna family, provoking resentment that culminated in his having to flee to Rieti shortly before Charles II's coronation. Stefano Colonna, Nicholas's papal vicar in the Romagna, was defeated by the Polentani of Ravenna in 1290 and imprisoned—a disaster for the prestige of the papacy. Its prestige was further damaged by concessions to the college of cardinals,

notably the bull *Caelestis altitudo* which granted the college a half share of all temporal revenues from papal lands.

The fall of Acre to the Mameluk sultan of Egypt in 1291 was the main disaster of Nicholas's reign. He provided some ships for an expedition to recover it but died before seeing how futile his efforts were. His attempts to convert pagans were not much more successful, though he was responsible for sending John of Monte Corvino on a famous mission to the China of Kublai Khan.

Nicholas IV encouraged the Inquisition and increased the number of inquisitors. He continued Nicholas III's building program in Rome: in particular, he built a palace next to the church of Santa Maria Maggiore and restored the church itself (though Torriti's famous apse mosaics showing Nicholas and Cardinal Giacomo Colonna side by side were paid for by the latter). As a Franciscan and theologian (he wrote a number of treatises), Nicholas had some reputation for holiness, but his pontificate was marred by his uncompromising repudiation of the treaty of Canfranc, his favoritism to the Colonna, and his arrogance in dealing with Hungary.

Nicolaism

"Nicolaism" is a derogatory term for the practice of the higher clergy whereby they had wives or concubines. The word *nicolaita* was used in the eleventh century by church reformers as part of a campaign to enforce celibacy on bishops, priests, deacons, and subdeacons. Its earliest use during the eleventh century may be in Cardinal Humbert of Silva Candida's *Contra Nicetam* (1054), directed against the marriage of the Byzantine clergy. Pope Nicholas II, in his Roman synod (1059), condemned "the heresy of the Nicolaites, that is, married priests, deacons and all others in the clergy" (*Patrologia Latina*, 143.1314B).

The reformers adopted the word *nicolaita* from the Book of

Revelation, in which Jesus praises the Ephesian Christians because "you loathe as I do what the Nicolaitans are doing" (Revelation 2:6) and criticized the Christians of Pergamum because "among you, too, there are some as bad who accept what the Nicolaitans teach" (Revelation 2:14-16). From the context of Revelation, it appears that the Nicolaitans had lax teachings on sexual practices and the eating of food offered to idols. Some early Christian heresiologists, including Irenaeus, Hippolytus, and Epiphanius, identified them as followers of Nicholas of Antioch, mentioned in Acts 6:5, whom they accused of teaching a form of gnostic sexual licentiousness.

There is no historical link between the early Christian gnostic libertines and the married clergy of the eleventh century. The reformers used the biblical word in order to strengthen their polemic in favor of clerical celibacy.

Nilus of Rossano

Nilus of Rossano (Neilos, c. 910-1004) is perhaps the best-known representative of Greek monasticism in medieval Italy before the Great Schism. The chief source for his biography is an anonymous eleventh-century *Life of Saint Nilus the Younger*, an impressive document of

Italo-Greek monastic ideals; despite the exemplary import of the incidents chosen for narration, it seems in outline to be factually accurate. According to this account, Nilus was born to an aristocratic family in Rossano, an important eastern Roman (Byzantine) administrative center in eastern Calabria, received a good religious education, and was orphaned at an early age. At the age of thirty, he abandoned the world (he had sired a daughter, perhaps out of wedlock) for an ascetic life in the mountainous border region of the Mercurion and there came under the influence of Fantinus the Younger and other holy fathers. To evade a gubernatorial ban on his becoming a monk, he took the habit at a Greek monastery in the Lombard principality of Salerno. Nilus then returned to Fantinus's lavra (colony of anchorites). Living first there and then in a nearby cave, he learned and later taught calligraphy. During this time he also traveled to Rome to visit the tombs of the apostles and to consult books whose identity, regrettably, is unknown.

Arab raids caused Nilus to retreat in the late 940s to one of his properties near Rossano, where together with some of his students he founded a monastery of his own. He resided here as a penitent for the next quarter-century, achieving more than local repute as a holy man and miracle worker. He is said to have declined being named bishop of Rossano and to have obtained from the emir of Palermo the liberation of three of his monks who had been captured and enslaved. Around 980, fleeing further Arab incursions and his own growing fame, Nilus and his comrades left the eastern empire for good and were welcomed in the Latin west by the Lombard prince of Capua, Pandulf Ironhead. At the behest of Pandulf's successor Landulf IV, Abbot Aligern of Monte Cassino installed them in 981 at the abbey's daughter house at Vallelucio (now Valleluce), where they participated to a limited extent in the life of the neighboring Benedictine community. Here Nilus composed an office for Saint Benedict and probably some of his other poetry.

After Aligern's death, relations between the two groups soured, and in 994 or 995 Nilus founded a new monastery at tiny Serpen (now Serapo) in the duchy of Gaeta. From here he made journeys to Rome, where he failed to persuade his fellow Rossanese, John Philagathus, to renounce the papacy he had assumed in 997 after the ouster from the

city of the imperially selected incumbent, Gregory V; and where, too, after John had been deposed and later blinded, Nilus attempted in an interview with the emperor Otto III to have the former antipope released to his custody. In 1004, the aged Nilus left Serperi and, staying at a small Greek monastery in the Aiban hills not far from Rome, obtained land for a new foundation from Gregory I, count of Tusculum. Nilus died there shortly after his monks had arrived at the nearby site and begun work on what would become the famous Greek abbey of Grottaferrata.

Nilus's surviving verse, all in his native Greek, is not a large body of work. Specimens of his scribal work and that of his students also survive, however. His correspondence does not survive, apart from brief summaries and extracts (mostly in the *Life*, a partly eyewitness account sometimes ascribed to his companion and successor Bartholomew of Grottaferrata). To Nilus himself has been ascribed, on very slender grounds, the commentary of Nilus the Monk on the *Perí stáseon* (*On Issues*) of the ancient Greek rhetorician Hermogenes.

Nobility

Nobilitas, or *nobiltà* ("nobility"), is a term denoting high social, political, and economic position within medieval Italian society. Beyond this thin definition, the term defies simple framing. Writers from Cassiodorus to the compilers of communal statutes to early Renaissance humanists to modern scholars have reflected the many-sided nature of nobility and the continuing debate over its characteristics. In general these characteristics included control of land and wealth on a scale greater than that of lay non-nobles; some political, judicial, and economic power over those on the land the nobles controlled, or within the polity to which they were subject, or both; personal or familial heritage that included service to an overlord or state; a military function (usually as cavalry); high social status with legal privileges beyond those of commoners; and the heritability of all this. Nonetheless, there are well-known exceptions to each characteristic

over the course of medieval Italian history.

The term "nobility" is derived from the Latin *nobilitas*, which, in the later Republic, referred to an upper class of Roman senatorial families of both patrician and plebeian origin. This held true into the empire. Since nobility was also tied to office-holding, as the demand for civil and military officers grew in the fourth century, the number and complexity of levels within the noble class of *clarissimi* increased, as did mobility into it. As a result, by the end of the western empire the meaning of *nobilitas* had become vague. Cassiodorus claimed in one place that nobility applied only to full senatorial families, but in another he stated that it was a matter of ancestral wealth or native genius. Boethius attributed nobility to good birth and inherited morality, but not necessarily wealth. Late classical nobility was conceptually fluid, but it was generally characterized by ownership of land, antiquity of family status, and office-holding. Nobles tended to control local ecclesiastical and political patronage, though they eschewed ecclesiastical office. Nobles in northern Italy during the late Roman period usually centered their activities on the cities, especially on Rome and its senate, and their control of the countryside weakened. Southern nobles retained stronger rural bases, and those who survived the Gothic wars shifted their allegiance to Byzantium before being overrun by the Lombards.

Under the rule of the Ostrogoths, the northern Roman nobles had to share their property (fifty-fifty, a practice known as *hospitality*) and status with the barbarian warriors, who took over military affairs but complemented the Romans in most others. Ostrogothic society had long been socially stratified under leaders noted for their fine dress, their armor and weapons, and their thirst for land. Often they augmented their share of land from *hospitality* by purchasing more, further eroding the economic base of the Roman aristocracy. Though King Theodoric kept his Gothic nobility under control, his successors were unsuccessful; and Justinian's Gothic wars devastated the western Roman and the Ostrogothic aristocracy.

The Lombard invasions, beginning in 568, nearly obliterated the Italian nobility as the warriors seized what they could and destroyed the rest. Both Goths and Romans fled or were massacred, and the land was divided by the kings among the new territorial lords. The Lombard

nobility was thus landed, military in function, and usually characterized by ties of clientship to the royal court. The Lombard laws prove to be of little help in defining the Lombard nobility, since "noble" and "freeman" are often used interchangeably. Except in the Apennines, Lombard nobles tended to settle in or near towns, which were usually governed by dukes (*duces*), who provided their own patronage. This no doubt reinforced the urban nature of northern Italian society and sustained southern seaports like Amalfi, Salerno, and Naples. Nonetheless, as the fabric and society of the northern towns decayed, the Lombard nobility, along with many commoners, established themselves in the countryside. Although, or perhaps because, they practiced partible inheritance, lordship over Lombard properties was held collectively by all brothers in a family, an arrangement known as a *fraterna* or *consorzio*.

The impact of the Carolingian conquest on the Italian nobility was minimal, as Frankish colonization was limited to a few cities such as Asti and Piacenza and the region between Pavia and Verona. Franks held positions of authority under the king, but they rarely dispossessed Lombards of their land. In addition, the later Carolingians often placed old Lombard families back in positions of local power as vassals or clients with huge estates. The *fraterna* system proved enduring as noble families consolidated local power bases, first in the countryside and then in the slowly reviving cities. Rural clans controlled both ecclesiastical and secular fiefs, and sometimes formed rural communes of many families, or branches of families, who drew up statutes, met in an assembly, and elected a leader or *podestà*. In the late and post-Carolingian anarchy, nobles served a wide range of lay and ecclesiastical administrative and especially military functions, usually with only rudimentary central coordination. Bishops often replaced counts as territorial lords, and church lands were often handed over as benefices to powerful laymen. These *capitanei* further enfeoffed *valvassores*, who in turn took on knights (*milites*) as vassals as northern Italy underwent feudalization.

During the later tenth century, as urban life redeveloped in northern Italy, markets for the goods of noble estates and opportunities in the increasingly powerful church drew many members of noble families to towns. Others, who were defeated in their bids to resist the new urban

centers, were forced to swear allegiance to the dominant town, build a townhouse and live there several months of each year, pay tribute to the magistrates, serve in the town's militia, and not obstruct commercial traffic. While no single pattern or model is valid for all areas, in general the nobles retained their rural ties, both social and economic, and their clan identities after settling in towns. Unlike the nobility elsewhere in Europe, Italian nobles of the High Middle Ages generally accepted commercial activities as legitimate for members of their class, and by the later thirteenth century only a relatively few noble families disdained trade. It appears that nobles, with their martial traditions, were leaders in most of the urban revolts against episcopal and ducal power that established the communes. In the early communal period, nobles usually served in the highest offices and took much of the responsibility for defense. Representation in public matters was often by family or clan, later replaced by the more class-neutral guilds. Urban nobles constituted a privileged class in early communal Italy.

Clan members tended to be located in the same urban neighborhoods, and they created enclaves around great tower structures, which often had to be defended from rivals or from the commune itself. "Tower societies" (*consorteria*) that emerged between 1160 and 1260 were collections of male family members and allies who saw their interests as tied to those of the clan. Their houses physically surrounded the stronghold, as those of vassals and retainers did in the *contado* (countryside). In the later thirteenth century and the early fourteenth century, these enclaves were broken up and the towers were truncated, either by political rivals or by the commune. Nonetheless, coats of arms continued to mark the range of influence of the noble families and decorated houses and walls, chapels and church plate, banners, books, and armor. The trappings as well as the status of the noble lifestyle attracted rich urban parvenus, who built and acted like the older seigneurial nobles, adopted coats of arms, took over patronal roles in the secular and ecclesiastical life of the towns, and married into noble families. Frederick I Barbarossa had been forced to give Lombard cities the power of lordship, and during the thirteenth century it was not unusual for towns to create knights for military service and thus "ennoble" them. As early as 1173, Genoa knighted more than 100 men,

and in 1211 it knighted 200 more.

With the rise of the *popolo*, city governments often reacted harshly against nobles because the noble lifestyle often resulted in a disruption of normal civil life. Tension developed between old and new nobility, but by the later thirteenth century communal governments often lumped the two together, and lumped both with some rich *popolani*, for the purposes of so-called anti-magnate legislation, which strictly curtailed most of the special privileges and even some basic rights of the rich and powerful and violent. Economic stresses, pressure from the upwardly mobile *borghesi*, competition for communal magistracies, old rivalries, and simple restlessness often led to conflict between families and their gangs of retainers. Competition for the papacy was an impetus for feuding between the Roman Crescentii (Crescenzi) and Tuscolani families from 940 to 1050, and later between the Orsim and Colonna. "Insults, assassinations or wounds, affronts to blood and honor, and even petty jealousies thus incited deep hatreds between families or rival branches of the same house. Inimical groups grew into opposed political factions" (Heers 1977, 106). In Florence, the Cerchi and Donati; in Siena, the Tolomei and Salimbeni, and the Malavolti and Piccolomini; in Bologna, the Lambertazzi and Geremei; and in Pistoia, two branches of the Cancellieri battled one another and often involved large sectors of the city and *contado*. *Popolani* and nobles (*magnati*) also clashed in the streets—for example, in Piacenza in 1219, 1221, 1223, 1225, 1232, 1233, 1234, and 1235. By the end of the century in most northern Italian cities, however, the *popolani* had gotten the upper hand.

With a devaluation of the nobles themselves through legislation, destruction of towers, ennoblement of *popolani*, miscegenation, and exile, by the later thirteenth century the conceptualization of nobility began to shift away from lineage and martial prowess toward a morally determining element that was found not in the clan or family but in the heart of the individual. Dante bemoaned the extinction of many great families, and foreign observers belittled the urbanized nobles as unworthy of true chivalry. Indeed, Italian nobles began to ape their French counterparts by cultivating a chivalric culture of court life, romances, and even jousting. Nonetheless, a world in which Lapo da Castiglionchio could claim that a noble is simply "anyone whom a

prince or people accept as such" needed a redefinition of nobility. Bartolo the jurist conservatively vested nobility in heredity, but Dante and other *stilnovisti* poets ascribed nobility to the man with virtue: the noble man ennobles his family, not vice versa; nobility is planted by God and cultivated by the individual of merit. The argument would continue into the Renaissance.

The Venetian nobility evolved in a manner independent of many of these concerns. From early on, the aristocratic families were urban, involved in maritime commerce and warfare, and detached from the land. The *serrata* of 1297—a definitive listing of those who could serve on the grand council—closed the ranks of the nobility. Early in the fifteenth century Venice began to expand on the mainland, creating new opportunities for Renaissance noble resources and leadership.

Rural southern Italy before the Norman conquest was dominated by clans of Lombard *maiores* who controlled villages and agriculture, owed allegiance to more or less powerful urban counts and dukes, and had strong social and commercial ties to seaports such as Amalfi and Salerno. The Byzantines' control was fitful and normally required payment of taxes and tribute by existing landlords. The Arabs' influence was insignificant. The Normans' conquest and their introduction of northern feudalism slowly replaced the existing local nobility with northern Europeans whom the kings tried to keep on a short leash, later in part by the development of a magnetic court life in Naples.

Sicily had been lost by Rome to the Vandals after 440, reconquered by Justinian, and lost again to Muslim invaders beginning in 827. Muslim landlords constituted a rather weak nobility that feuded constantly and practiced partible inheritance. Nonetheless, the Normans took thirty years to subjugate Sicily and impose northern feudalism along with Norman, Lombard, and French vassals as new landlords. These practiced both partible inheritance and primogeniture and held the land as restricted fiefs rather than freeholds. The monarchy's use of crown officials and a professional military contingent helped to keep the nobility weak. In the later twelfth century, baronial uprisings were put down, but they resulted in a short-lived reinforcement of the elective principal of kingship.

Hohenstaufen rule introduced to Sicily many new German barons who seized land and upset the old noble order. Under Frederick II (d.

1250) nobles played important administrative and political roles, but they ignored commerce, which was quickly dominated by Italian city-states. Angevin rule (1268-1282) substituted French vassals for many local nobles, leading to feuding between the Hohenstaufen and the Angevins in the wake of the Sicilian Vespers. Intervention by the Aragonese added new Spanish nobles to the mix. From this political turmoil emerged a new feudalization in which matters of blood and social ties, honor, and a warrior ethic fueled ninety years of internal war during the fourteenth century. Beginning in the 1390s, powerful Aragonese harnessed one faction, destroyed the other, and established a firm grip over the traditionally unruly Sicilian nobility.

Nonantola

The monastery of Nonantola (dedicated to All Saints and Saint Silvestro) is in the region of Emilia, not far from Modena. It was founded during the Lombard period—exactly when is not known, but it was definitely organized by 753, when the Lombard king Aistulf bestowed it on Anselm, duke of Friuli, who then retired to the religious

life as abbot of the monastery. Nonantola was the beneficiary of numerous gifts from Aistulf, but it received little royal attention during the reign of the next king, Desiderius. Anselm may have been exiled for a time to Monte Cassino, whence he returned with manuscripts that became the foundation of Nonantola's famous monastic library. Following the Frankish conquest, the monastery enjoyed favor again, and it was extremely wealthy in the ninth century.

Nonantola's growth was abruptly halted in 899, when the Hungarians burned the monastery and destroyed many of its charters and manuscripts. The monastery was rebuilt in the tenth century, reclaimed its former lands, and received occasional grants from the later Italian and German rulers of Italy. It was beginning to lose much of its old independence, however, and was becoming more and more enmeshed in feudal entanglements. These entanglements caused it for a time to be part of the feudal domain of the bishop of Modena, then later of the bishop of Parma, and finally, in the early fourteenth century, brought it into the hands of the d'Este family, where it would remain for some time.

The abbey was organized according to the Benedictine rule from the time of its founding until 1514, when it became a Cistercian monastery. It was dissolved in the late eighteenth century, briefly restored in the nineteenth century, secularized again in the late nineteenth century, and again restored in the twentieth. Today, the monastery at Nonantola is still a place of considerable interest for its Romanesque and pre-Romanesque buildings as well as for the archives—mostly charters—that are preserved there.

Nonantola was an important monastic center not only because of its wide holdings, which included scattered possessions throughout much of northern Italy and beyond, but also because of the scriptorium and music center that developed there. The scriptorium was important in the copying of manuscripts; it also provided the means whereby the charters of the monastery were restored following destruction by the Hungarians and later by fire. The monks proved adept not only in recreating a number of the documents that had been lost but also in creating a number of new ones to justify real or imaginary monastic claims.

Nonantola's buildings are important architecturally and artistically,

especially those sections that survive from an early twelfth-century rebuilding, work either done by or influenced by the Lombard Romanesque master builder Lanfranco and the sculptor Guglielmo (Wiligelmus).

Normans

In addition to their famous conquest of England in 1066, the Normans also established a kingdom in southern Italy in the eleventh and twelfth centuries. Until relatively recently, the kingdom of southern Italy and Sicily (also known as the Regno) was little studied by Anglo-American scholars, but it was one of the most dramatic examples of cultural intersection and "state-building" in the Mediterranean during the medieval period.

As early as c. 1000, the region from the Abruzzi southward through

Sicily (including Molise, Campania, Apulia, and Calabria) was remarkable for its interplay of Greek, Latin, Jewish, and Muslim cultures. In the early decades of the eleventh century, another piece was added to this cultural mosaic when small bands of Norman soldiers, mercenaries, and pilgrims settled in the south. The descendants of these Normans united the territories south of Rome to create the Regno, a political unit that some scholars have rather rashly called the "first modern state." Unlike the Normans who conquered England under the leadership of Duke William (the Conqueror), those in southern Italy and Sicily settled in a piecemeal fashion. They perhaps appeared first in the late tenth century, and they were still immigrating in the 1080s and 1090s. The Normans gradually insinuated themselves into the highest levels of southern Italian society through military prowess and clever intermarriage. Because of their small numbers, they could not attempt a full-scale "Normanization" of the south. Rather, they assimilated and adapted, thus preserving the religious, linguistic, political, and social diversity of the south.

The sources do not agree about why the first Normans came to the south. According to one account, Pope Benedict VIII (r. 1012–1034) enlisted Norman mercenaries to aid Meles of Bari, a Lombard, in defeating Byzantine forces in southern Italy. Another account suggests that Norman pilgrims, on their way home from the Holy Land, encountered Meles and entered his employ. According to another narrative, a small group of brave Normans, returning from a pilgrimage, arrived in Salerno and helped defeat thousands of Saracens. Despite the enticements of this land of "milk and honey," these Normans returned to their homeland; nevertheless, their tales of riches and exotic novelties no doubt persuaded others to go south to seek fortune and adventure.

Once in southern Italy, the Normans quickly gained a reputation for being ruthless and predatory. Charters of the early period sometimes mention widows and orphaned children forced to sell whatever remained of their belongings after a vicious Norman attack. Normans in the south quickly transformed themselves from mercenaries to political and military leaders with the establishment of the first Norman principality at Aversa, just north of Naples, in 1030. The territory was a gift from the duke of Naples to Rainulf the Norman for his service

against a Lombard prince, Pandulf of Capua. The 1030s and 1040s saw the arrival of more Normans, most significantly the younger sons of Tancred of Hauteville—a minor Norman lord—who went south to seek their fortunes. According to one chronicler, "no member of the house of Hauteville ever saw a neighbor's lands without wanting them for himself."

Foremost among the sons of Hauteville was Robert Guiscard, or "the cunning." Tall, blond, ruddy, and tyrannical, Robert Guiscard arrived in 1047. Together with his half brother, Roger (sometimes called great Count Roger), he launched a campaign in 1061 to conquer Sicily. Robert Guiscard came to control much of Apulia, Calabria, and Campania. Politically practical, Guiscard repudiated his Norman wife, Alberada, on the grounds of suddenly acknowledged consanguinity, to marry Sichelgaita, the sister of the Lombard prince of Salerno. However, as the Normans accumulated territorial possessions in the south, they did not "conquer" or "invade" the peninsula with a predetermined plan to create a kingdom.

Robert Guiscard and the Normans contended not only with Lombards, Muslims, and Greeks during the eleventh century. Coincident with this period of Norman expansion were the reform efforts of the eleventh-century papacy, often called the Gregorian reform movement after Pope Gregory VII. As early as the mid-eleventh century, the papacy grew concerned about the spread of the Normans' power in the south. In 1053, Pope Leo IX led a papal army of Germans and northern Italians against the Normans at Benevento. The Normans defeated the papal forces at the battle of Civitate and took Leo IX prisoner during the clash. Following this setback, the papacy pursued a different strategy in dealing with the Normans: in 1059, Pope Nicholas II recognized Richard the Norman and Robert Guiscard as vassals of Saint Peter. Richard became the prince of Capua, and Robert was named duke of Apulia and Calabria and future duke of Sicily. The pope thus granted legitimacy to the Normans' domination of the south; in return, the Normans pledged to support and to defend the possessions of Saint Peter. The papacy benefited from the diversion of the Normans' attentions away from Rome and toward Bari (conquered in 1071), Salerno (1076-1077), and Sicily (1091). In addition, the Normans helped the papacy to check the Byzantines' and Muslims' expansion in

southern Italy and in Sicily. The agreement between the papacy and the Normans did not prevent Gregory VII from forming an alliance with Prince Robert of Capua in 1074 against Robert Guiscard. Guiscard, however, came to the aid of Gregory VII a decade later: when Emperor Henry IV lay siege to Rome in 1085, Guiscard rushed to Rome from his own siege at Durazzo to rescue the pope from Castel Sant'Angelo, where he had barricaded himself. The Normans inflicted the worst sack of Rome since the fifth century as Gregory escaped with Robert Guiscard to Salerno. The pope died in Salerno later that year.

The Normans contributed to the Latin church in southern Italy in other ways as well. They established new monasteries, supported older foundations such as Monte Cassino and La Cava, and were influential in the selection of bishops—despite the papacy's opposition to lay investiture. In spite of the Normans' support for Latin Christendom, Muslim and Jewish communities survived, owing to the political necessity of religious tolerance.

By the end of the eleventh century, most of the Mezzogiorno (southern Italy) was in Norman hands. Power, however, was largely decentralized. No evidence suggests that the idea of a unified kingdom had yet taken shape. Indeed, several Norman rulers controlled various regions in the period following Robert Guiscard's death. Of Guiscard's two sons, the younger, Roger, also called Borsa, son of Sichelgaita, was the favored heir. He became duke of Apulia and was succeeded by his son William of Apulia (r. 1111-1127). The elder, Bohemond, son of Alberada, though initially overlooked, was named prince of Taranto and later became involved in the crusades. Capua, meanwhile, remained independent, under the control of Prince Richard's heirs. Finally, Roger I, Guiscard's brother, having completed the conquest of Sicily in 1091, ruled the island and was succeeded in 1101 by his young son, Roger II, who ultimately shaped the future of the Norman kingdom in the south.

Roger II reached his majority and ended his mother Adelaide's regency in 1112. By 1127, Roger had acquired the principality of Capua from Robert of Capua by force and the duchy of Apulia through a contentious inheritance claim. On Christmas day 1130, in the cathedral of Palermo, Roger was crowned king of Sicily by a representative of the antipope, Anacletus II. Because this was a time of schism, Roger's royal

title did not become official until it was recognized in 1139 by Pope Innocent II in the treaty of Mignano. His full title became Roger, king of Sicily, duke of Apulia, and Prince of Capua.

Roger II's titles reflect the character and strategy of his rule. As king of Sicily, he was not "king of Italy," because other powers laid claim to Italy. The German emperor considered himself the ruler of the *regnum Italicum*. Moreover, Roger was king of the territory that the pope had commissioned his ancestors to subjugate decades earlier. As prince of Capua and duke of Apulia (the Duchy of Apulia by now consisted of the Principality of Salerno), Roger acknowledged that he held those lands as a vassal of the church. Roger's titles also reflect the ethnic and religious diversity of his territories. Roger recognized his limitations: practicality and geography did not permit him to be an "absolute" ruler. His authority rested on a recognition of the traditions and practices of the people he ruled. The Duchy of Apulia and the Principality of Capua continued to exist, though they were part of the Regno.

Roger's laws, like his titles, reflect the variety of influences and customs that characterized his state. The preamble to a law code attributed to Roger reads: "We order that the laws newly promulgated . . . should be fully observed by all. Because of the variety of different people subject to our rule, the usages, customs and laws which have existed among them up to now are not abrogated unless what is observed in them is clearly in contradiction to our edicts here." Roger was clear: his state was an amalgam of many peoples whose customs he would continue to tolerate, so long as they did not contradict the royal will.

Roger died in 1154, having earlier appointed his son William I (r. 1154–1166) as his successor. William I—called "the Bad," though Loud (1999) suggests that "the Unlucky" might be more appropriate—and his son William II, "the Good" (r. 1166–1189), sustained the tradition of strong monarchical government established by Roger II. The power of the monarchy diminished during their reigns, however, perhaps because they lacked Roger's personal charisma and political skill. An unsuccessful coup attempted against William I in 1161 and the anarchy incited by his chief minister, Maio of Bari, exposed undercurrents of discontent among top officials and barons. William II made efforts to appease his barons, especially those on the mainland. His true legacy

was a marriage he negotiated in 1184 between Roger II's daughter Constance (William's aunt and only heir) and Henry (later Emperor Henry VI, r. 1194–1197), the son of his great rival, the Holy Roman emperor Frederick I Barbarossa. The relationship between the empire and the Regno was complex: on the one hand the Sicilian monarchs were seen as usurpers of imperial sovereignty, but on the other hand they were bound together through marriage.

Following William II's death, there was a struggle between the supporters of his chosen heir, Constance, and his illegitimate son, Tancred of Lecce. Tancred ruled the kingdom until his own death in 1194, at which point Henry VI assumed the title he acquired through marriage, king of southern Italy and Sicily—a title long desired by his German forebears. The dynasty that originated with the Normans produced a new heir: Frederick Roger, later King Frederick II, called *Stupor Mundi*. Frederick II would inaugurate a new kingdom that rested on foundations created by his Norman ancestors.

Historians of the medieval Mezzogiorno debate the extent to which the Regno actually reflected the mixture of cultures it contained. How to characterize the monarchy—was it "absolute" or "composite," "Byzantine" or "western"?—is frequently discussed. Roger II and his successors had extensive contacts with or knowledge of the Holy Land, Egypt, and Byzantium. They also knew something of their Norman heritage, and possibly had notions of feudal relationships and the evolving feudal monarchy in England. The king of southern Italy and Sicily, in theory, was the ultimate feudal lord in the kingdom. All lands were held ultimately by the king. The *Catalogus baronum* (*Register of the Barons*, c. 1150) offers an accounting of the kingdom's wealth for Apulia and Capua and lists the obligations of the king's vassals. This document clearly supports the image of an absolute feudal king. Furthermore, the crown tightly controlled its natural resources (including grain, salt, steel, pitch, and wood) and small industry (the renowned silk production in Palermo). Some products had military value; others contributed to the splendor of the royal court. An intriguing aspect of Norman kingship is the management of the southern Italian economy. Commercial activity, however, was not as developed as might be expected, given the promise and potential of resources and seaports. In the pre-Norman period, cities such as Amalfi

and Bari had been prosperous commercial centers. During the Norman period, commercial privileges were increasingly granted to northern Italian cities.

Kingship in twelfth-century southern Italy, however absolute, was strongly supported by a permanent administration and royal court at Palermo. This underclass of officials who oversaw the complex running of the kingdom reveals a medley of cultural influences. The titles of officials at court—*emirs*, *justiciarii*, *strategoi*—reflect the Muslim, Latin, and Greek institutions in the Norman kingdom. A French-style chancery issued documents in Greek, Arabic, and Latin. Many of the laws owed their origin to Justinian. Roger II's kingdom was so different from anything else in Europe at the time that scholars studying the iconography of the royal chapel and Martorana in Palermo have argued for both Byzantine and Ottoman influences. Roger II's court had a harem; William I's palace included a zoo with exotic animals. The most obvious example of cultural intersection is found in the art and architecture of the Regno. Churches with Arab workmanship and Latin architecture were spectacularly adorned with mosaics in the Greek style. Magnificent examples include the cathedrals at Monreale and Cefalu and the Palatine Chapel in Palermo. A mosaic in the Martorana in Palermo is one of the most famous images of absolute, divine-right kingship. In this mosaic, Christ crowns King Roger II, and the facial similarity between the two figures is unmistakable.

Recent scholars urge restraint in giving the Normans credit for discovering the secret of the "modern state" through their seemingly forward-thinking approach to multicultural rule. Perhaps ironically, a mosaic might be the best metaphor for the Regno, acknowledging the variety of influences in the Norman kingdom but connoting separation and coexistence, rather than a fusion or a *mélange*. The terms "united" and "homogeneous" are currently giving way to "heterogeneous" as scholars recognize the Normans' achievement but suggest that its origins lay in the necessity and expediency involved in managing diverse peoples. Moreover, current discussions of the Mezzogiorno during the medieval period focus on the articulation of local powers (family, governance, ecclesiastical) against the backdrop of the Norman kingdom. The extent of practical governmental authority—especially on the mainland—is a fruitful topic for future research.

The sources and essential critical studies on southern Italian medieval history are not always easy to access, and they represent many different languages. The general studies by Norwich (1967, 1970) and Matthew (1992), in English, are a good place to start. For current bibliography see Matthew (1992), Loud and Wiedemann's edition (1998) of Falcandus, and Abulafia (1977, 1987, 1989). The sources listed below represent a sampling of the major works to which scholars refer in various languages, but English-language studies are emphasized.

Notaries

In medieval Italian society, the notary served vital functions in both public and private life. Usually invested with authority ultimately

derived from the emperor, he served popes, bishops, monasteries, the emperor, kings, princes, civic governments, courts, and offices, and the needs of common citizens. The notary composed official correspondence, recorded deliberations and decisions, and drew up the documents that these generated. Often the only literate member of local society, the notary recorded private transactions such as contracts, deeds, donations, and wills. The notaries' guilds, usually organized with lawyers and judges, were among the earliest and most powerful in northern and central Italian cities. Notaries were crucial in the transmission of Roman law after its revival and were instrumental in establishing civic archives and early chronicles. With their access to official papers, they were pioneers in creating document-based secular histories; and their literary interests, with roots in classical Roman culture, spurred developments in both medieval and Renaissance humanism. Steinhoff has noted, "Excluding the profession of the sword, that of the notary was among the earliest, the most self-conscious and certainly the largest in the medieval world" (1976, 1).

The medieval Italian notary was the direct descendant of the later imperial Roman *notarius*, *exceptor*, and *tabellio*. Earlier, scribes (*scribae*) acted as court recorders and copyists of private and official acts, while the *notarius* took raw notes (*notae*) of proceedings in a kind of shorthand. By the fourth century, *notarius* was a label attached to secretaries in the imperial service. The *exceptor* had emerged as the official clerk attached to all bureaus and courts and required at all municipal meetings of *curiae*, whereas *tabelliones* handled private matters such as wills and contracts without holding any public office. Apparently both *exceptors* and *tabelliones* were organized into civic guilds (*collegia*, *scholae*), headed by *aprimicerius*, to ensure the official recording of both public and private acts. Though the *tabellio* was generally of lower social status, his was a position with potentially high mobility; and the official positions often drew young nobles.

The earliest known regulation of the acts of *tabelliones* was in the forty-fourth and seventy-seventh *novellae* of Emperor Justinian's law code (*Corpus juris civilis*, 536–538). These required the actual presence of the *tabellio* as a witness to the proceedings, as well as the recording of the names of other witnesses, dating by regnal and consular year and indiction, inclusion of a *completio* in which the *tabellio* claimed

responsibility for the document, and signatures by witnesses. These requirements were soon ignored in the non-Byzantine western empire, but they were resurrected and reapplied along with much of the rest of Justinian's code in the eleventh century.

In the early Christian church, notaries served bishops and monasteries and were important as correspondents in the doctrinal battles of the third and fourth centuries. Constantine himself created *scholae* of notaries under *primicerii* for bishops and their courts. In Rome, perhaps as early as the first century, seven subdeacons were chosen "faithfully to collect the deeds of the martyrs," according to *Liber pontificalis*. Pope Gregory I (r. 590-604) organized papal *notarii* or *scrmarii* into a *schola*; Gregory's registers demonstrate that they were responsible for recording correspondence, ordinations, privileges, donations, synodal *acta*, and matters relating to the *patrimonium* of Saint Peter, as well as serving as papal advisers, diplomats, and envoys. At about this time, the papal chancery, archive, and library were organized around their efforts.

In the wake of the Germanic invasions, Roman law and its roles for notaries remained intact in Byzantine areas, though bishops usually inherited even the civil aspects of administration and the Greek language often replaced Latin. The *notarius ecclesiae* came to fill private and ecclesiastical functions, both drawing up and recording documents. The dramatic shifts in civic culture and government certainly reduced the supply of and demand for notarial services. By the eighth century, the terms *tabellio* and *exceptor* had disappeared in Germanic northern Italy, though in the Ostrogothic and Lombard periods these functions were continued by *scriptores* and notaries. The *notarius civitatis* ("of the city") served Lombard kings and nobles in their courts; *notarii ecclesiae* continued to aid bishops, abbots, and some of the public. These two kinds of notaries attended the same episcopal schools, and Petrucci (1958) believes that the existence of ecclesiastical notaries led to the demand for secular ones. Unorganized and unregulated "lay notaries" (*publici notarii*) handled private matters, since the Lombards did not practice *insinuation*, the official recording of private notarial acts. From the late 600s on, significant organizations of notaries (and probably notarial education) existed in Pavia, Cremona, Milan, Lucca, and, of course, Rome and Ravenna.

The Carolingians' taste for order and uniformity dictated changes during the ninth and tenth centuries. Under Charlemagne, church notaries were raised in status to the diaconate or priesthood, and the notariate became a stepping-stone to higher church office. These men also continued to serve as public notaries until the twelfth century and the full emergence of a lay notariate. Charlemagne mandated that every bishop, abbot, and count employ a notary, appointed by himself if necessary. He thus accepted and altered Lombard practice, formalized it, and spread it to the rest of his empire. His own secretaries were the *cancellarii*; and notaries, such as Paul the Deacon, served him in other ways. Paul was trained at Pavia, was chancellor to the Lombard king Desiderius, wrote the *History of the Lombards*, taught at the Prankish palace school (782–787), and may have been responsible for reform of the notarial system. The famous *missi dominici* oversaw the work of comital (counts') and episcopal notaries, who, under Louis the Pious, were drawn specifically from the noble class. Under Lothair I, imperial law regulated notarial practice of both *cancellarii* (now episcopal or comital) and private notaries, and limited the geographic jurisdiction within which one could operate.

Imperial Ravenna, and perhaps other Byzantine sectors in Italy, retained separate *scholae* of imperial notaries, ecclesiastical notaries, and *tabelliones*. With the fall of the Exarchate, imperial notaries all but disappeared until the revival of Roman law, with nonauthorized *tabelliones* absorbing most of their legal jurisdiction and function. During the eleventh century and the early twelfth century, attempts to bring the tabellionate under imperial purview were resisted and failed at Ravenna, though by the thirteenth century many professionals styled themselves *notarius et tabellio*, combining both functions in their practice. By the thirteenth century, even the Ravennati adopted the title "notary by imperial authority," and the retrograde tabellionate slowly dissolved. The ecclesiastical notariate in Ravenna retained its position until the twelfth century, but it did not interfere in the sphere of the secular notariate. During the 1100s, the lay tabellionate absorbed most of the functions of the church notary, even running Ravenna's episcopal chancery by 1127. Elsewhere in Italy, where it had survived, the independent ecclesiastical notariate likewise slowly disappeared; in Lucca, the comital notariate replaced it during the Carolingian period;

and in Bologna, home of the revived imperial legal tradition, the bishop's last clerical notary died in 1133. Even in Rome, lay notaries gained in importance, and in 1211 Pope Innocent III declared that no notary in a church court could hold major orders (a restriction much argued against afterward).

In southern Italy, many areas that fell to the Arabs lost the Latin notarial tradition; and some—such as Puglia, Calabria, and Lucania—held to Greco-Byzantine practice. Areas retaining Latin-Lombard traditions used the *notarius*, but he may have drawn his authority from the palace, church, monastery, or even city; or he may have been itinerant, without official authority. During the tenth century, Naples maintained a clear organization of *curiali* (notaries) in a *collegio* under a *primarius* aided by a *talndarius*. Documents were often drawn up by *discipuli*, who may have been apprentices, but only the *curiale* could apply the *completio*. Amalfi, under the Neapolitan duke, followed a similar though looser pattern of organization. *Scribae civitatis*, as they were originally denoted, became *curiali* by c. 1000. Many may have worked only part time, as most surviving documents are dated the first or the fifteenth of the month; and, though persons who were not *curiali* did draw up documents, there was no clear caste of *discipuli*. Gaeta retained the *scriba civitatis*, though mixing Greek with Latin traditions and clerical with secular functions and statuses. In the tenth and eleventh centuries, titles included *presbyter* (priest) *et notarius civitatis* and *Leo greco-latinus presbyter et scriba civitatis*, though by the early twelfth century a simple *notarius civitatis* would do.

The Normans initially left much intact in the southern Latin areas, while trying to impose Latin forms and practice in the Greco-Byzantine and Arab-dominated regions. Gradually, the king, and later the emperor (from Henry IV to Frederick II), was recognized as the source of notarial authority. Norman kings also regularized disparate practices in handwriting, the use and registration of professional notarial insignia (*signum*), and the presence of signatory witnesses. As a result, the prestige and position of the notary were enhanced. The Constitutions of Melfi, promulgated by Frederick II, went further, requiring clear handwriting (*communem et legibilem*), the use of long-lasting parchment, and clear signatures by witnesses (preferably "with knowledge of letters") and the notary; Frederick II also, however,

required the signature of a judge on each document. This might be considered a check to the notary's professional evolution, though the practice waned, especially by the fourteenth century, when many judges could sign only X or +. The Angevins and Aragonese introduced essentially minor changes and refinements.

In the north, late and post-Carolingian anarchy led to a localized notariate that operated under scant official authorization until the mid-tenth century. Two kings—Hugh and Berengar—recentralized the profession, and the Ottonians (963-1024) further standardized and organized it. The source of notarial authority remained an issue, however, and in Pistoia as late as 940 there were both royal notaries (*notarii domni regis*) and imperial notaries (*notarii domni imperatoris*). With the eclipse of Italian kingship, the formula *imperiali auctoritate notarius* ("notary by imperial authority") became standard (also in the south during Frederick II's reign); it remained in force until the modern era. The emperor's authority flowed through the counts palatine and eventually through lesser nobles, civic governments (e.g., Parma in 962), monasteries, and bishops (who were his vassals). With the Gregorian reform movement and the clashes between the papacy and the emperors during the later eleventh century, popes also claimed ultimate authority over ecclesiastical and Roman notaries, which flowed through the apostolic protonotary to the notaries or bishops. The notary thus took on a fully public role, acting as a third party to private acts with "magistrate's authority" and giving "public faith" to the acts thus recorded; this representative of public authority (not merely local but ultimately imperial) wrote up, dated, signed, and sealed the documents that regulated an enormous range of personal as well as official interactions. These documents came to have the essential force of statute in reference to the individuals involved.

This development proceeded with the revival of Roman law and organized civic life in the eleventh century. Gregorian reform sought to clarify the lines between secular and ecclesiastical matters; e.g., keeping lay notaries away from church business, and maintaining papal authority over church notaries. The "rediscovery" of *Corpus juris civilis* and its application to the legal and notarial professions laid the foundation for uniform practice in civil matters, just as the roughly contemporary development of canon law did for ecclesiastical legal

business. Notaries had always retained certain elements of official or ceremonial rhetoric for use in their documents, but there now began to emerge from *ars dictamini*—or literature on the art of letter writing—a branch devoted to typically notarial matters known as *ars notariae*. A book containing models for use in constructing documents—salutations, forms of address, legalistic *formulae*, phrasing of the *completio*—came to be known as a "formulary" (*formularium instrumentorum notariorum*). The earliest example may have been the papal *Liber diurnus* (late seventh century—eighth century), which contained 100 canonical *formulae*. The civil law, as adjusted and applied by such legal scholars as Guarnerius and Irnerius, who wrote the earliest civil formulary (*Formularium tabellionum*), and as adopted by reforming cities, required uniform verbal expression by men trained in this art, and training required more than simply models. The earliest secular manuals with wide circulation date from the thirteenth century: twenty-four formularies survive from 1200-1250; and Boncompagno da Signa (died c. 1235) wrote treatises on wills, statutes, and privileges. But the earliest *summa artis notarii* that combined elements of both, covering all aspects of notarial practice, was by Ranieri da Perugia (1223-1245), and the best and longest-lasting was by Rolandino de' Passeggeri (1255), who defined the notarial art as simply "the writing down in authentic form of the lawful business of men in a finished and rational document."

From the eleventh century on, as cities reemerged and grew, notaries played major roles in their "elaboration of government and ordering of social life." From the beginnings of the communal movements, notaries were leaders in challenging older feudal and ecclesiastical authorities and establishing new governments. Their literacy, legal expertise, close connections with lawyers and judges, and traditional roles in Roman municipal governments ensured that they would occupy high civic positions. Communal regimes and their offices required the services of notaries as letter writers, record keepers, and statute framers. When factions of the *popolo* overthrew the older civic oligarchies in the thirteenth century, the generally lower-class notaries—often the best-educated and most articulate laymen in the movement—played vital parts, as illustrated by the later career of Rolandino de' Passeggeri. Later, however, the notary's conservatism often shone through in his

support of the stabilizing one man rule that characterized the northern and central Italian *signorie* of the fourteenth century.

A city's chief notary was the chancellor (*cancelliere*), who had authority over all lesser notaries and who served the needs of the civic executive. Every level of government, every office with official functions, every court, and every guild employed at least one notary, as did ecclesiastical and quasi-public institutions such as hospitals and universities. Notaries recorded the minutes of meetings, carried on correspondence, and handled virtually all routine legal matters. In Florence, the *notaio delle riformazioni* authenticated and attested to all communal legislation, and every ambassador relied on a notary to draw up official documents. In maritime mercantile cities such as Genoa and Pisa, notaries tended to be fewer per capita than elsewhere, perhaps owing to higher rates of general literacy, but they played key roles in both commerce and diplomacy. In Genoa, they served as scribes for commanders of galley fleets; as companions for ambassadors; on the staffs of the city's creditor organizations, the *compere*; and as officials for the Genoese colonies in the eastern Mediterranean. For both communes and *signorie*, they formed essentially a civil service that was vital to urban government and provided continuity whatever the changes in regimes. In 1327, the city government of Modena employed fifty-one notaries, and Perugia had 108 on its payroll in 1381.

Part of their power in society stemmed from their organization into guilds, often combined with the very highly regarded judges and lawyers. In cities with law schools, such as Bologna and Padua, however, the guilds were kept separate. Lawyers and judges were products of university training and often came from noble families, whereas notaries were usually commoners who had attended local schools or merely served apprenticeships. In either case, their guilds regulated all aspects of notarial life, from training and entry into the profession to the collection of a deceased notary's books. They established uniform procedures, protocols, fees, examinations, forms for records, and ethical standards, and set them down in their statutes.

Guild organization reflected communal organization (or perhaps vice versa), as demonstrated by the case of Florence. The guild of judges and notaries was established by 1212, though it may have existed as early as 1190 or even 1150. The head of the guild was the proconsul, at times

necessarily a notary. He had to be at least thirty-six-years old and a guild member for at least ten years. He served for six months, during which time he lived in his own *palazzo* in Via del Proconsolo. Eight consuls—at one time two judges and six notaries, at another time all judges—aided the proconsul and arbitrated disputes. During their four-month terms, they lived in a modest residence in Via de' Pandolfini. At the end of their terms, they underwent an audit or *scrutinio* to ensure that they had carried out their duties honestly and ethically. A treasurer and provisor, both notaries elected to four-month terms, handled guild funds and guild property, respectively, and were likewise scrutinized. There was also an advisor)' council of ten notaries and six judges, and a larger council for special matters. In the later thirteenth century, notaries and judges voted on major issues first as separate groups and then as a body, in the church of San Piero Scheraggio.

In many, perhaps most, cases, the Italian notary had a notary for a father. Some notaries employed private tutors while others sent their sons to monastic school for a basic education. By the thirteenth century, many cities had both grammar and notarial schools supported by the commune. Bologna alone required university courses (directed by the arts faculty rather than the law faculty). Apprenticeship might replace formal education, with a quick trip through grammar and concentration on *ars dictaminis* and then on *ars notariae*. Pisa's guild required a four-year apprenticeship including at least four years of Latin. Both Siena and Florence mandated a minimum of two years of formal training or apprenticeship. Bergamo required only one year and a minimum age of eighteen. In Florence, one could enter the guild between the ages of seventeen and twenty with a dispensation but would normally enter after age twenty. A Florentine candidate was examined by four notaries and a lawyer in separate tests on Latin and vernacular Italian, handwriting, and knowledge of legal documents. Induction cost eight florins, and the new notary had to post a "guarantee" worth 200 *lire*. In the Romagna, the imperial representative presented the new notary with a deed of authority, they exchanged a "kiss of peace," and the initiate swore an oath of fidelity over the Gospels. The notary also registered his personal *signum* and adopted the formal title *ser*.

In 1291, the Florentine guild had some 575 members, with 376 working in the city itself. At about the same time, Milan had roughly

1,500; Padua 600; and Genoa only 200; but Bologna had nearly 2,000 active notaries. In Prato in 1339, of 139 heads of households whose professions were listed, 102 were notaries. In Florence's *catasto* of 1427, notary is the largest professional class. The mere numbers suggest the importance of the occupation, and also that it was highly competitive. In fact, many notaries held other jobs as well, the most important of which, arguably, was teacher of grammar. The typical notary, as notary, made a meager living from drawing up documents (sometimes fees were based on the value of the transaction), which he could augment in a number of ways both legal-ethical and not. He could forge documents or gain inside knowledge of "deals"—for example, when an institution was about to sell rather cheaply land that it held. As frequent communal officeholders, notaries could benefit from the perquisites of their positions and from the political connections they made. Cities that used tax farming, like Lucca, often awarded these lucrative contracts to notaries. Wealthy merchants and bankers made excellent clients who exploited their notary's social and professional connections, and sometimes became excellent patrons who shared valuable information or opportunities with their notaries. Some notaries purposely relocated: when a city had a large colony of merchants elsewhere—as Florence and Siena had in Avignon during the fourteenth century, or Genoa had in Pera or Caffa, or Venice had in Constantinople—one could always find notaries from the home city there.

Legal formulations increasingly encroached on most aspects of private life, and these were controlled by the notaries. As Larner (1965) puts it, "all economic life flowed through the pages of his cartulary": agreements for dowry, marriage, wet-nursing, house painting, commercial partnerships, mercantile insurance arrangements, large donations to churches—virtually any written arrangement between two unrelated people required or was strengthened by the services of a notary. Not least important was a person's *testamento* (last will), whose terms could conceivably have been shaped by the notary (who could not, however, draw up any document that benefited himself).

The importance of the notary in Italian culture is immeasurable, not least in shaping its literary elements. Nearly all the earliest civic chronicles were begun and maintained by notaries who had the requisite verbal skills and access to the highest levels of government

and society. This advanced the sense of civic identity and pride that led directly to the "civic humanism" of the late fourteenth century and its foundation in accurate historical reconstruction. By the thirteenth century, many chroniclers were illustrating their works with official documents from their civic archives, a practice that expanded to include large numbers of charters, letters, and statutes as a basis for expounding a city's history. The notary's early exposure to and continual use of classical rhetoric sometimes developed into literary interests in Roman writers, eventuating in a rehabilitation of Cicero the rhetorician (and lawyer, to Petrarch's horror). The emphasis on facts rather than fantasy, on lay civic culture rather than courtly or ecclesiastical culture, and on classical rhetoric rather than scholastic philosophy led directly to the Renaissance. The list of Florentine notaries with notable literary achievements is long indeed and includes Latini, Salutati, Bruni, and Machiavelli.

From the Fourth Lateran Council (1215) on, church court sessions required the presence of a notary (clerk) as a neutral third party, and copies of relevant documents were given to both parties "to protect the innocent party against judges who are imprudent and dishonest," as the council stated. The notaries went by various titles—*notarius*, *tabellio*, *clericus*, *mandatus curie*—and the permanent register of court documents was kept by the *notarius deputatus ad acta scribenda*. The Avignonese period saw the establishment of the Rota appeals court, with its demand for notaries; and the first official ecclesiastical *Fortnularium notariorum* (1327), the ultimate source for all later church formularies.

Novara

Novara is the name of a city, diocese, and province in the Po valley (today Piedmont), west of Milan. Ancient Novaria, founded by the Romans during the second century B.C., lay on a road from Milan by

way of Vercelli to Ivrea. Of the original Roman walls built in the first century after Christ, a few remains still exist.

The legend of the first bishop of the city, Saint Gaudentius, reflects the Christianization of Novara during the fourth century. Novara is the only diocese in northwestern Italy which has a complete register of all bishops since the introduction of Christianity. Therefore, one may assume that Novara remained an episcopal see even in the confusion of late antiquity and of the Lombard kingdom. Bishop Adalgisus (r. 830—848) founded the cathedral of Santa Maria and the collegiate church of San Gaudenzio. Privileges of Carolingian, Ottonian, and Salian emperors protected the position of the bishops of Novara. The existence of a cathedral school in Novara and cultural contacts with the realm north of the Alps (Reichenau, Wurzburg) are proved for the tenth century. Today, the library of the cathedral chapter still has an important collection of medieval manuscripts.

The long supremacy of the bishops over the city and province of Novara was gradually replaced by the rule of the commune in the twelfth century (in 1139 we find the first reference to *consules*). The cityscape was also modified considerably in this century. After the destruction of Novara in 1110 by the emperor Henry V, the city entered a time of economic prosperity. The city walls were rebuilt first, followed by several ecclesiastical buildings and the first communal palace (*domus consulum*, 1178). Moreover, numerous channels were excavated in the countryside surrounding Novara. In the major political conflicts, Novara was initially on the side of the emperor Frederick I Barbarossa; however, in 1168, the city joined the Lombard League under the leadership of Milan. Thereafter, the connection with its immediate and predominant neighbor, Milan, remained a constant factor in Novarese politics. Equally permanent was the antagonism of Novara toward the city of Vercelli—after the counts of Biandrate had lost their position as the most important feudal power in that region—which was caused by competing territorial interests in the Sesia valley. After the Milanese were defeated by the troops of Frederick II at Cortenuova (1237), Novara was associated with the Swabian emperor for a short period. In the long term, however, the city came inexorably under the influence of Milanese expansionist politics. The various *podestà*, who ruled in Novara from 1185 on (initially sporadically, but after 1200 regularly),

came almost exclusively from Milan. In the second half of the thirteenth century, the estimated population of Novara was approximately 3,000 to 5,000. In that period, the internal conflicts over supremacy in Milan (among the Della Torre and Visconti) spread to Novara as well. The codification of the statutes of Novara dates from this time (1277). In 1332, bishop Giovanni Visconti incorporated the city into Milanese territory, and Novara thus became part of the late medieval and early modern territorial state of Milan.

Novella

Framed collections of tales from the orient (*Kalileh and Dimnah* or *Directorium humanae vitae*, *Disciplina clericalis*, *The Panchatantra* or *History of the Seven Sages*) and collections of exemplary anecdotes for use by preachers were circulating in Europe before 1300; but the *novella* as an Italian literary genre came to prominence with Boccaccio's *Decameron* (1350–1351). The popularity of this collection of tales, with its framing narrative and its appealing combination of popular and literary elements, encouraged many imitators throughout the following centuries. By c. 1400, the *novelle* of Sacchetti, Sercambi, and *ser Giovanni Fiorentino*, all influenced by Boccaccio, had appeared.

Novelle could mean "news," as in Sacchetti's anecdotes of recent events, or "new and strange things" as in the more fantastic tales of *ser Giovanni Fiorentino*. Thus *novelle* include both historically true and fabulous material. Within the variety of topics—and variety was one of

the aesthetic principles of these collections—several themes, often humorous or satirical, predominate: the hypocrisy, lust, and avarice of friars and other clergy; the clever deceitfulness of women; practical jokes or witty replies; and love stories, realistic or romantic, tragic or comic, moralizing or wish-fulfilling.

Not all collections were bound by a narrative frame, but many were. The framing tale is often a "disaster"—a plague, flood, snowstorm, or exile—during which a small group of people cheer each other up with stories. Recreation through tales and songs was recommended by doctors to maintain the balance of humors important for health, and thus especially as an antidote during times of plague or distress. Even Sacchetti, who does not use a frame, offers his tales as a recreative moment for people living in stress or sorrow.

Oral and popular sources remain important for the genre, which never aspires to anything beyond a modest literary status. Even within the written books there remains at least a fiction of orality, as the tales are told aloud by members of a group to one other. We know from other descriptions of social gatherings and street-corner entertainers that such stories were indeed often read or told aloud and commented on by the audience, just as happens within the book.

Novellino, Il

Il novellino, an anonymous collection of tales, untitled in most manuscripts, was written in Florence between 1280 and the early 1300s. Its stories are drawn from a wide range of sources including the Bible; classical mythology; Persian and Arabic collections of stories; medieval chivalric stories; miracle legends and lives of saints; and historical anecdotes from Valerius Maximus, Vincent de Beauvais, and the *History of Charlemagne*. In *Il novellino*. Narcissus, Lancelot, Jesus, Cato, Nebuchadnezzar, Frederick II, Saladin, Trajan, and Saint Gregory

minge with courtiers, lawyers, servants, and street vendors in brief but lively anecdotes, witticisms, and moral tales. The preface suggests that they are offered to enliven the conversation of people who do not know good stories of their own; and one manuscript and an edition of 1572 call the work "the book of tales and fine gentle speech." The various fourteenth- to sixteenth-century manuscripts and sixteenth-century editions differ in the number, selection, and order of tales. The first printed edition (1525) was encouraged by Pietro Bembo, who owned a manuscript (now in the Vatican) and liked **comparing it to Boccaccio's *Decameron***. Thus, its first printed title was *The Hundred Old Tales (Le cento novelle antiche)*, with reference to Boccaccio's later hundred stories. The collection must have been popular before then, for tales from it appear in the writings of Dante (*Purgatory*, 10.73-93), Boccaccio (*Decameron*, 1.3 and 1.9), Chaucer ("Pardoner's Tale"), and others.

Numerology

Throughout the Middle Ages, numbers were deemed to possess a symbolic order of meaning, having the power to reveal divine truths by means of a rational calculus. Because numbers supposedly contained the hidden truths of God's creation, medieval philosophers and theologians sought in their writings to show precisely how the structure of the universe and the course of human events through time revealed God's shaping hand. In the Bible, numbers were mystical signs that pointed to eternal truths and at the same time served to demonstrate to the intelligent mind the perfection and order of God's plan (Isidore, *Liber numerorum*). A compelling form of allegoresis or symbolism, numerology, in reality more an art than a science, had the power to induce delight in divine creation and belief in the creator's purpose. Theologians cited the Bible in support of the notion that numbers symbolized eternal truths, the fundamental passage in this regard being Wisdom 11:21—*omnia in mensura et numero et pondere*

disposuisti ("thou hast ordered all things in measure, number, and weight"). Augustine, who did more to endorse the acceptance of numerology in the west than any other theologian, adverts to these verses approvingly in *The City of God* (11.30). By the High Middle Ages, number science had become fully established by the biblical exegesis of numerous theologians, foremost among them Hugh of Saint Victor, who defined the symbolic computational properties of numbers in *Exegetica* 15 (*Patrologia Latina*, 175.22); and by the arithmology of Martianus Capella (*De nuptiis*), Isidore of Seville (*Liber numerorum*), and Rabanus Maurus (*De numero*). This tradition was familiar to those who wrote in the vernacular as well as in Latin and for secular as well as religious purposes, but all writers shared a belief in the power of numbers to endorse and reinforce acceptance of ethical values. Numbers, then, were signs of good and evil; and the perceptive reader of world of nature (*res*) or the fictive realm of a written text (*verba*) could take from them both moral instruction and aesthetic delight in deciphering God's truths or a poet's vision. Number symbolism was virtually a sacred science.

Ail numbers, in theory, were thought capable of expressing symbolic meaning, but some more than others acquired special and enduring significance, to the extent that their symbolic properties became conventional among medieval thinkers and writers. The symbolic significance of the numbers 1 through 10 is virtually universal, with 1, 3, 7, 8, and 10 having special value. The primal number 1 signifies unity, which is God the creator; 3 signifies the Trinity; 7 is the number of creation and by extension life and the world itself, thereby symbolizing completeness and perfection, because God created the universe in seven days; 8 is the number of resurrection and salvation, because it goes one beyond the number of terrestrial life; and 10 is the number of perfection, because it is the base on which all numbers are built.

If the creator ordered his universe according to numerical patterns, the writer can express and endorse these truths in writing by imitating his procedure. Numbers have not simply aesthetic import but philosophical and theological significance: they have the power to convey hidden truths. Hence all aspects of the form of a literary work have potential meaning: the number of books in a work, verses in a stanza, or characters in a scene; the relation of any part to the whole;

the time that events take place; etc. Number symbolism works by analogy, symmetry, and association; consequently, identifying the presence of a numerical feature in a literary work has the power to invoke a full set of ideas and ethical values.

Systematic use of numerological significance in medieval Italy is most evident in the works of the *tre corone*—Dante, Boccaccio, and Petrarch—and it reaches its most complex and highly developed form of expression, as is well known, in Dante. For all three writers, numerological patterns prevail in their vernacular rather than their Latin works, and each uses numbers to create or reinforce a particular symbolic order of meaning.

Dante Alighieri

Dante's love of numbers begins with his love for Beatrice. *Vita nuova* establishes her identity with the number 9, the square of 3. The poet-lover repeatedly discovers that important moments in her life and their relationship are related to the number 9. He first sees her when both are in their ninth year; he does not see her again until another nine years have passed; she dies in 1290, the ninth decade of the century. In chapter 29, Dante discloses that she is related to the number 9 because she is related to the harmony of the creation itself, which has nine heavens, and to the Trinity, which is *fattore per sé medesimo del nove* ("the sole factor of nine," *Vita nuova*, 29.3). This association, which makes her a *miracolo* ("miracle"), affiliates her directly with the divinity. The term *miracolo* should be understood in its theological sense, as an external demonstration or sign of divine revelation. The root of the number 9 is, moreover, a structural feature of the book. As Charles Norton noticed more than a century ago, the placement of the thirty-one poems of *Vita nuova* reveals a conscious pattern based on the number 3. There are three and only three complete *canzoni*, so arranged that the second occupies the precise numerical center of the work and defines a chias tic (i.e., characterized by chiasmus) ordering of all the poems: ten poems, first *canzone*, four poems, second *canzone*, four poems, third *canzone*, ten poems. This symmetrical arrangement, which places the poet's vision of Beatrice's death at the poetic center,

thematically relating it to Christ's death and resurrection, turns on the number 3, the number of the Trinity. This pattern underwent some refinement in the hands of Singleton (1965), who argued that it was better to view the first set of ten poems as $1 + 9$ and the last set as $9 + 1$, and the center panel of four poems, the second *canzone*, and four succeeding poems as a 9. His eventual pattern, $1 + 9 + 1 + 9 + 1 + 9 + 1$, had its own elegance and suggestiveness, but the logic for such a division lacks the kind of strong internal evidence that one finds in Norton's pattern. Gorni (1990) has proposed an entirely different structure based on a revised edition of the text that posits three sequences of nine chapters (*novene*), followed by a coda of four chapters. This pattern stresses the centrality and interrelation of both 3 and 9, the numbers of the Trinity and of Beatrice, in a poetic context that has numerous thematic symmetries. The point of all such numerological patterning is, of course, that Beatrice's relation to Christ as the divinity is inescapable and the work of the divinity itself, not the poet.

The *Convivio*, which Dante wrote a decade after *Vita nuova*, appears to be little indebted to number symbolism, although the structure is clearly governed by the number 5 and its multiple 15. There were to have been fifteen *trattati* (treatises, or books): an introduction and fourteen others. Interestingly, all books except the first are based on the number 15. The second and third each have fifteen chapters; the fourth has thirty and is clearly divided thematically into two halves of fifteen each.

It is in the *Commedia* that we find the most sustained symbolic use of numerological principles. Its 100 cantos, symbolizing the totality and perfection of the universe (the perfect number 10 multiplied by its own perfection), break down into three major parts, or canticles (*Inferno*, *Purgatorio*, *Paradiso*), which in turn divide into cantos (nearly) equally distributed among them ($34 + 33 + 33$). Critics traditionally view the slightly greater number of cantos in *Inferno* as $1 + 33$, the first canto being a prologue or introduction recounting events that take place before the journey through the other world has begun. Indeed, its last line, *Allor si mosse, e io li tenni dietro* ("Then he moved, and I followed after him," 1.136), seems to define the moment of departure. Further support for isolating the first canto is the fact that the invocation to the

muses, which is placed in the first canto of each of the other two realms, appears only in Canto 2 of *Inferno* (2.7-9), thereby creating a precise numerical correspondence among the three realms.

The number 33, which invests the formal structure of the cantos, reappears in the next lower level of poetic division, the *terza rima*, a stanzaic form invented by Dante and based on a triple rhyme that binds each of the 14,233 hendecasyllabic verses of the poem. Just as each canticle contains thirty-three *canti* (plus the prologue of *Inferno*), so each *terzina* contains thirty-three syllables (3 X 11). The constituent parts of the *Commedia*, then, give a privileged place to the numbers 3 and 33—the sign of the Trinity and one of its most important multiples, since Christ died at the age of thirty-three. The poem marks the presence of Christ's death in every succeeding *terzina*, a death that signals the possibility of resurrection and eternal salvation. The poem's length—14,233 verses—itself records the presence of Christ's sacrifice in the last two digits. (Dante even divides his *Letter to Cangrande*, conceived as an introduction to *Paradiso*, into thirty-three sections.) It has often been observed that Christ's name is never spoken in hell and does not appear in the text of *Inferno*, as if to call attention to his triumph over evil and his dissociation from the realm of Lucifer, as well as to the sinners' utter ignorance of the power of redemption. But the text secretly records his tacit omnipresence, the imprint of his being, for the crucifixion is the central event of history on which all meaning hinges.

Dante's poem begins *in medias res*, in the middle of the journey of life, *net mezzo del cammin di nostra vita* (*Inferno*, 1.1). In a literal sense, that moment occurs at the arc of life, in the thirty-fifth year, half of the three score and ten that the Bible gives as the norm for human life (Psalms 90:10; Isaiah 38:10). In Dante's reasoning it was therefore proper that Christ should die in his thirty-fourth year, before reaching the point of perfection: "Christ had a perfect nature and desired to die in the thirty fourth year of his life, because it would not have been fitting for a divinity to enter into such a decline as [represented by passing beyond maturity into old age]" (*Convivio*, 4.23.10). By a stroke of numerological luck, Dante happens to be precisely in the thirty-fifth year of his own life at the time he undertakes his journey through the otherworld. His journey, then, takes Christ as its model, which is the

model for all who would be saved, an analogy further reinforced by the date assigned for the journey, Good Friday 1300.

Number symbolism governs not only the overall formal structure of the poem but the structure of the otherworld realms as well. Critics are not entirely in agreement about how the three realms divide into parts and subsections. Several models have been proposed, and it is possible that, to some extent, these models can coexist. All seem to agree that each realm divides into three major parts, by which each realm mirrors and corresponds to the others, although how and where such divisions occur has occasioned disagreement. For some, hell separates into the ante-Inferno (the Neutrals), upper hell, and lower hell (the city of Dis). For others, the three categories of sin (Incontinence, Violence, Fraud) define the division. Purgatory divides into the ante-Purgatory (balancing ante-Inferno), Purgatory proper, and the earthly paradise. Paradise divides its ten heavens into either 3 (lower heaven, virtue deficient) + 6 (higher heaven, virtue proficient) + 1 (Empyrean), or 7 (planetary) + 2 (heavens of glory) + 1 (Empyrean). In every pattern, however, 3 is the operative number.

Each realm simultaneously divides into ten subdivisions. Hell has nine circles of sinners plus one for the Neutrals; Purgatory has two levels in ante-Purgatory, seven terraces on which sinful disposition is purged, and the earthly paradise, for a total of ten; and paradise has nine physical heavens and a tenth that lies beyond time and space (the empyrean). Other critics stress 9 as the proper number of circular divisions, however, discounting the ante-Inferno altogether as lying outside hell proper, defining the ante-Purgatory as an undivided area, and excluding the empyrean because it is beyond the claims of time and space. The fact that the number of circles, terraces, or spheres in the three realms can be counted as nine or ten is probably due to the fact that originally there were ten orders of angels (10 being a perfect number), until Lucifer and the rebellious angels fell, leaving nine orders, until man was created to make up the perfect ten (Bonaventure, *Sentences*, 2.9.7). In *Convivio* (2.5.12) Dante associates the number of the heavens with the angels: *Li numeri, li ordini, le gerarchie narrano i cieli mobili, che sono none, e lo decimo annunzia essa unitade e stabilitade di Dio* ("The moving heavens, which are nine, declare the numbers, the orders, and the hierarchies, and the tenth proclaims the very unity and

stability of God"). Because the number 10 symbolizes perfection (*lo perfetto numero*, "the perfect number," *Vita nuova*, 29.1) and the law (the Ten Commandments), one beyond, 11, came to signify transgression of the law and hence sin (Augustine, *City of God*, 15.20). It therefore appears significant that Dante should present the moral structure of sin in *Inferno* 11 and expressly give the ninth and tenth pouches of *Malebolge* at the bottom of hell circumferences of precisely 22 and 11 miles, respectively (*Inferno*, 29.9 and 30.86). If each verse of the poem figures forth the number of sin in its eleven syllables, Christ, whose number is 33, might be said to redeem that sin in each *terzina* (thirty-three syllables) through his sacrifice.

Numerology is one means by which Dante establishes hell as the symmetrical inversion of paradise. Just as all goodness derives from a triune God (the Trinity), so evil, being but a perversion of that goodness, echoes the number 3 in its forms. Dante is attacked by three beasts (*lonza*, *leone*, *lupa*) in the dark wood; three ladies (Mary, Lucy, Beatrice) set his journey in motion; his journey is challenged by a three-headed Cerberus, the three Furies, and a tripartite Geryon; there are three categories of sin, three rivers feeding into Cocytus, three faces of Lucifer, and three archtraitors. The three attributes of the deity inscribed on the gate of hell (*divina potestate*, *somma sapienza*, *primo amore*. "divine power, highest wisdom, primal love," *Inferno*, 3.5–6) find their inversion in the negative attributes of Lucifer; the colors of his three faces symbolize impotence, ignorance, and malice. The symbolism of 3 attaches to Purgatory (the subdivision into three areas, the three steps at Saint Peter's gate in *Purgatory* 9, the three nights spent there) as well as to paradise, where, in addition to the overwhelming presence of the Trinity throughout (especially in the sphere of the sun), the final image of the divine essence is of a triple rainbow: *tre giri/di tre colori e d'una contenenza* ("three circles of three colors and one circumference," *Paradise*, 33.116–117). And Beatrice herself is seated in the third tier of the celestial rose (*Paradise*, 32.7–9).

For virtually all medieval theologians, the most sacred number, 7, is the number of humanity, the fullness and wholeness of life on earth, and universality. It is the number of man, as the sum of the soul and body (3 + 4), and the number of time, because God created the universe in six days, resting on the seventh. While 6 also symbolizes time, it is

traditionally taken to represent the number of distinct historical eras from Adam and Eve to the present. At the close of his *City of God* Augustine posits a final, future era of peace and tranquillity on earth, a seventh age, which in turn heralds the age of eternal repose in the afterlife. Consequently, 7 symbolizes the fullness or completeness of earthly life. There are the seven days of week, seven ages, seven planets, seven tones in the Gregorian mode, seven diurnal canonical hours (lauds, prime, tierce, sext, nones, vespers, compline), and seven sciences (the trivium and quadrivium). The moral structure of Purgatory is based on the traditional opposition between the seven virtues and the seven capital vices. The seven virtues are balanced by the seven gifts of the Holy Spirit and the seven beatitudes. So significant is the mysterious power of 7 that Peter Lombard, at the suggestion of Hugh of Saint Victor and Roland of Parma, established in his *Sentences* that the holy sacraments should be seven because seven was a mystical number (La Monte 1949, 395). Among modern critics, Singleton has argued that Dante contrived to feature the number 7 at the very center of the *Commedia*, by arranging the length of the central canto and of the three cantos on either side of it so as to create a pattern of chiasmus. The fact that the central canto, *Purgatorio* 17, containing 139 verses, was preceded by cantos of 151, 145, and 145 verses, and followed by cantos of precisely 145, 145, and 151 verses, seemed to him part of a conscious design to depict the idea of "conversion," since chiasmus reverses the previous order of things, and to disclose a correspondence with the seven terraces of Purgatory. Moreover, Singleton believed that summing the digits of these verse numbers held further significance: the number of the framing cantos, 151, broke down into $1 + 5 + 1 = 7$, highlighting the number 7 yet again; and 145 became $1 + 4 + 5 = 10$, where 10 is the perfect number. But it should be observed that taking into account all canto lengths, from the shortest (the 130 verses of *Inferno* 7) to the longest (the 160 verses of *Purgatory* 32), summing the digits produces only four different numbers (4, 7, 10, and 13); and each of these numbers, except, perhaps, 4 (which occurs only four times), can be viewed as possessing symbolic meaning (13 being conceived, following tradition, as $10 + 3$). In the last analysis, because summing the digits virtually always produces an inevitable number, this kind of calculation may not be of special importance. Furthermore, symmetrical patterns

like the one Singleton noted can be found elsewhere in the poem (e.g., *Purgatory* 3-9: 145, 139, 136, 151, 136, 139, 145).

Because 7 symbolized the fullness of life on earth, the succeeding number, 8, came to express the idea of resurrection and salvation, as being one beyond 7; Christ's resurrection took place on an eighth day of the week; for that reason, Sunday became the lord's day and all major feasts are celebrated for eight days. It is also the number of baptism, because that rite establishes the possibility of the salvation of the soul. Consequently, a large majority of baptismal fonts and baptisteries in Europe are octagonal. On the closing page of the *City of God*, as noted earlier, Augustine speaks of a final eighth day of eternal rest in the otherworld following the seventh age in this world. The number 8 was also seen as expressing the idea of renewal in music, where the eighth tone renewed the first at the octave. In mathematics the symbol for infinity, called the lemniscate, is the number eight placed on its side; it was chosen because of the association between eternity and infinity, as well as because one could trace the number in writing continuously *ad infinitum* without lifting pen from paper. (The first documented use of this symbol is by the mathematician John Wallis, in *Arithmetica infinitorum* in 1656.) Significantly, Dante's earthly paradise—the garden on the summit of Purgatory that was the original site of the garden of Eden where man fell, now the locus of redemption—is placed on the eighth tier of the mountain. In paradise, the eighth sphere, that of the fixed stars, is the heaven in which the triumph of Christ and the church triumphant are manifested, thereby establishing a symmetrical correspondence with the appearance of the church militant in the procession in the earthly paradise.

Numbers may possess inherent, culturally assigned symbolic properties, as the preceding examples illustrate. But Dante also creates his own numerical symbolism on at least one salient occasion: his prophetic reference to the coming of the slayer of the Antichrist of his day, the papacy prostituted at the hands of the French king, Philip the Fair, who removed the papal court from Rome to Avignon. This mysterious figure is known only by the code name *cinquecento diece e cinque* (*Purgatory*, 33.43), or 515, a number formulated to echo in reverse the number of the Antichrist, 666, the beast of the Book of Revelation (13: 18). Despite a wealth of proposed solutions, some

reasonable, others far-fetched, the identity of Dante's political redeemer remains shrouded in mystery. Or perhaps it would be better to say that while the identity of Dante's hero is widely believed to be Henry VII of Luxembourg, no one is quite able to prove this numerologically. It has been suggested that the number expressed in Roman numerals, DXV, signifies Henry because those letters, rearranged, spell out the Latin word for "leader" (DUX, where V in Latin is the letter U). Edward Moore offered a suggestion that relied on gematria, or the numerical values of the letters in the Hebrew alphabet, to generate the name Arrico (a variant of Arrigo, or Henry). This suggestion may be the most ingenious, but it has not proved any more convincing than other interpretations. In fact, no attempt at decoding the conundrum of 515 can be said to have gained overwhelming favor: its significance remains a mystery.

Boccaccio

Boccaccio almost certainly had Dante's *Commedia* in mind when he assigned 100 tales to the *Decameron*, although his title derives from another work based on the temporal scheme of a sequence of days—Saint Ambrose's *Hexameron*, written almost 1,000 years earlier. By his title, Boccaccio sought to champion a new secular vision of human affairs that would shift the focus from the intensely spiritual and doctrinal attitude of his models to an emancipated celebration of life as it is lived, in its bounteous diversity, and of the virtues of *saper vivere*. Ten storytellers each tell one tale on each of ten days, making a total of 100 stories, a number that expresses universality within multiplicity and harmony within diversity. Critics have tried to decipher the moral and allegorical identities of the storytellers, and to explain Boccaccio's choice of three male and seven female protagonists. The most suggestive reading has been proposed by Kirkham (1978), who discerns a pattern based on the seven virtues (four cardinal and three theological) and three faculties of the soul (reason, the concupiscible appetite, and the irascible appetite). She finds support for this pattern in several other of Boccaccio's vernacular works that likewise make use of numerological symbolism. Her analysis of *Caccia di Diana*, *Amorosa*

visione (comprising 5 cantos), and *Teseida* suggests that if any number is most dear to Boccaccio, it is 5, which symbolizes marriage—2 (female) + 3 (male) = 5 (perfect union)—as well as the opposite, sensuality or adulter). (Dante may well have had a similar reason in mind for assigning his tale of Francesca da Rimini to the fifth canto of *Inferno*.) The *Teseida* comprises twelve books, in clear imitation of the epic convention that Virgil established when he evoked a proportional connection with the twenty-four books of the *Odyssey* and the twenty-four of the *Iliad* in his own twelve-book *Aeneid*. The association of the number 12 (or a multiple of twelve) with the structure of an epic became so compelling that both Milton and Tasso would extend their poems to proper epic length: *Paradise Lost* went from ten to twelve books, and the *Gerusalemme liberata* was expanded from twenty books to twenty-four in the *Gerusalemme conquistata*. After all, Statius had divided his *Thebaid* into twelve books, as Valerius Flaccus had intended for his *Argonautica*. Although Lucan's *Pharsalia* has only ten books, the poem, left unfinished, preserves signs that he intended to write twelve: Book 6, following Virgil, contains the underworld scene in which the future ruin of Pompey and Roman rule is prophesied.

Petrarch

It is clear that Petrarch intended his epic *Africa* to reach twelve books, even though he abandoned work in the ninth, for in Book 6 he inserts the mandatory underworld scene. His *Bucolicum carmen*, a collection of pastoral poems in Latin, contains twelve eclogues, but their topic has little to do with the epic world. His large collection of letters, *Rerum familiarum libri*, was originally divided in twelve, then twenty, and finally twenty-four books. The last division occurred at the time Petrarch was studying Greek with Leonzio Pilato, the first person to teach Greek in Italy. Since the last letter in the collection is addressed to Homer, it seems inescapable that Petrarch meant to pay homage to the greatest poet of antiquity, the father of the epic, by evoking the Homeric number.

If Boccaccio chooses 5 as his personal number, Petrarch embraces the number 6. It is the *senhal* of his beloved, Laura, as 9 was for Dante's

Beatrice. Petrarch's love for Laura, which informs the lyric collection known as the *Canzoniere*, is born on 6 April 1327, and Laura dies on 6 April 1348, dates that Petrarch makes coincide with Good Friday. The fact that in 1327 Good Friday fell on 10 April and that Laura died on 18 April indicates the degree to which Petrarch sought to fashion and preserve Laura's symbolic identity in poetic form. The number 6 had a long-standing connection in Biblical commentary: the birth of man takes place on the sixth day of creation, and the death of Christ on the sixth day of the week—both Fridays. One tradition, moreover, held that Christ died at the sixth hour of the day, at noon, just before the sun began its decline. Moreover, 6 symbolized the caducity of human life, the fleeting beauty of temporal joy, the vanity of human dreams, the imperfection of an earthly existence destined to pass away, and the inescapability of human mortality, a complex of attitudes the poet summed up in the figure of Laura. For Petrarch, Friday must have held etymological and nominative significance as well: *venerdì* is the day of Venus, goddess of love and sensuality, whose son Cupid is the formal cause of Petrarch's experience of love. Petrarch would also divide his only other vernacular work, the *Trionfi*, into six parts, although he ultimately left it unfinished.

The *Canzoniere* underwent multiple textual revisions at the hand of the poet, but in its final form it contained 366 lyrics, a number that has suggested to many critics a connection with the number of days in a year, symbolizing the course of life on a smaller scale, and the cyclic nature of the poet's love for Laura, which alternates between periods of exuberant joy and recriminatory contrition. Leaving aside those who consider the number entirely adventitious, there are three ways in which it has been interpreted symbolically. Some critics argue that it represents simply a leap year. Others are persuaded that it represents a year of 365 days, and that the first poem, which provides a retrospective judgment of the poet's amatory experience, functions as an introduction or prologue to the collection (hence a total of $1 + 365 = 366$). Still others accept the equivalence of 365 with the passage of a single complete earthly year but see the last poem, the *canzone* dedicated to the Virgin Mary, as representing life beyond death (Zottoli 1928). Hence the pattern is expressed as $365 + 1$, where the first number expresses a solar year on earth, under the aegis of the sun, and the second symbolizes the

perfection and uniqueness of eternity, which triumphs over earthly existence. Such a pattern not only is typical of medieval numerology—Augustine thought of 11 as the number of evil because it transgressed the number 10, which embodied the ten commandments—but has a corollary in *Trionfi*, which comprises a series of triumphs ending in the triumph of eternity.

Roche (1974) was the first to trace out an actual connection between the 366 lyrics and the day-by-day progress of the year. He discovered that if the first poem represents the first day, and if the first day is Good Friday, 6 April, then the beginning of the second part of the work, as defined by *canzone* 264, falls on Christmas, 25 December. The linking of the birth of the poet's love for Laura with Christ's death and the death of Laura with Christ's birth has seemed to many too precise to be mere happenstance, despite the presence of several complicating factors. Roche's groundwork for even more detailed connections with the liturgical calendar has received less attention, but any pattern that becomes excessively complex invariably invites a higher degree of skepticism on the part of readers.

O

Occitan Language in Italy

An Occitan dialect is still spoken in the Cottian Alps by the Waldensians, who in the fourteenth century composed religious texts in assonance or rhyme, of which *La Nobla Leïçon*, an exposition of the evangelical precepts and doctrines of the sect, is the most important. For the rest, Occitan existed in medieval Italy only as a literary language, understood at least since the last quarter of the twelfth century because the troubadour Peire Bremon lo Tort had stayed at the court of the margraves of Monferrat in 1176 or 1177. Other troubadours and wandering minstrels followed, and their presence is attested to at the courts of the margraves of Este in Ferrara and the counts of Malaspina in Oramala (Lunigiana). Soon, northern Italian poets—such as Sordello (born c. 1200 at Goito near Mantua), Lanfranco Cigala (attested to in Genoese documents, 1235-1257), and, among the minor poets, Bartolomeo Zorzi (a Venetian, imprisoned in Genoa from 1266 to 1273) and the Genoese Bonifacio Calvo—also adopted Occitan as their literary language, often with quite a few Italianisms. Dante (*Convivio*, 1.10) defended the Italian vernacular against those who preferred *la lingua d'oco*, but he himself was also capable of composing complete passages in that language to praise the troubadour Arnaut Daniel (*Divina Commedia*, *Purgatory*, 26.140-147).

Conversely, the poets of the Sicilian school and their "leader Giacomo da Lentini (attested to in 1233 and 1240), encouraged by Emperor Frederick II, a poet himself, imitated many of the forms and much of the content of the Occitan love lyrics by inventing their own literary language, based on the Sicilian dialect, Italianizing many key words and concepts of Occitan poetry, such as *pregio* for *pretz* ("merit," "distinction"), *gioia* for *gaug* ("joy") and *joi* ("pleasure"), and *valore* for *valor* ("merit," "price"). However, with the death of the emperor (1250) this artificial language disappeared, being "Tuscanized" by the scribes of

the manuscripts containing the Sicilian poets' lyrics.

Odo Delle Colonne

Odo delle Colonne (thirteenth century) is the author of two *canzoni*, transmitted by the Vatican Codex 3793, where they appear in the section reserved for Sicilians. The second *canzone*, *Oi lassa namorata*, bears no name of an author; but the first, *Distretto core e amoroso*, is attributed to *messer* Odo de le Colonne di Messina. There seems little doubt that he was from Messina. Monaci (1955), however, identified him with an Odo delle Colonne who was senator in Rome in 1238 and

again in 1241, but this hypothesis was rebutted by Torraca (1902). The title *messer* points to Odo's social prominence, but we know nothing about his life, and we have no proof that he was related to Guido delle Colonne.

Odovacar

Odovacar (Odoacer, Odovacer, Odovakar; c. 433-493) was of diverse barbarian parentage: his father seems to have been a Hun and his mother perhaps a Scirian, although he is also referred to as a Goth or a Rugian. Odovacar apparently is to be identified as the "Adovacrius" who in the mid-460s led a band of Saxons in an attack on Angers in Gaul. By the early 470s, he had decided to pursue a career in Roman service in Italy, where he became a member of the imperial bodyguard. In 476, he was proclaimed *rex* (king) by the barbarian soldiers in Italy

after their requests for land had been refused. Odovacar then proceeded to depose the young usurper Romulus (r. 475-476). He then notified the eastern emperor Zeno (r. 474-491) that the west no longer needed an emperor of its own and that he, Odovacar, would be content to rule Italy in Zeno's name in the capacity of "patrician." These terms were granted. In 489, Italy was invaded by Theodoric the Ostrogoth; and after being besieged in Ravenna for three years, Odovacar finally surrendered on condition that he and Theodoric would rule Italy jointly. Soon thereafter, however, Odovacer and his family were murdered by Theodoric. Odovacar serves as an example par excellence of barbarian adventurers who successfully pursued their careers in the midst of the decay of the western Roman empire.

Ognibene

Ognibene (d. 1185) was one of the earliest canonists. He taught at Bologna until 1157. In 1156 he published his *Liber aureus decretorum concordatorum*, an abbreviated version of Gratian's *Decretum*. It was intended to provide a brief guide to Gratian's complex collection. Ognibene served as bishop of Verona from 1157 until his death.

Old Roman Chant

Old Roman chant is the music for the liturgy of the Roman Catholic church as primarily recorded in five manuscripts, all copied in Rome between the eleventh century and the thirteenth. These consist of three books for the mass (Vatican City, Biblioteca Apostolica Vaticana, Archivio di San Pietro, MS F. 22; Vatican City, Biblioteca Apostolica Vaticana, Archivio di San Pietro, MS lat. 5319; and Cologny-Genève, Bibliotheca Bodmeriana, MS 74) and two for the office (London, British Library, MS Add. 29988; Vatican City, Biblioteca Apostolica Vaticana, Archivio di San Pietro, MS B. 79). In the sources for the mass, the texts and liturgical calendar that these books preserve are, on the whole, similar to the more familiar Gregorian chant repertoire (though they suggest an earlier stage of liturgical development than their Gregorian counterparts). Their melodies, however, are often quite different, showing a preference for stepwise melodic motion, long and elaborate melismatic passages, and recitational procedures that consist of the hypnotic repetition of two-note *podatus* figures. Yet undeniable musical relationships are usually clear between the Gregorian and Roman settings of the same liturgical text. Old Roman chant is, then, a different melodic redaction of the same repertoire that lies behind the more familiar Gregorian version, as opposed to truly distinct and non-Roman repertoires such as the Milanese and the Spanish.

Many theories have been advanced to explain the origins of Roman chant and its chronological relationship to the Gregorian corpus. The monks of Solesmes described it as a late and decadent curiosity and explained its highly ornate style as a corruption of the presumed original (which they were certain was preserved in the Gregorian sources). The subject lay largely untouched until 1950, when Stablein (1952) suggested that the Roman chant and the better-known Gregorian were sung simultaneously in seventh-century Rome. The earlier dialect, Stablein said, was the Roman, which he described as the original repertoire edited by Gregory the Great. The Gregorian version represented a thorough melodic revision of the chant undertaken by *singers* during the reign of Pope Vitalian (657-672), as an expression of Rome and the papacy's emergence as a world power free from

Byzantine and Lombard constraints. Josef Smits van Waesberghe and Ewald Jammers also saw the two versions thriving simultaneously in Rome: Smits van Waesberghe held that Gregorian was the chant sung in the papal court and described Roman chant as the version used in Roman monasteries; Jammers linked the origin of Gregorian chant to polyphonic performance in imitation of Byzantine practice.

The notion of two melodic redactions of a single repertoire, sung simultaneously in Rome, has been generally discarded following the work of Huckle (1955, 1980). He held that Gregorian chant stemmed from the introduction of the Roman chant into the Carolingian empire at the behest of Pepin and Charlemagne: "It is the result of the adaptation of Roman chant by the Franks, a version of Roman chant created by Frankish cantors, a kind of translation of foreign music into their own musical language" (1980). More recent studies have focused on the influence of orality on the transmission of both the Gregorian and the Roman redactions before they came to be written down, and the degree to which the extant sources for either version might better reflect the chant as it was sung in eighth-century Rome when it was first exported north.

Opicino de Canistris (24 December 1296-c. 1355) was born near Pavia, where his family was deeply involved in the Guelf faction. The family spent several years in exile in Genoa; there, Opicino learned the art of manuscript illumination. When the family returned to Pavia in 1318, Opicino became a chaplain at the cathedral and studied theology and law. In 1324, he was elected rector of the small parish of Santa Maria Capella. Opicino left Pavia in 1328, perhaps in the wake of political unrest, and settled eventually at the papal court at Avignon. In addition to various expectations of benefices in Pavia, he obtained the position of scribe in the apostolic penitentiary.

In 1334, Opicino suffered a severe illness that left him partially crippled and mute and impaired his memory. Although he regained almost all his faculties, the illness, in conjunction with a series of dreams and visions, seems to have caused a profound change in his attitude toward his life and religion, which he discussed and worked out in the two manuscripts written soon afterward. We have little information about Opicino's life from c. 1340 until his death in Avignon, probably in 1355.

From his autobiographical comments, we know that Opicino wrote and translated several religious works (including, for example, a book on the poverty of Christ). Of his extant works, *De preeminencia spiritualis imperii*, written in 1329, is a polemic defending the supremacy of papal rule. In 1330, he composed a vivid description of the city of Pavia and its religious and social life, which is a fundamental source for later medieval Pavian history. The two works written shortly after his conversion (c. 1336-1337) also survive. These untitled autograph manuscripts deal with a wide range of topics, connected by a concern for understanding the relationship between the visible and the spiritual worlds. Many of the examples and issues stem from his experience as a parish priest and as a citizen of one of the troubled communes of Lombardy. Opicino's technique in these manuscripts is particularly interesting, since he relies equally on texts and schematic drawings to develop and express his ideas. The drawings combine portolan charts of the Mediterranean with other types of maps, diagrams, and figural representations; the graphic layering characteristic of his work gave Opicino a way of expressing the world, the church, and even the individual Christian as a series of overlaid

realities, ranging from the material to the spiritual. Opicino's works, taken together, represent an important source for the political, religious, and intellectual concerns of one fourteenth-century Italian priest.

Orcagna, Andrea Di Cione

Andrea di Cione, known as Orcagna (d. 1368), belonged to an extended family of Florentine artists, among whom he and his brother Nardo are best-known to modern scholars. Both artists were also well-known in their own time. Indeed, in a list identifying the six most prominent painters of Florence, compiled in 1349 (near the midpoint of Andrea's career), Andrea and Nardo occupy the third and fourth positions, respectively.

Over the course of his career Orcagna worked as a painter, sculptor, and architect, but he was trained as a painter and identifies himself as such even on the great sculptured tabernacle in Or San Michele

(Orsanmichele). Thanks to the efforts of Kreytenberg and others, who have pieced together the extant documents and the known works, we now have a relatively comprehensive picture of Orcagna's career. We know that he matriculated in the Florentine painters' guild (part of the larger Arte dei Medici e Speziali) sometime between 1343 and 1346. We also know that he joined the guild of builders and masons in 1352. Between 1343 and 1360 Orcagna executed paintings and sculptures for many important civic and ecclesiastical sites in Florence, including the city's prison, the city grain market of Or San Michele, and the great mendicant churches of Santa Croce and Santa Maria Novella. At Santa Maria Novella, he was involved in the decoration of the Cappella Maggiore, one of the most important commissions of the day. Beginning in 1357 Orcagna participated in the ongoing planning of the cathedral of Florence; and in 1358 he was appointed *capomaestro* of the masons' workshop for the cathedral in Orvieto.

Orcagna (c. 1308-c. 1368), *Christ as Redeemer with Saints*. Polyptych (Strozzi altarpiece). Santa Maria Novella, Florence. Photo: © Scala/Art Resource, N.Y.

Orcagna's presumed early works include the great fresco of the *Triumph of Death, the Last Judgment, and Hell* for the nave of the church of Santa Croce, which was attributed to him following Ghiberti's testimony and is now generally held to have been painted in 1344-1345.

Another early work is a frescoed roundel depicting the *Expulsion of the Duke of Athens* (now in the Palazzo Vecchio), painted for the entry hall of Florence's prison, the *carcere delle Stinche*. This fresco, which has been attributed to Orcagna on stylistic grounds, was possibly commissioned as early as 1343-1344, immediately after the expulsion from Florence of the infamous duke of Athens, Walter of Brienne. It is a permanent version of the type of ephemeral defamatory images (*pittura infamata*) commonly commissioned by Italian cities to be painted on the facades of public buildings. In Orcagna's painting, realistic details, including a remarkably accurate portrait of the Palazzo Vecchio as it appeared during the rule of the duke of Athens, are unified in an abstract narrative structure to produce an effect of reality within a timeless image of the triumph of virtue over tyranny.

Until relatively recently, scholars of art history generally associated Orcagna with a retrogressive style of painting that supposedly took hold in Florence after the black death. In fact, Meiss (1951) considered Orcagna's great altarpiece *Christ with Saints Thomas and Peter*, made for the Strozzi Chapel in Santa Maria Novella, an example of this style. Although Meiss's study remains a powerfully persuasive piece of *eckphrasis*, his assessment of Orcagna's style as the repository of a general cultural psychology has been challenged by scholars who have looked less to the history of style and more to the circumstances of individual commissions to explain the formal characteristics of Orcagna's work. In this process, paintings like the Strozzi altarpiece have emerged as highly sophisticated visual structures. In his work for the Strozzi Chapel, Orcagna manipulated space and form to evoke a sacred vision, which appears in the midst of a panoramic view of the *Last Judgment* painted by his brother Nardo on the surrounding walls.

One of Orcagna's most important commissions was the richly decorated marble tabernacle for Or San Michele, designed and executed between 1352 and 1360. The site—on the main street leading from the Duomo to the Palazzo Vecchio—was not only the city's grain market but also a nexus of power. Or San Michele served as the center of devotion for the city's guilds, and Orcagna's tabernacle was commissioned by the Compagnia della Madonna di Orsanmichele to enshrine a miracle-working image of the Madonna that had made the site the center of a popular cult. Actually, the object enshrined in

Andrea's tabernacle was a newly painted image commissioned in 1346 by the *compagnia* from Bernardo Daddi. The tabernacle itself is a freestanding marble structure, inlaid with stone and gold glass and covered with relief sculptures, including scenes from the *Life of the Virgin*. The structure is neatly tied, both thematically and visually, to the surrounding loggia, with a crowning figure of Saint Michael (San Michele), rising to nearly touch one of the bosses of the vaulting. As Cassidy (1992) has shown, the tabernacle was also engineered to meet the needs of the cult, with movable screens which normally shrouded the image of the Virgin but which could be raised to reveal the icon on Sundays, feast days, and other significant occasions. It was in connection with this commission that Orcagna, a painter, became a member of the guild of masons and stone workers; and it was presumably through this project, for which he must have assembled a workshop of skilled masons and sculptors, that he established his credentials as an orchestrator of architectural decoration.

Ordinances of Justice

The promulgation in Florence of the *ordinamenti ai giustizia*, or "ordinances of justice," over several months in 1293 marked one of the final stages of the rise to full political power of the *popolo*, the association of prosperous, non-noble urban citizens who tended to dominate the guilds. The communal government issued twenty-two rubrics on 18 January 1293. During the priorate of Giano della Bella (15 February-15 April), the priors added five more ordinances to the original twenty-two. The communal councils approved several more rubrics in May, August, and September of 1293. As a whole, the ordinances of 1293 covered at least two areas of concern: they laid the basic constitutional foundation for the new regime of the priorate (established 1282), and they codified investigative procedures to be followed and civil penalties to be levied against magnate lineages for violence perpetrated against persons and property. They also included measures designed to eliminate governmental corruption. All in all, by defending the interests of the *popolo* (especially the lesser guildsmen or *popolo minuto*) against those of the traditional elite, the ordinances of justice helped provide political legitimization for the guild-based regime of the priorate.

The first four rubrics affirmed the political importance of the guilds, creating guidelines and eligibility requirements governing elections to the highest offices of the commune. Only guildsmen were eligible to be elected to the priorate; knights were excluded. Rubric 4 created a seventh member for the priorate, the *gonfaloniere digiustizia*, or "standard-bearer of justice." He commanded a 1,000-man military force and was responsible for the enforcement of the ordinances of justice and the maintenance of civic order.

The ordinances of justice of 1293 also codified discriminatory civil penalties and procedures to prevent and punish acts of violence perpetrated by magnate houses against each other and against members of the *popolo* (rubrics 5-22). Antimagnate legislation to restrain violent

behavior was common in communes throughout northern Italy; Bologna had passed similar legislation between 1282 and 1292. The tendency of magnates to engage in blood feuds and threaten *popolani* had been a menace to civic order. In 1281, the commune of Florence had required magnate houses to post a security bond, set by law in 1286 at 2000 *lire*, to guarantee peace and order in the city. The law of 1286 had designated a lineage as "magnate" in either of three ways: the inclusion of at least one knight in the past twenty years, designation as magnate by popular opinion, and the posting of a security bond. The ordinances of justice increased the number of lineages designated by communal officials as magnates from thirty-eight to seventy-two urban houses. In all, the commune considered about 147 lineages in the city and *contado* to be magnates.

The penalties outlined in 1293 were generally harsher than those outlined in the previous legislation, especially for acts of violence against property and persons. The ordinances of 1293 stipulated that a magnate who killed a *popolano* would lose his life and property. A magnate who struck a *popolano* without drawing blood had to pay a 500 *lire* fine. Guarantors (*fideiussore*s) had to pay the requisite fines if a condemned magnate defaulted. One provision extended special communal protection to church property, which was a traditional source of status and income for many magnate houses and over which several had often feuded.

The ordinances of justice also made magnates ineligible for the highest offices in the government (the *signoria*). As noted above, the priorate that presided between 15 February and 15 April, which included Giano della Bella (a champion of the interests of the lesser guildsmen), added five more rubrics to the ordinances on April 10 and 11. The most important one, which appeared as rubric 34 in the later edition of the ordinances (1295), excluded magnates from the "council of the hundred," from the special and general "councils of the captain of the people," and from the guild consulates. Another rubric stipulated that kinsmen would be held responsible for magnates who had refused to post the security bond and had committed a crime.

In May, August, and September, the communal councils approved several more measures to reinforce and strengthen the ordinances of justice. These appeared as rubrics 35-62 in the edition of 1295. The most

important of these supplementary rubrics (number 50 in the 1295 edition) declared that anyone excluded from the guild consulates or from the councils of the captain of the people was ineligible to be prior, standard-bearer of justice, or judge. This all-important law effectively barred magnates from serving in the priorate and was the most important anti-magnate measure passed by the government in 1293. The ordinances of justice therefore had helped redefine the criteria for elite status in the commune, shifting it from knighthood to membership in a guild.

Actual enforcement of the provisions appears to have been spotty, although the commune did establish a prison for magnates in August 1294. According to the chronicler Giovanni Villani (8.1), the first magnates to be punished under the provisions of the ordinances were the Galli. In 1295, the regime revised the ordinances of 1293 and issued another text that contained sixty-two rubrics, including those passed after April 1293.

Orestes

Orestes (d. 476) was a native of Pannonia (Hungary). He first appears as the notary (secretary) of Attila the Hun. In 449, Orestes was twice sent as Attila's ambassador to Constantinople. Following Attila's death in 453, Orestes vanishes from history and does not reappear until 475, when he was made patrician and master of soldiers by the western emperor Julius Nepos (r. 474-480). Orestes responded by marching on Ravenna in 475 and putting Nepos to flight. Orestes then named his young son Romulus as western emperor but retained the real power in his own hands. In the next year, Orestes was captured and killed by the barbarian chieftain Odovacar (Odoacer) near Piacenza. The boy Romulus was allowed to abdicate and retire to an estate on the bay of Naples.

Orfino of Lodi

The Ghibelline partisan Orfino of Lodi (c. 1195—c. 1251) was a judge and government functionary in the March of Ancona under the imperial vicars Frederick of Antioch and Richard of Chieti. Orfino is best-known for his Latin poem *De regimine et sapientia potestatis* ("The Rule and Wisdom of a Governor"), a metrically varied treatise of some 1,600 lines. The poem begins with a laudatory history of the Swabian dynasty in Italy culminating in a panegyric on the reigning emperor Frederick II. At lines 280-298 there is a formal exordium, and the remainder, except for a short epilogue, is devoted to a consideration of human nature and to precepts on city governance, with a strong emphasis on law and the courts. The poem is thus a contribution to the usually prose "*podestà* literature" of the period. It was apparently begun in or shortly before 1245 and was transmitted with marginal additions suggesting ongoing revision. It is written principally in leonine hexameters. End-rhyme is frequent and is most often used to form couplets setting off individual maxims; this device is sometimes used more extensively for other special effects. Scattered throughout the work are more than 100 elegiac distichs and three brief "inserts" in different accentual forms.

The anonymous author of *De laude civitatis Laude* ("Laudation of the City of Lodi," in eighty-eight lines, probably written between 1252 and 1259) praises Orfino as one of the city's glories and helps himself to several verses from his predecessor's poem.

Orlandi, Guido

The Florentine poet Guido Orlandi (c. 1264-c. 1333 or 1338; was a member of the powerful Rustichelli family. He began to participate actively in civic affairs c. 1290, and by 1296 he had held several important positions in the city government. After 1296, his name seems to disappear from historical records for some time. We know, however, that he was sympathetic to the Black Guelfs; after their famous expulsion of the Whites in 1302, he commemorated the victory in his sonnet *Color di cener fatti son li Bianchi*. This was an allegiance that lasted at least until 1313, when Guido's name appears on the list of Black Guelfs condemned by Emperor Henry VII. The two additional references made to the poet in extant documents allow us to place his death somewhere between 1333 and 1338.

Orlandi's literary production (three ballads and seventeen sonnets) shows a relatively wide range of influences. As a rule, his poems are conservative in nature and show his indebtedness, both thematic and lexical, to the Sicilian school and the Provençals. Although the effect of the *stil novo* poets is certainly discernible in his poetry (as in *Come servo francato* and *Partire amor nonn-oso*), it is consistently moderated by allusions to and stylistic borrowings from Giacomo da Lentini and the troubadours. Of perhaps greatest interest to literary historians is Orlandi's poetry of correspondence, which accounts, remarkably, for fourteen of his twenty compositions. Among the recipients of these *tenzoni* (nearly all of which are dedicated to the subject of love) were Guido Cavalcanti, Dino Compagni, and Dante da Maiano. The incompatibility of the conventional style of Guido Orlandi and the

innovative ideas of Guido Cavalcanti makes their exchange of sonnets especially interesting. Indeed, it was in response to Orlandi's *Onde si move, e donde nasce Amore?* that Cavalcanti composed the famous *canzone Donna me prega*.

Orlandi Da Pistoia, Lemmo

Very little is known about the life of the lyric poet Lemmo Orlandi da Pistoia (Guglielmo, c. 1260-c. 1294), except that his father was Giovanni di Rolando di Oddo; that he married a certain Sobilia, the daughter of Picchio d'Inghilberto, c. 1278; and that they had two children, Vanni and Frosina.

The two *canzoni* and one *cobbola* (an isolated *canzone stanza*) of Lemmo Orlandi da Pistoia reflect, by and large, the attitudes and themes of the Provençal, Sicilian, and Siculo-Tuscan schools. In the two

canzoni—*Gravoso affanno e pena* and *Fera cagione e dura* (both found uniquely in MS Rediano 9, in the Biblioteca Laurenziana, Florence)—he reiterates his faithful service to his lady and his hope that she will alleviate his physical torment by showing him compassion. In the *cobbola*, *Lontana dimoranza*, he examines the condition of tension in which he finds himself—torn between two differently motivated states of sadness. One cause of grief is the fact that he must dwell far away from his lady; the other cause, equally great, is that once he has returned home, he must depart from her again. In the last two verses—*Così del rimanere/e dell'andare son diverse pene* ("Thus staying and leaving are both painful, each in a different way")—we see how he combines the contrasting states of "staying" and "leaving" to refer both to his own state and to that of his lady, who will also suffer sadness in remaining alone after his departure. One of the four manuscripts containing the *cobbola* (Vatican Lat. 3214) bears the rubric *Lemmo da Pistoia. Et Casella diede il suono* ("Lemmo da Pistoia. And Casella set it to music"). This has given rise to much speculation as to whether Lemmo Orlandi da Pistoia and the Florentine musician Casella (who appears in Canto 2 of Dante's *Purgatorio*) were acquainted. However, we possess none of Casella's music and no evidence, aside from this rubric, of any association between the two.

Orosius

Paulus Orosius was probably born c. 380-385 in the Roman city of Bracara (now Braga) in Hispania (now Portugal). He was a presbyter (roughly equivalent to a parish priest) and seems to have taken a

leading role in fighting heresy in his homeland. In 413 or 414, he traveled to North Africa and met with Saint Augustine concerning the heresies he was fighting. Augustine sent him on to Saint Jerome, who was living in Palestine; there, Orosius became embroiled in a theological controversy with the Pelagians, which he describes in his *Liber apologeticus*. Orosius made his way back to Africa and, at Augustine's urging, wrote his most famous work, *Historiarum adversum Paganos libri vii* (*Seven Books of History against the Pagans*), which presents a universal history from the fall of Adam to Orosius's own day. Orosius was responding—as Augustine responded in Book 3 of *The City of God*—to speculation that the recent sack of Rome at the hands of Alaric's Visigoths had been caused by Christians' abandonment of the pagan gods. Orosius set out to prove that things had actually been far worse in pagan times. He described world history as a succession of four empires: the Babylonian, Macedonian (established by Alexander the Great), African (established by Carthage), and Roman. The vicissitudes of each of these powers reveal the providential hand of God directing history for the benefit of humanity. The establishment of the Christian church, which worked with and within the Roman empire to the advantage of all, is the fruit of this divine ordering of history.

Paulus Orosius, *Historiarum initium ad Aurelium Augustinum*. Venice: Christoforus de Pensis de Mandello, 1499. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Orosius's work was not frequently mentioned in his own day, but it later became very influential. In 494, Pope Gelasius issued a bull that fully endorsed *Seven Books*, and it remained extremely popular throughout the Middle Ages, surviving in more than 200 manuscripts. It provided a model of a universal Christian historiography, and in many instances it proved more popular than Augustine's subtler and less optimistic view of earthly history in the *City of God*.

Orseolo Family

The Orseolo family produced important doges of Venice during the tenth and eleventh centuries. Pietro I Orseolo (r. 976-978) was the only Venetian doge to be beatified by the Roman church. The Venetians chose this saintly man as doge to calm and rebuild Venice after an angry mob had murdered the previous doge, Pietro Candiano IV, and had set fires that burned the ducal palace, San Marco, and 300 Venetian homes. After two years of mild and equitable government, Pietro I abdicated at the urging of Saint Romuald, founder of the Camaldolese order, and secretly left his city, his wife, and his son to become a monk. He spent the rest of his life in contemplation and self-denial in the Benedictine monastery of Saint-Michel-de-Cuxa in southern France. Meanwhile, under his successor, Tribuno Mennio (or Memo), Venetian affairs returned to chaos, from which the city would be delivered by Pietro II Orseolo.

Pietro II Orseolo (r. 991 — 1009), the son of Pietro I, was the true founder of the Venetian state and brought it both internal peace and recognition from foreign powers. He began his reign by making peace

between the feuding families of Venice. He reestablished Venice's commercial relations with the western and eastern empires by treaties with the Saxon emperor Otto III and with the Byzantine coemperors Basil II Bulgaroctonus and Constantine VIII. In 998, he campaigned successfully against Dalmatian pirates (the Narentani) who had terrorized the northern Adriatic for many decades and had exacted tribute from Venice. Pietro II led the Venetian war fleet past the towns of Istria and the Dalmatian coast as far as Zara. When these towns recognized Venice as their protector, he took the title of Duke of Dalmatia. The doge also prevented the Saracens from gaining control of the Adriatic by leading a Venetian fleet to Bari to lift the Saracens' blockade (1002). In Venice, he embellished the ducal palace and chapel, San Marco. Otto III, the young Saxon emperor, admired Pietro II Orseolo so greatly that he was godfather to two of Pietro's children and even visited the doge in Venice, incognito, in the year 1000. The Byzantine emperor Basil II likewise favored Pietro II Orseolo by giving his sister in marriage to John, eldest son of the doge. Otto, the second son of Pietro II, married the sister of Saint Stephen, king of Hungary; their son became King Peter of Hungary (r. 1038-1041). Pietro II Orseolo's reign in Venice ended tragically, with famine and a violent pestilence in which many died, including the doge's eldest son, his Byzantine daughter-in-law, and his grandson. Events of the reigns of Pietro I and Pietro II were chronicled by a contemporary Venetian, John the Deacon, who honored both Orseoli and had participated in their governments.

After the death of Pietro II Orseolo in 1009, his surviving son, Otto, ruled as doge. Otto's executive ability did not equal that of his father or grandfather, and the Venetians expelled him in 1026. Other sons of Pietro II became prominent churchmen of Venice: Orso Orseolo, patriarch of Grado (r. 1013-1040), who served as vice-doge in 1031-1032; and Vitale Orseolo, bishop of Torcello (r. 1013-1048). A certain Domenico Orseolo, of uncertain parentage, briefly served Venice as doge in the summer of 1032. The family became extinct in the twelfth century.

Orsini Family

The Orsini, for centuries rivals of the Colonna for supremacy in Rome, were descended from Orso di Bobone, a nephew of Pope Celestine III (r. 1191-1198). In 1222, Orso's grandson Matteo Rosso I (d. 1246) became the second Orsini senator, and with him began the rise of the family. As leader of the pro-papal Guelfs, he was the first to oppose the Colonna, who appeared on the side of Emperor Frederick II (d. 1250).

In the city of Rome the family's power was centered in the bend of the Tiber River, particularly between the theater of Pompey in the present-day Campo dei Fiori and the mausoleum of Hadrian, both of which were rebuilt as fortresses. In Latium, its power was concentrated to the east and north of Rome. Soon the Orsini were able to acquire from the Angevin kings of Naples fiefs in the kingdom of Naples, although there were also partisans of the Hohenstaufen among the Orsini. Of some eight main lines of the Orsini family, four were also named after their prominent bases of operation.

In 1262, the first division of property in the Orsini family occurred, allowing some insight into the nature of its possessions; in this distribution, Cardinal Giangaetano Orsini (d. 1280) played a significant role. Giangaetano became Pope Nicholas III in 1277; his nepotism was

proverbial and is condemned by Dante (*Inferno*, 19). Several Orsini were entrusted with leading roles in the papal state. Two Orsini—another Matteo Rosso (d. 1305) and Napoleone (d. 1342)—sat in the college of cardinals. Matteo Rosso defended the full authority of the pope, but Napoleone worked to secure broad autonomy in his position as cardinal. Napoleone was one of the most powerful figures in the college of cardinals, to which he belonged for more than half a century, from 1288 to 1342. His political policies were often willful, and in 1305 he had to answer for the fact that the election of a southern Frenchman, Bertrand de Got, as Pope Clement V, which he had made possible, had set in motion the events leading to the removal of the curia to France. However, this absence of the popes from Rome, which lasted for decades, was advantageous to the laymen of the Orsini family, who remained in Rome and were able to enhance their power in competition with the Colonna and associate themselves politically with the Angevin kings of Naples.

In contrast to the Colonna, who were suspected of being Ghibellines, the Guelf Orsini succeeded in protecting their extraordinary position in the papal state and in the college of cardinals; from 1350 to 1405, four Orsini were inducted into the college. The Orsini were also able to adapt to new political conditions in Rome, as is shown by the fact that Cola di Rienzo (d. 1354) found support among them. Giordano di Poncello, from the Orsini line of Monte Giordano, helped Cola militarily and later became rector of the *patrimonium* of Saint Peter. Earl Niccolò of Nola followed Giordano in this office in 1365. The schism of 1378 led to a split within the family, but it also gave the Orsini new opportunities for service as *condottieri*. In later centuries, the Orsini would maintain their prominent position among the Roman baronial nobility.

Orvieto

The town of Orvieto is built on a site of spectacular beauty and considerable strategic value, on top of a stub of volcanic rock, 600 feet (180 meters) above the floor of the valley of the Paglia River. The sheer face of the rock presents a formidable defense against assault. The site also dominates a bridge over the Paglia, on the major road from Rome to Arezzo and Florence. Orvieto's strategic location and probably also its beauty drew the attention of the papacy, and from the mid-twelfth century on, the popes' efforts to strengthen their hold over the Tuscan patrimony of Saint Peter centered in part on Orvieto. In 1157, Orvieto became a self-governing commune within the patrimony. In the thirteenth century, repeated visits from the papal curia made the town an important cultural crossroads. Orvieto faded in importance with the transfer of the curia to Avignon. The town retained its independence within the papal states for almost two centuries; not until 1354 did it give up its liberty and submit to the papal vicar Cardinal Alborno.

Early History

Orvieto's site attracted an urban community at least from the time of the Etruscans. The Romans invaded in 264 B.C. and sent the population off to neighboring towns. The site was inhabited in the Roman and late antique periods, since traces of Roman burials, roads, and a temple complex remain, as do Christian burials from the late third century. The sixth century saw the town's revival. A tiny Christian church was built

in an Etruscan necropolis. A bishopric existed: Gregorius Candido, bishop of Orvieto, is mentioned in three letters of Pope Gregory the Great, dated 590-596. The church of San Severo was founded in the sixth century in the valley below the town and may have been the original episcopal seat. San Severo became a Benedictine monastery in the eleventh century, and perhaps in this period the episcopal seat was moved to its current site on top of the plateau. The town is mentioned in imperial records from 817 as part of Lombard Tuscany, although internal documentation does not begin until 1024.

Bishopric and Papacy

In the twelfth century, Orvietan history centers on the bishopric. The growth of the town's influence is signaled by a series of submissions to the bishop's authority. In the second half of the twelfth century, the bishop was besieged on all sides. There was a long conflict with the canons of San Costanzo, whose possession of the episcopal procuratorship enabled them to exploit the see during a series of long vacancies, particularly in 1161-1168. Episcopal vassals and tenants sought to usurp the bishop's property, often aided by kinsmen among the canons. The Monaldi family probably originated as the bishop's vassals, and in the late twelfth century they effectively exploited episcopal resources; the family came to dominate Orvietan politics and in the early decades of the fourteenth century established *signorie*, lordships over the town. The cathedral was left badly dilapidated at least from 1154 to 1200. The focus of Orvietan worship of necessity was not the cathedral, Santa Maria Maggiore, but the church of Sant'Andrea, on the old forum in the heart of the city that was to become the Piazza Comunale.

Nevertheless, at least from the time of Bishop Rustico (r. 1168–78), the bishops played a growing role in civic politics. When the town's consuls, in February 1170, granted privileges to a civic official called the master of bridges and of the people, the bishop acted with them. In the early thirteenth century, energetic bishops, notably Ranerio (r. 1228-1248), developed systematic forms of administration and record keeping, enabling them to rebuild episcopal resources. In many ways,

civic administration followed their lead.

In 1155, the English pope Adrian IV chose Orvieto for a meeting with Frederick I Barbarossa. Although the plan was forestalled, Adrian in 1157 signed the convention in which the Orvietans formally recognized papal sovereignty. Orvieto achieved a gradual conquest of its *contado* from the twelfth century on, as rural nobles submitted to rule by the bishop and then, after 1168, to the town. These efforts to expand the town's sphere of influence strained relations with the papal curia. A long struggle over strategic lands centered on Aquapendente, the town commanding the bridge where a major north-south road, Via Francigena, crossed the Paglia; and the adjoining Val di Lago di Bolsena, a valuable grain-producing region. Orvieto competed with the papacy and the German emperors to control Aquapendente, and the town changed hands repeatedly. The Aquapendentes periodically rose in revolt against outside rule. Orvieto was placed under numerous papal interdicts during the conflict, beginning with an interdict from Innocent III in 1198. The dispute was not settled until 1297, with Boniface VIII.

Cathar Heresy, the Death of Pietro Parenzo, and the Orvietan Inquisition

In the 1190s, a series of Cathar preachers visited Orvieto and attracted converts. The orthodox feared that the papal interdict of 1198 would embolden the Cathars and appealed to the papacy for help. In February 1199, Innocent III sent a young Roman nobleman, Pietro Parenzo, to serve as papal rector. Parenzo worked energetically to extend papal jurisdiction and combat heresy, notably by imposing large fines, and was soon kidnaped and murdered, purportedly by Cathars. The account of his death, written by a member of the cathedral chapter in an effort to have him canonized, is an important source for early Italian Catharism. A local cult developed, but when Innocent III visited the town in 1216 and preached a new crusade, he refused to canonize Parenzo. Despite efforts to punish Parenzo's killers, the Cathars continued to flourish in Orvieto for several generations.

Duomo, Orvieto. Photograph courtesy of Christopher Kleinhenz.

In the 1230s, Franciscan and Dominican convents were established in Oriveto. The saintly Franciscan healer Ambrose of Massa died in Orvieto, and a cult quickly developed; in 1240, more than 200 Orvietans testified in an inquiry into his miracles. The Dominicans were charged with the Inquisition into heresy in the town. In 1239, Orvietan Cathars responded with violence. A group of men broke into the modest early Dominican convent and gave the inquisitor and other friars a bloody beating. One of the attackers, a civic official named Provenzano Lupicini, was forced by the *podestà* to perform a dramatic public

penance for his part in the attack. Provenzano nevertheless continued to serve in high public office, and as consul he even adjudicated a dispute over episcopal property—strong evidence of the Orvietans' tolerance of their Cathar neighbors. Thirty years later, however, after the town had become closely aligned with the papacy and the Angevins, a Franciscan Inquisition of 1268-1269 sentenced eighty-five people in Orvieto for heresy. They included nine former civic officials and their families, as well as merchants, moneylenders, and artisans, notably furriers. After 1269, Orvietan Catharism faded.

The Rise of the Popolo and Guild Rule

The thirteenth century saw the rise of popular institutions. The popular movement in Orvieto, as in other towns, had a double organization, by profession and by neighborhood. The first mention of guild consuls is in 1214; neighborhood associations played a political role by 1229. A *carta del popolo* (popular constitution) and executives called rectors of the *popolo* were established by October 1244. However, an outsider *capitano del popolo*—crucial to popular organization in larger towns such as Florence—did not appear until 1250. Popular policy reflected the interests of urban guildsmen, petty nobles, and merchants. They protected collective resources, particularly the *beni comunali*, woods, and probably pastures held by the commune in the countryside; and in 1244 they drew up an inventory. They extended the town's power and independence; in these decades a long series of nobles and adjoining communities submitted to Orvieto's authority. Popular public works included, in 1247, repair of the city gates and the construction of an aqueduct as well as the Palazzo del Popolo and its *piazza*.

Local factions headed by the Monaldeschi and Filippeschi lineages formed and became involved in the rivalry between the Guelfs and Ghibellines. After the defeat, in 1266, of Manfred and the imperial cause, Orvieto became loosely aligned with the Guelf and Angevin cause. In 1280, a bipartisan regime was established, led by Raneri della Greca, who served as *capitano del popolo* in 1280-1281 and 1284 and revived the power of council of the *popolo*. Gradually, Orvieto built a stable guild regime that was broad based in comparison with the

regimes of other towns. From 1292 on, the town was governed not by a single *capitano del popolo* but by the *signori sette*, seven executives drawn from the guilds who served six-month terms, advised by a general assembly.

Economic and Social Structure

Even at its peak, c. 1300, Orvieto was a small town, with much of its population closely linked to the countryside. In 1292, there was a *catasto* or household-by-household survey of holdings in rural land that allows a detailed look at the town's economy and social structure. Rural lands were mixed. Arid mountainous areas supported a sylvan and pastoral economy; alluvial lands allowed intensive cereal production and, particularly in the light, fertile volcanic soils of the southwestern portion of the Orvietan *contado*, viticulture. Orvieto is in one of the driest regions of Umbria, and it relied heavily on aqueducts and systems of irrigation. On the basis of the *catasto*, Carpentier (1986, 1993) estimates the urban population in 1292—near the height of demographic expansion—as between 14,000 and 17,000. The population of the *contado*, or diocese, and the district, the town's zone of influence, was somewhere between 19,000 and 32,000. This division between urban and rural populations is artificial, since virtually all residents except small peasant proprietors had urban homes and were assessed as townsfolk. A purely rural nobility did not exist. The vast majority of people listed as country residents were peasant proprietors, with an average holding of a meager hectare and a half (less than 4 acres).

The *catasto* reveals a small hierarchy of great landowners and then a striking majority of modest proprietors: city dwellers with a few plots of land near the town and peasants with tiny holdings. The few old feudal comital families included the counts of Montemarte, a branch of the Aldobrandeschi, and a local house, the Bulgarelli. Eighty households (or "hearths") were headed by men called lords, including dubbed knights, jurists, and former members of the *signori sette*. The average assessed value of their holdings was close to 4,000 *libra* (silver pounds). People described as *the* children of lords, with average holdings at 2,350 *libra*, headed 173 hearths. This 9 percent of the

population owned 55 percent of the acreage owned by townsmen. The counts in particular tended to hold large tracts of low value, including woods and scrub.

Social divisions were indistinct, as urban and rural sources of wealth and status were intermingled. A few of the lords derived from branches of the older comital families, but most were more recent. Lineages such as the Monaldeschi, deriving from twelfth-century landed proprietors, included merchants and jurists by 1292. Only two men called themselves merchants in the tax records; but in fact people who called themselves lords, such as the Monaldeschi and the Miscinelli, demonstrably owned shops and engaged in merchant ventures. One hundred and one hearths were headed by men called masters, including twelve notaries and five doctors, as well as master artisans. They held smaller parcels of valuable land, typically vineyards and plots near the town, and the produce was used for the family table. In all, 246 identifiable artisans appear. A few groups were particularly well-to-do, including the textile and leather trades and the potters, who made the jugs for Orvietan wine. Probably, the prosperity of Orvieto's artisans reflected the presence of the court in the late thirteenth century. In effect, Orvieto included a tiny older landed nobility, a large petty urban elite, and a prosperous artisanate, all with close ties to the countryside.

Influence of the Papal Curia

Orvieto's ties to the popes gave the small town an unexpectedly central role in thirteenth-century affairs. Adrian IV initiated what was to become a long tradition of visits to Orvieto by the papal curia. In the second half of the thirteenth century, the town was a popular residence of the popes, particularly after Urban IV withstood a siege there in 1262-1264. Clement IV was in residence in 1266; Gregory X, in 1272 and 1273; Martin IV, in 1281-1284; Nicholas IV, in 1290 and 1291; and Boniface VIII, in 1297. Their presence gave the town a distinctive character. The popes traveled with as many as 200 salaried officials and retainers, as well as merchants and copyists and the cardinals with their large staffs—perhaps 500 to 600 people in all. Two palaces adjoining the cathedral complex were built to house them, one of these at the town's

expense.

Orvieto became, for a time, a cosmopolitan cultural center. Scholars of the caliber of Hugh of Saint Cher, the geometrician and physician Giovanni Campano, and Albertus Magnus resided there for a time, as did Thomas Aquinas, who became lector at the Dominican convent in 1261. Aquinas became friends with Urban IV and wrote treatises for him, including *Catena aurea*, a commentary on the four gospels that became a source for preachers. Charles of Anjou with his court and garrison visited in 1268 and 1289. Saint Louis was canonized in the church of San Francesco in 1297.

Patronage from the curia attracted great artists, including Arnolfo di Cambio, who carved the tomb of Cardinal Guillaume de Braye for the Dominican church, as well as the Sienese architect Lorenzo Maitani. Orvieto's superb cathedral was planned beginning on 22 June 1284. In 1290, an agreement between the cathedral chapter and the papal chamberlain called for the church to be built "in the likeness of Santa Maria Maggiore," the great Roman basilica reworked under the patronage of Pope Nicholas IV. Nicholas laid the foundation stone in Orvieto on 15 November 1290. The building was initially constructed between 1290 and 1309, when Lorenzo Maitani took over the project. The reliefs on the facade, depicting the *Creation*, *Tree of Jesse*, *Life of Christ*, and *Last Judgment*, are the work of Maitani. The plague of 1348 greatly reduced the workshop; building continued until 1600

Miracle at Bolsena and Corpus Domini Feast

Urban IV instituted the universal Corpus Domini feast in Orvieto in 1264, perhaps in response to the "miracle at Bolsena." A Bohemian priest—called Peter of Prague in Orvietan tradition troubled by doubts over the eucharist, stopped in Bolsena on his way to see the pope in Orvieto. When he performed a mass and consecrated the host, the altar cloths dripped blood, a miraculous vindication of the doctrine of transubstantiation. The documentation for the miracle is late, and scholars have questioned its date and its actual connection to the feast, which originated in the intense eucharistic piety of the early Beguines in Liege. Recent research has shown that a Bohemian protonotary

named Peter of Prague did visit Urban in Orvieto in 1264; this strengthens the case for dating the miracle at Bolsena to that year. If so, the pope probably instituted the feast when he had the relics translated to Orvieto. Thomas Aquinas may have composed the Corpus Christi liturgy at the pope's request. In the early fourteenth century, a chapel was built in the cathedral to house the relics and was frescoed with tales of eucharistic miracles. The feast was celebrated with a public procession and, from 1325 to 1330, with a theatrical performance of the miracle by the confraternity of the *disciplinati* of San Martino.

Fourteenth-Century Signorie and Decline

In the early fourteenth century, Orvieto—like many towns in central Italy—fluctuated between broad-based oligarchy and domination by *signori*, strongmen. In the first decade of the century, internal politics were tranquil, though the town engaged in a long struggle for control of the Val di Lago and the lands of the Aldobrandeschi counts. Factional wars were sparked in part by the Italian venture of the German emperor Henry VII. The Orvietan Guelfs triumphed in 1313, exiled their Ghibelline opponents, and destroyed the Ghibellines' urban property; contemporary accounts speak of a whole neighborhood in ruins. The new regime substituted "the Five" (*cinque*) for "the Seven" (*signori sette*); these offices were dominated by the Guelf nobility, particularly the Monaldeschi. Disastrous foreign policies and the threat of a popular rebellion led in 1315 to a reinstitution of the *signori sette* and the last popular regime, with Poncello Orsini serving as captain in 1315-1317 and 1321. In 1322, the Monaldeschi took over; there was a brief popular resistance and then, in 1334, the establishment of a *signoria* by Ermanno di Corrado Monaldeschi. Ermanno's death in 1337 led to a long period of political instability as several factions, including four competing branches of the Monaldeschi, struggled for control. A final brief period of Ghibelline rule under Siennese auspices led to war in 1346. The famines, plague, and fiscal problems of the late 1340s fostered a new reliance on *balie*, commissions with extraordinary powers overriding the constitutional system. In 1354, Cardinal Albornoz led a papal reconquest of the patrimony. Orvieto for a short time was

involved in the efforts of the Prefetti di Vico to resist but then submitted to papal rule. When the council voted to appoint Cardinal Albornož ruler of Orvieto for life as the pope's vicar, according to a contemporary source, "each and every council member" remained seated in indifference.

After its loss of independence, Orvieto suffered badly during the intermittent wars of the Great Schism. The town was initially held by Urban. In 1380, it was sacked and burned by Breton mercenaries; more than 3,000 Orvietans were killed, and hundreds of houses were burned. Forces of the Avignonese pope Clement VII held the town until it was briefly regained by Rome in 1390, after a siege during which, according to a chronicler, the town's population dropped to 500 and ate mice to survive. It was recaptured by Clement's forces and held until 1398, when it passed to Pope Boniface IX. Orvieto remained under papal control, though the town was briefly lost to Ladislao of Naples in 1414 and was then ruled on behalf of the papacy by the *condottiere* Braccio da Montone from 1416 to 1419. In 1292, the town had included nearly 3,000 hearths; by 1397 the number had dropped to 1,000.

Ostrogoths

The Ostrogoths entered the historical record at the end of the third century under the name Greuthingi, as just one of several groups that Roman sources noted as attacking along the lower Danube. However, the Ostrogoths never developed a refined sense of territoriality or ethnicity; instead, their political evolution, which necessarily preceded territorial definition, was directed toward the imperial systems of Roman and Hunnic origin. The troublesome *Historia Augusta*, from the late fourth century, equates the third-century Greuthingi with the Ostrogoths, who by then had developed into a major confederacy of Gothic-speaking peoples. Ammianus Marcellinus, writing c. 395, called them Greuthingi and recorded the suicide of their heroic king Ermanaric, the subject of many sagas, who killed himself rather than lead his people under Hunnic domination. Sixth-century sources sometimes referred to them as Ostrogoths, but just as often merely as Goths. The Ostrogoths continued to welcome others into their families and society from the earliest period until they are lost from the records. The beginnings of this process of ethnic formation are part of the Gothic hegemony within the so-called Cherniakhov civilization centered on the Ukraine.

Ermanaric's fears about Hunnic domination were realized, but not as anticipated. The leading families of the Ostrogoths as well as those of other Gothic-speaking groups became the second ruling class of the Hunnic empire. In this environment the Amali family and those allied to it through marriage or obligation fared well. In 454 many Ostrogoths joined the Gepids in defeating the Huns following the death of Attila, whom they had served faithfully. In the next year the Amali sought and received imperial permission to settle in those parts of Pannonia now in northeastern Yugoslavia under three brothers: Valamir, Vidimir, and Thiudmir—father of the most important of all Ostrogothic rulers, Theodoric the Great.

At this time the empire was attempting to stabilize the eastern Balkans by the direct recruitment and settlement of many different groups of barbarians. The Ostrogoths were settled not in three contiguous areas but in three zones with other groups. Other groups of

Ostrogoths, not tied to the Amals, followed their leaders directly into Roman service elsewhere in the Balkans, notably those following Theodoric Strabo. The result of these settlements and recruitments was about a quarter-century of struggle among the Ostrogoths themselves and with the Roman empire. In 489-490 this phase of Ostrogothic history ended, when Emperor Zeno invited Theodoric the Great to lead his people into Italy and remove Odovacar (Odoacer).

The Ostrogoths under Theodoric's leadership achieved the highest level of cohesion and unity of purpose that they were ever to know. Their population rose to 75,000-100,000, and most adhered to Arian Christian beliefs, which emphasized the dominant role of the God the father within the Trinity. Most lived in Picenum or in the vicinity of Ravenna, where they were accorded the privileges of *hospitalitas*, typically a sharing of a combination of landed estates and their revenues. At least in their capital, Ravenna, now accorded equal status with Rome on some of the coinage minted during their rule, Arian churches and the Arian baptistery were the focal points of their identity and culture. However, there remained virtually no aspect of the Ostrogoths' life that was not in some way influenced by their long association with Roman civilization. This was as true for their items of personal dress and symbols of rank and power as for their mechanisms of government, even among themselves. Marriage to Romans, although forbidden, occurred, as did conversion to Orthodox Christianity, tolerated but equally discouraged throughout their years of rule. For the most part, the Ostrogoths continued the evolutions begun in the context of their experience with the Roman frontier, but with certain families—strengthened by their role in the Hunnic empire—playing a leading role.

Predictably, the Ostrogoths dominated the military, but Romans did serve there as well, especially during the war against Justinian. Theodoric issued laws, *edicta*, in his own name to govern all the people, Goths and Romans, of the Italian dioceses and some areas beyond. Some Ostrogoths, though not many, lived in garrisons in the outlying areas. Civilian government remained separate from the military except in frontier areas and was left in the hands of the Roman upper classes (*honestiores*) with whom the elite Ostrogoths shared power and many attributes of daily life. Ostrogothic noble families were able to establish

strong bases of local support even under Theodoric and grew even more dominant under his successors, especially his weak grandson Athalaric (r. 526-534). They deposed Theodahad (r. 535-536) without difficulty. The poorer Ostrogoths, despite the support of the monarchy and despite the special privileges that came with their military obligations, gradually merged with the Roman tillers of the soil. Most never truly became just other members of the Roman *humiliores*, primarily because of their annual military donatives and their occasional access to the king. However, this fate befell some of them at least within a decade of the collapse of their independent kingdom in 554.

The end of the Ostrogothic kingdom was but a part of the Emperor Justinian's attempts to reconquer the "lost" western provinces of the empire. By 537 his leading general, Belisarius, was marching on Rome, which suffered several sieges before the final battle of this twenty-year struggle. Internally, this war was at least in part precipitated by the collapse of the Amali line within a decade of his death. Although Theodoric's central vision of an Ostrogothic identity within the empire survived his line, it did so only as a rallying call for those who regarded Justinian's armies as invaders. King Totila (r. 541-552) in particular seems to have tried to evoke the visions of equipoise associated with Theodoric, but he failed both in society and on the battlefield, where he fell against Belisarius's successor, Narses. Most Ostrogoths simply merged with the indigenous populations of Italy— some left Italy forever; others served in the armies of Rome in the east; and after 568 some married into the Lombard aristocracy. The Ostrogoths under Theodoric were the most successful and tolerant of the first generation of Germanic kingdoms and arguably the most Romanized.

Otranto

Otranto, the southernmost city on the Adriatic coast of the "heel" of Italy, took its ancient name—Hydrous (Greek), or Hydruntum (Latin)—from the river now known as the idro, on which it is located. (To the present, its citizens call themselves *idrunтини*.) It gives its name today to the Strait of Otranto, at the virtual mouth of the Adriatic. Otranto may have been a Cretan Greek colony or may have been a colony of nearby Tarentum (Taranto). It acquired early importance as the most logical port connecting traffic between Italy and Greece. However, it was bypassed by the Via Appia connecting Taranto and Brindisi, and its importance diminished after Brindisi was developed as the Romans' port of choice. The extension of the Via Appia-Traiana to its terminus at Otranto in the early first century after Christ did renew something of Otranto's importance as the closest Italian port to Epirus (present-day Albania). Nevertheless, it remained overshadowed by Brindisi and became a relatively small backwater, of which little is documented before the sixth century.

During the Gothic wars attending Justinian's program of reconquest, Otranto held out against Totila, even at the height of the Ostrogoths' recovery, serving as an important imperial base. Unlike many other areas of Byzantine Italy, Otranto long resisted the Lombards' attacks,

thanks partly to its isolation. It was the seat of a Greek bishopric, was the administrative center of its district (*terra d'Otranto*), and remained stubbornly Byzantine in culture and population. At some point early in the eighth century, the Lombards succeeded in occupying it, and it was used by the dukes of Benevento in their hostilities with the Lombard king Desiderius. Nevertheless, the Byzantines soon recovered it (758) and made it their substitute capital for what was left of their Italian holdings following their loss of Ravenna.

Otranto maintained that status until 976, when the Byzantines regained Bari, which became the new administrative and military capital. Otranto continued to be an important Byzantine naval port, however, as well as a center of trade between the Byzantine east and the Adriatic and southern Italian districts. By way of further compensation, the city's episcopal see was made into an autocephalous archbishopric, the only one in southern Italy; and in the tenth century, it was further elevated to the status of a metropolitan, dependent solely on the patriarch of Constantinople. These steps acknowledged the profoundly Orthodox spirit and Greek culture that continued to characterize the city, despite an increasingly cosmopolitan population. Not until 1067 did the city begin to accept Latin archbishops, and much of the clergy remained Greek for some centuries thereafter.

In 926, Otranto was attacked by a Saracen fleet that was driven off only because a disease spread among the attackers. There were renewed Saracen assaults in 950 and 977, in the course of which disaffections and dissent between the local population (now more "Lombardized") and the Byzantine officials became more open. Weak in the face of the first serious Norman offensives, the city was forced briefly, in the late 1040s, to pay tribute to the Norman count Unfred, and it suffered brief occupations by the Normans in 1055-1060 and 1064. Otherwise, Otranto was joined with Bari and Taranto to form a defensive triangle as a final base of resistance to the Normans. The triangle cracked when, after a prolonged beleaguerment by land and sea, Otranto fell to Robert Guiscard. He then used it as his base for completing the process three years later with his decisive capture of Bari and secure reduction of the remaining Adriatic coast of Puglia.

Robert Guiscard's rule was not initially welcomed, and Otranto was in rebellion against him in 1085 when he died and his son, Bohemond,

retook the city by storm. Generally, however, the Norman era, like the Hohenstaufen era that followed, was a prosperous time for Otranto, which was ruled by its own Greek governor. Otranto was an important naval base for the Normans, and its merchants traded actively with Constantinople, Venice, and other merchants from all over Italy and the Adriatic regions; it also served as a port of embarkation for crusaders and pilgrims, parallel with Brindisi.

By the mid-thirteenth century, the rulers of southern Italy seemed less and less interested in their Apulian territories, and disaffection was further inflamed by the transition into the Angevin era. Otranto turned against the heirs of Frederick II and was seized first by Conrad and then, again, in 1255, by the Saracen forces of Manfred. Its loyalties were tossed about in the Angevin dynastic wars. Otranto was occupied in 1348 by Louis the Great of Hungary. Finally, in 1464, it submitted to the Aragonese.

Otranto's decline was signaled dramatically when, With the help of some Italian allies, the Ottoman Turks of Sultan Mehmed II took the city in August 1480, after a fifteen-day siege, and massacred the surviving inhabitants. The fear that this would initiate a Turkish conquest of all Italy was allayed the following year, when the sultan died; and the city was quickly recovered by Alfonso of Aragon, though it suffered a brief occupation by Venice in 1484. Otranto was happy to accept Aragonese rule but received a dubious reward when Ferdinand of Aragon used it as one of his debt pledges and briefly turned it over to the Venetians (1496). Otranto was restored to the Spanish after a final seizure by the Venetians (1528) and then slipped into a long period of decay. Thereafter, only a literary quirk drew attention to it: after recovering the city from the Turks in 1481, Alfonso of Aragon built a strong new defensive fortress (1485-1498), which provided the title for Horace Walpole's famous Gothic novel, *The Castle of Otranto* (1764).

Besides that late structure, the city's chief medieval monument is the cathedral, dedicated to Santa Maria Annunziata. The crypt was begun by the Normans in 1080, and the structure in general was completed in the later twelfth century. Its nave and aisles still preserve an unusual pavement mosaic of 1163-1165. The church was badly damaged by the Turks in 1480 and extensively restored and refurbished thereafter. In the south transept there is a Cappella dei Martiri, a shrine to the tragedy of

1480. In it, along with the decapitation stone, are preserved bones representing some 500 citizens who, refusing to renounce their faith, were slaughtered by a Turkish executioner—who, moved by their devotion, professed Christianity himself and was executed in his turn. The crypt contains interesting column capitals and fresco fragments from various periods.

Near the cathedral is a scant survival of Otranto's Byzantine era, the little church of San Pietro. Built in the tenth and eleventh centuries, on the Byzantine plan of a Greek cross with barrelvault ceilings in the arms and a central cupola, it is thought possibly to have been the city's earlier cathedral. In its interior are some interesting Greek inscriptions and frescoes. In the suburb to the southeast of the city center, there survives also the church of San Nicola di Casole, part of a Greek monastery founded in 1099. The church itself dates from the twelfth century. It was rebuilt after the Turkish devastation of 1480 but still retains elements of its original interior decoration, and it is noteworthy for its association with its twelfth-century abbot, Nicholas of Otranto. Nicholas, a distinguished scholar and patron of Greek manuscript production, is symbolic of the city's long-lived Hellenic traditions.

Ottava Rima

Ottava rima is a strophe composed of eight eleven-syllable lines. At one time, Giovanni Boccaccio was considered the "inventor" of *ottava rima*, but that assertion is simplistic and problematic, and various revisionary hypotheses on its origin have since been put forth. Its antecedents were most likely part of a current of French and Provençal lyrics flowing into Italy via the southern kingdoms of Sicily and Naples. Certain French and Provençal examples of eight-line stanzas are datable to the late thirteenth century. There is also documented evidence suggesting that the Sicilian octave (abababab) had developed out of French troubadour poetry by the late twelfth century. The eight-line unit itself may have originally been part of a longer poetic form such as the *canzone*.

If Boccaccio did not invent the octave, his historical contribution is, however, undisputed, for he elevated the form to its definitive artistic level with two early works: *Teseida* (c. 1335) and *Filostrato* (c. 1340-1342). Boccaccio probably became acquainted with the octave at the brilliant Angevin court in Naples during a sojourn he made there from c. 1328 to 1340. On returning to Florence, he would have transported the octave to Tuscany. Indeed, the form most widely used in Italian verse of subsequent centuries, rhymed abababcc, is traditionally called the Tuscan octave. Despite this name, a few French exemplars (datable c. 1300) remain for this type as well, and it was also found at the Neapolitan court. It is also important to note that the so-called Tuscan octave was used in many regions of Italy in the ensuing periods.

Metrically, the octave is extremely flexible, and it is useful for expressing a variety of tones (serious, amorous, comic, satiric), modes (narrative, discursive), and registers (lyric, epic, sacred drama). Its language also runs the spectrum from elevated to colloquial. Suitable for any subject matter, a single octave is long enough to present a complete description or idea, yet short enough to be clear and efficient. The potential of the octave for elegant expressivity and fluidity is demonstrated by the fact that a syntactic period can extend through an entire strophe, or even into a second one. On the other hand, the rhythm of many early examples is frequently fragmented and "choppy,"

being composed of couplets (2 + 2 + 2 + 2), while enjambments are almost unknown. Owing to its adaptability, the octave has been exploited throughout the centuries and by poets of different nationalities.

In the fourteenth century, the octave was most widely used in *cantari*, many of which had as their subjects the heroic narratives of the "Carolingian material." In the fifteenth and sixteenth centuries, the octave was adopted by major poets, who expressed their individualistic voices by applying various "reforms" and experimental adaptations to this versatile meter. Masterpieces of Italian literature composed in octaves include Pulci's *Morgante*, Poliziano's *Le stanze per la giostra*, Boiardo's *Orlando innamorato*, Ariosto's *Orlando furioso*, and Tasso's *Gerusalemme liberata*. Lorenzo de' Medici should also be remembered for his experiments with many dimensions of the octave, and especially for his effective use of enjambment, which would inspire both Boiardo and Ariosto. Many studies have been devoted to the balance and symmetry of the Ariostean octave, which harmoniously matches content and meter and exploits the internal rhythms of the stanza for ironic effect. Following the Italian models, Spanish and Portuguese poets of the Renaissance used the octave in their epics. Its English equivalent maintained the abababcc arrangement, although iambic pentameter was substituted for the Italian eleven-syllable line. The octave flourished in the Renaissance, being well suited to epic poems, and it was still in use by some Italian poets as recently as the nineteenth century and the early twentieth century.

Otto I

Otto I (912–973) was duke of Saxony, king of Germany (from 936), and emperor (962-973). Saxony was one of five major regional "duchies" (probably tribally based) into which the northeast and north central portions of Charlemagne's empire— what would later become Germany —broke up, the others being Bavaria, Franconia, Swabia, and Lorraine. Otto's father, Henry the Fowler, had obtained the title of king and a vague suzerainty over the other four dukes. But Otto succeeded in making his rule factual as well as theoretical throughout Germany.

Adelaide, widow of Lothar, king of "Italy" (actually northern Italy), appealed for Otto's help in averting a forced marriage to Adalbert, son of Berengar, a northern Italian warlord. In 951, Otto, himself a widower, descended on Italy, married Adelaide, and forced Berengar into a kind of vassalage. Troubles in Germany kept Otto away from Italy through the rest of the 950s. A renewed opportunity for intervention came in 961, when Pope John XII appealed for help against Berengar, who had reasserted his independence in Otto's absence. Otto stepped in and rescued the pope, who in turn gratefully crowned Otto emperor in February 962. But relations between the two cooled quickly, and Otto

installed his own papal candidate, Leo VIII. The situation was resolved by John XII's death in 964.

Otto left Italy in 965 but returned the following year to put down a rebellion in the city of Rome. In 967, Pandulf ("Ironhead"), duke of Capua-Benevento, became Otto's vassal. The expansion of Otto's power into southern Italy sparked resistance from the Byzantines. After he failed to take the stronghold of Bari in 968, Otto sought better relations with the Byzantines by forming a marriage alliance negotiated through Bishop Liudprand of Cremona, who knew Greek and was also one of Otto's strongest supporters in Italy. Liudprand's first embassy in 968-969 was unsuccessful. But the negotiations eventually bore fruit when Theophano, a kinswoman of the Byzantine emperor John I, Tzimiskes, arrived in Italy in 972 and married Otto's son, Otto II, in April of that year. Otto returned to Germany, where he died in May 973.

Otto can be considered the first ruler of the Holy Roman empire, though that term was not used until the twelfth century. His involvement in Italy was criticized by historians in the nineteenth century and the early twentieth century, but more recent scholars have noted that one should not read the troubles of the late eleventh, twelfth, and thirteenth centuries back into earlier times. Otto had little choice but to intervene in Italian affairs. Two other German dukes—Henry of Bavaria and Ludolf of Swabia—had already been meddling in northern Italy. Otto's Italian policy was a sound one for his time.

Otto II

Otto II (955-983) was duke of Saxony; king of Germany (from 961); co-emperor with his father, Otto I (from December 967); and sole emperor on his father's death in 973. During much of the early part of his reign he was taken up with troubles in Germany, Bohemia, and Lorraine, which he generally settled successfully. In late 980, Otto II was at last able to go to Italy. But after some initial successes, an expedition against the Saracens in southern Italy went awry, resulting in a disastrous

defeat near Stilo in July 982. Otto was able to escape to a Byzantine ship by concealing his identity. Otto II died in Rome in December 983; at the time of his death he was campaigning against Venice, was planning a fresh offensive against the Saracens, and had secured the election of his nominee (Peter, bishop of Pavia) as Pope John XIV.

Otto II had married a Byzantine noblewoman, Theophano, in 972. Earlier scholars viewed this marriage as an attempt by his *father*, Otto I, to develop better relations with the Byzantine (eastern Roman) empire. This is true, but recent social historians have also noted that the church had tightened the law against incest c. 875, and that the higher nobility in western Europe attempted, conscientiously, to follow the new regulation. As a result, many western royal houses looked far outside their own circles for marriages. This may have been an important secondary reason for the marriage of Otto II and Theophano.

Historians consider Otto II to have been energetic and ambitious, but not as gifted a ruler as his father. He was succeeded as emperor by his son, Otto III.

Otto III

Otto III (980-1002) was the son of Otto II and Theophano; in 984, at age four, he succeeded his father as king of Germany. The child had two able regents in his mother and Adelaide, the widow of Otto I. Theophano, like her husband, died young (June 991), but Adelaide continued as regent.

Otto crossed the Alps and was crowned Roman emperor on 21 May 996 by his cousin Bruno, whom Otto had appointed as Pope Gregory V. When Otto returned to Germany, he learned that Gregory had been driven from Rome by John Crescentius, a local warlord styling himself patrician of the Romans. Cres-centius enthroned a new pope: John Philagathon, archbishop of Piacenza, who assumed the name John XVI.

Otto reentered Italy, took Rome, executed Crescentius, blinded the wretched John XVI, and restored Gregory V. Otto then advanced triumphantly into southern Italy, where many local rulers did him homage. On Gregory's death, Otto returned to Rome and appointed Gerbert, a former tutor, as pope; Gerbert took the name Sylvester II.

Otto built a palace in Rome and revived many old Roman customs and titles. Returning to Rome after a tour of central and northern Europe in the summer of 1000, he faced a revolt of the citizens that forced him to leave. He died on 23 January 1002 while campaigning against the Romans.

Otto III. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle).
Nuremberg: Anton Koberger, 1493, p. 182r.

Scholarly judgment of Otto has been divided. He was possessed of great intelligence, but his political abilities have been questioned. Some scholars criticize Otto III for (like his grandfather) neglecting Germany in favor of Italy. Others note that because of his youth, his role in government was limited even after he attained his majority. But he had capable advisers, and his appointments of German officials were shrewd. Otto's visits to Prague and Aachen (where he visited the tomb of Charlemagne) in 1000 indicated that northern and central European questions were still very much on his mind. His death at age twenty-one left his true abilities forever a mystery.

Ovid

The Latin poet Ovid (Publius Ovidius Naso, 43 B.C.-A.D. 17 or 18) was born into an affluent family of equestrian rank in Sulmo (modern

Sulmona) in the Apennine region, east and slightly north of Rome. After an early education in Sulmo, Ovid was sent at age twelve to Rome to study rhetoric and to prepare for a career in law and politics. Rome was then beginning to flourish under the emperor Augustus, and the capital gloried in such great poets as Virgil, who was composing the *Aeneid*; Horace, who was writing odes; and Propertius and Tibullus, who were fashioning their elegies. For Ovid, who—to his father's chagrin—had shown an early predilection for poetry, the lure of a literary life proved to be much stronger than the attraction of public office. He began reciting his poems in public and cultivating acquaintances among the literary elite. He soon established himself as a leading wit of Roman society and became known to the emperor. Ovid married three times and considered himself an expert in affairs of the heart and in women's ways. In A.D. 8, for a now obscure reason ("a book and an indiscretion," according to Ovid), Augustus expelled him from Rome and banished him to Tomis, a bleak outpost on the Black Sea. The exiled Ovid, sad and forlorn, died there a decade later.

Ovid, *Libri de arte amandi et de remedio amoris*. Toscolano: Alexandri Paganini, 1526. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Ovid's extant poetry falls into three categories: early, or erotic; mature, or mythological; and "exilic." The erotic poems are as follows: *Amores* (*Loves*), his earliest published work, consisting of some fifty short poems, many of which praise the pseudonymous Corinna, perhaps a symbol of several mistresses; *Epistulae heroidum* (*Heroides* or *Epistles from Heroines*), fifteen-verse letters presented as messages from famous women (all but one of whom are legendary) to the men they

love; *Ars amatoria* (*Art of Love*), a treatise to men on how to find, win, and keep a woman; *Remedia amoris* (*Cures for Love*), on how to cure lovesickness; and *Medicamina faciei feminae* (*On Facial Treatment for Ladies*), ironic instructions on how young women may make themselves *beautiful* and attractive to men. The mythological poems include Ovid's most prized work, *Metamorphoses*, a fifteen-book epic that brilliantly weaves scores of myths into an almost unparalleled literary tapestry; and *Fasti* (referring to the Roman calendar), an incomplete poem in six books of myths, legends, rites, and events that correspond to the days of the year from January to June. The exilic poems include *Tristia* (*Sorrows*), a markedly autobiographical work in five books detailing the hardships Ovid endured during the first five years of his exile; *Ibis*, an invective against an anonymous person (referred to as Ibis) who betrayed Ovid; and *Epistulae ex Ponto* (*Epistles from Pontus*), forty-six poetic letters in four books written from the Black Sea to Roman friends.

In the history of classical Latin poetry, Ovid is second only to Virgil in overall significance and literary influence; and in western letters Ovid is perhaps unsurpassed as a teller of tales. Although he composed verse primarily to delight, rather than to convey lofty principles, his works had considerable influence on Christian writers and artists of the medieval, Renaissance, and baroque eras. During the Middle Ages, his *Metamorphoses* served as the most popular and readily available handbook for mythology, and medieval commentators often interpreted the tales in a moralized or allegorical fashion.

Ovid in the Middle Ages

During the Middle Ages, countless Christian authors studied, imitated, allegorized, and incorporated into their own work the writings of the Latin Augustan poet Publius Ovidius Naso, known more commonly today as Ovid. The *Metamorphoses*, the poet's *magnum opus*, achieved such popularity that medieval scholars referred to it simply as *Ovidius maior* (in Italian, *Ovidio maggiore*) to distinguish it from his minor works, such as *Fasti* (*Roman Calendar*) or *Ars amatoria* (*Art of Love*). Some favorite Ovidian characters—such as Narcissus, Philomena, and Pyramus and Thisbe—inspired autonomous, often anonymous, narratives. More generally, Ovid provided detailed myths, well-defined characters, lyrical images, and literary models to which medieval authors could easily refer. Certainly the history of Ovid's influence, often referred to as his *Nachleben* or his *fortuna*, is long and complex as it relates to the Middle Ages and is best considered as a continuum that stretches from late antiquity to the Renaissance.

Ovid, *Metamorphoseos vulgare*. Milan: Per Rocho & Fratello da Valle ad instantia de Miser Nicolo da Gorgonzola, 1520. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

Although scholars have traced Ovid's influence to distinguished post-Augustan poets, including Lucan and Statius, and have uncovered quotations from Ovid even in lowly Pompeian graffiti, the study of Ovid in the late Roman empire continued perhaps most notably and most systematically in schools of rhetoric. As the empire decayed and Christianity burgeoned, Christians also studied Ovidian texts and were

either repelled (as Saint Augustine and Gregory the Great were) or intrigued. In the early fifth century, Prudentius, the "Christian Ovid," in his antiheathen tract *Contra Symmachum*, used descriptive Ovidian passages; and much later in that century, or early in the sixth century, Fulgentius Planciades in his *Mythologiae* quoted both *Metamorphoses* and *Fasti*. Lactantius Placidus, in the fifth or sixth century, summarized tales from the *Metamorphoses* in his *Narrationes fabularum Ovidianarum*. Much later, in the eight or ninth century, Theodulph, bishop of Orleans, justified his use of Ovid's erotic poetry in an often-quoted couplet (*Patrologia Latina*, 105.331): *In quorum dictis quanquam sinfrivola multaj Plurima subfalso tegmine vera latent* ("Although in these writings there may be many frivolous things, many truths lie hidden beneath a false covering"). From about the tenth century, Goliardic minstrels—forerunners of the troubadours and minnesingers—began unabashedly incorporating Ovidian characters and images into their love poetry.

Notwithstanding the manifold uses of Ovid in the early Middle Ages, he remained largely a marginal author until about the eleventh century, when monks began regularly including his works in their curricula. Many scholars now hold that Ovid's influence during the Middle Ages peaked in the twelfth and thirteenth centuries—a period of such intense study and such widespread production of manuscripts of Ovid that Ludwig Traube called it *aetas Ovidiana*. But Ovid was also highly esteemed during the fourteenth century. For example, Dante exalted Ovid as one of the virtuous pagans in Limbo (*Inferno*, 4.90) and referred to Ovid by name fourteen other times in various works. More important, Ovid's characters and images served as sources for numerous episodes in Dante's *Commedia*. Similarly, Boccaccio's *Filocolo* resounds with Ovidian echoes, and Petrarch's *Canzoniere* abounds in allusions to such popular Ovidian myths as that of the god Apollo in pursuit of Daphne.

As for Ovid's allegorizers, in the mid-twelfth century Arnulph of Orléans composed *Allegoriae super Ovidii Metamorphosin*, the first major, albeit brief, commentary on the *Metamorphoses*. Arnulph's allegorical reading reinforced a pattern for the many moralized interpretations that followed. In the early thirteenth century Albrecht von Halberstadt wrote a German commentary on the *Metamorphoses*

(this commentary, in rhymed couplets, is only partially extant). Another notable allegorization of Ovid's major work, also from the thirteenth century, is the grammarian John of Garland's *Integumenta super Ovidium Metamorphoseos*, in 260 elegiac distichs. Other thirteenth-century commentaries include *Versus Bursarii Ovidii* (on most of Ovid's works) and *Liber Titan* (on *Metamorphoses*). In the early fourteenth century, Giovanni del Virgilio, a correspondent of Dante, composed *Allegoriae librorum Ovidii Metamorphoseos*.

Common to most of these and later Ovidian commentaries was a desire to make Ovid's often lascivious or risque tales acceptable to the Christian reader. To accomplish this lofty goal the interpreter had to read Ovidian episodes in as imaginative or figural a manner as possible. Just as the evangelists (and later the church fathers) had interpreted events in the Old Testament as prefiguring events in the New Testament, the moralizing readers of Ovid specialized in uncovering hidden Christian meanings in blatantly pagan and even erotic episodes. The innovative work of these Ovidian interpreters paralleled that of biblical commentators on the amatory *Song of Songs*.

The most detailed and most famous medieval interpretation of Ovid is *Ovide moralisé*, an anonymous moralization sometimes attributed to Chretien Legouais. Composed in French in fifteen books in octosyllabic couplets, most likely between 1316 and 1328, *Ovide moralisé* paraphrases and moralizes each book of the *Metamorphoses*. For example, the serpent Python, representing Satan, is slain by Apollo, symbol of Christ; Tiresias, a Theban seer, stands for the ancient prophets; Phaethon, son of Apollo, represents the Antichrist; Jupiter's rape of Europa prefigures Christ's descent from heaven to save mankind. This moralized version of Ovid proved so popular and influential that it too was summarized, for example in the fifteenth-century *Ovide moralisé en prose*.

Another popular medieval reading of the *Metamorphoses*, from the second quarter of the fourteenth century, is Pierre Bersuire's *Ovidius moralizatus*, consisting of most of Book 15 of the Benedictine Bersuire's *Reductorium morale*. Other moral interpretations of Ovid from the fourteenth century include the Dominican Robert Holkot's *Moralia super Ovidii Metamorphoses* and Giovanni dei Bonsogni's *Allegorie ed esposizioni delle Metamorphosi*.

To limit the role of Ovid in the Middle Ages to that of *Ovidius theologus* ("theological Ovid"), however, would be to focus primarily on *Metamorphoses* and not to tell the whole story of Ovid's pervasive influence. Although many medieval commentators focused on mythography and *Ovidius maior*, others perceived the poet as *Ovidius medicus* ("medical Ovid") or *Ovi-dius magus* ("magical Ovid"). Ovid functioned as a medical adviser through his *Remedia amoris* (*Cures for Love*), which served as a textbook for such medical scholars as Arnold of Villanova (1240-1311). Ovid was perceived as a magician chiefly in legends that flourished in and around Sulmona, where he was born. Many of these legendary tales concerning Ovid parrot or at least parallel earlier tales of Virgil as magician or prophet.

P

Pacino di Bonaguida

The Florentine painter and illuminator Pacino di Bonaguida (fl. before 1303-c. 1330s) became a leading exponent of what Offner (1923, 1987) described as a "miniaturist tendency" in Florentine painting of the early *Trecento*. This tendency was prevalent in small-scale panel painting rather than monumental mural art and is characterized by a spirited approach to narrative, keenly observed anecdotal detail, and a shift toward decorative abstraction. To judge from the number of works attributable to Pacino, he commanded a successful workshop, which by 1330 appears to have been the busiest and the most significant center for the execution of manuscript illumination in the city, especially for copies of the works of Dante Alighieri. Pacino's only surviving signed painting is the *San Firenze Polyptych* (c. 1315-1330; Florence, Accademia), which has been crucial in establishing his artistic personality as well as for building up the not inconsiderable corpus of work linked to him or his *bottega*. Pacino is first mentioned in 1303 in connection with the painter Tambo di Serraglio, with whom he dissolved a partnership established in the preceding year; he is documented for the last time c. 1330, when he enrolled in a Florentine guild, the Arte dei Medici e Speziali.

Among Pacino's earliest works is thought to be the *Tree of Life* (c. 1302-1315; Florence, Accademia), originally from the Convent at Monticelli and closely based on Saint Bonaventure's text *Lignum vitae*. While the solemn air of the crisply defined crucified Christ owes something to the artistic traditions of the *Duecento*, the episodes in the forty-eight roundels exhibit lucid narrative designs that suggest some awareness of the contemporary art of Giotto. Change is evident in Pacino's later work, however, as the style of the *San Firenze Polyptych*, which comprises a central *Crucifixion* with flanking saints, testifies. This altarpiece combines a Giottesque naturalism, conveyed in the

convincing plasticity of the forms, with a sense of grace and elegance, especially in the poses and suggested movement of the figures, which are close in temperament to the art of the Saint Cecilia Master.

Padua (Latin Patavium, Paduensis, Padua; Italian Padova) is a city of the Veneto, situated about 22 miles (35 kilometers) west of Venice on the floodplain between the Bacchiglione and Brenta rivers. The Roman historian Livy, a native of nearby Abano, maintained that Padua was founded by the Trojan hero Antenor. On the basis of the legend, thirteenth-century Paduan chroniclers attributed Trojan ancestry to the local nobility and claimed for their city a preeminence comparable to that of Rome. In 1284, in a gesture of civic pride, the Paduan commune erected in the Piazza Antenore a sarcophagus containing the alleged relics of Antenor. The city, however, was probably founded by the Veneti, a tribe of uncertain origins who settled in the region in the tenth century B.C. Padua was an ally of Rome by the third century B.C. and a subject city from the early second century onward. It obtained Latin rights in 89 B.C. and full Roman citizenship in 49 B.C.

Ancient Padua flourished as a trade nexus and a center for the manufacture of woolen textiles. By the time of Augustus it ranked second only to Rome in wealth, but from the fourth century after Christ it experienced a decline, accelerated by the Germanic migrations. It was sacked by the Huns under Attila in 452, and it passed to the Ostrogoths in 476. The city was captured by Justinian's armies during the Gothic wars and remained under Byzantine control until the Lombards

occupied the region at the end of the sixth century. An unsuccessful rising against the Lombard king Agilulf in 601 resulted in a long siege and the virtual destruction of the city. Until the ninth century, the center of municipal activity in the Padovano (the province of Padua) moved to Monselice, about 12 miles (20 kilometers) to the southwest. As part of the Lombard duchy of Friuli, the region passed to the Franks in 774, when Charlemagne annexed the kingdom of Italy.

During this period, a measure of continuity was provided by the church. According to legend, the first bishop of Padua was Prosdocimus, reputedly a disciple of the apostle Peter, and an early cult of Saint Prosdocimus is attested to by a sixth-century Italo-Byzantine shrine preserved under the present basilica of Santa Giustina. The first historical evidence of a bishop in Padua dates from the mid-fourth century. The see survived the Germanic migrations, but the bishops of the seventh century suffered exile and a loss of territorial jurisdiction through their adherence to the Nestorian doctrine of the "Three Chapters," which had been condemned as heretical by Rome. To this period belongs the foundation of the Benedictine monastery of Santa Giustina. Generously endowed with rural estates and tithes, the monastery became the richest religious corporation in medieval Padua. The Carolingians restored some of Padua's former importance as an

ecclesiastical and administrative center. The ninth century saw the construction of the church of Santa Sophia, a cathedral, and new walls enclosing the Roman city. Little survives of the original cathedral, which was renovated in the twelfth century and entirely rebuilt in the Renaissance after designs by Michelangelo. Santa Sophia, the oldest extant church in Padua, was reconstructed in the twelfth century in a Lombard Romanesque style but retains its original apse, modeled on the Byzantine churches of the Ravenna exarchate. With the disintegration of the Carolingian empire, accumulated feudal and jurisdictional privileges, which after 897 included comital powers, left the bishop virtually the sole public authority in the city and the immediate district. In the tenth century, Bishop Peter (r. 897-904) defended Padua against the Hungarians; early in the eleventh century, Ursus (r. 992-1015) sponsored an extensive reconstruction of the city. Later, Uldericus (r. 1064-1083), a partisan of Pope Gregory VII in a region that was generally pro-imperial, played a role in the investiture controversy as an intermediary between the pope and Emperor Henry IV.

For administrative purposes, the Carolingians divided the Lombard duchy of Friuli into four counties, one of which was centered at Padua. At the end of the tenth century, the Ottonian emperors renewed the jurisdiction of the counts of Padua, with the exception of the city, where the bishop retained comital privileges. But within a century, the Germanic custom of partible inheritance had caused the title of count and the powers associated with it to become dispersed among several branches of the Conti family, some of which merged into the urban citizen body. Other lines, such as the Da Carturo, the Schinelli, and the Maltraversi, remained powerful feudal landowners, with estates in the northwestern Padovano and *palazzi* in Padua; but by the mid-twelfth century they were overshadowed by the Estensi, the Da Romano, and the Camposanpiero. Descended from noble clans that came to Italy with the Ottonians in the tenth century, these families exploited their wealth and grants of imperial privileges to divide the Padovano among themselves. The Camposanpiero and Da Romano possessed extensive estates and castles northeast of Padua; the Estensi, the leading aristocratic family, took their title from the castle of Este in the southern Padovano. The Estensi acquired the title of *marchesi* (margraves) of Ancona from Pope Innocent III in 1208 and a permanent

urban base as *signori* (lords) of Ferrara in 1264. Padua shared in the demographic and economic growth of Italy between 1100 and 1300. Although the statistics are necessarily conjectural, it appears that the population of the city more than doubled in this period, from about 15,000 in the late twelfth century to at least 35,000 at the beginning of the fourteenth, putting it in the middle rank of contemporary Italian cities, comparable to Verona, Perugia, and Pavia. In contrast to its neighbor Venice, Padua did not greatly benefit from long-distance trade, with the result that unlike Venice, Genoa, and Florence, it never developed a substantial merchant-banker class. Instead, the wealth of medieval Padua derived from the shrewd exploitation of the *contado*, its rural hinterland and subject territories, an area of about 260,000 hectares (640,000 acres) that corresponded roughly to the modern civil province of Padua. The rich volcanic soils of the Pedevenda, the Euganean hill country southwest of the city, were intensively cultivated for wine and olive oil; and the plain, once drained, was devoted mainly to arable land and pasturage. Linked to the *contado* and to export markets in Venice and Chioggia by a system of canals built between 1189 and 1212, Padua served as a market and conduit for the distribution of the region's produce. By the thirteenth century, the city's monopoly of regional trade and the lucrative duties it generated were guaranteed by its political control of the *contado* and by statutes forbidding competition against the Paduan market.

The nature of the Paduan economy dictated the structure of urban society. Victualers (butchers, taverners, bakers, salt merchants, greengrocers), transport workers (wagoners, bargees), and leather workers (tanners, cobblers, saddlers, shoemakers), all of whom dealt directly in the produce of the *contend*, made up a majority of the guilds recognized in the statute of 1287. In contrast to the situation in the ancient city, linen workers and merchants dominated the textile sector: the production of woolen textiles did not become a significant factor in the Paduan economy until the fourteenth century. Millers and their sponsors, both private and public, benefited from the water power provided by the Bacchiglione, and Paduan grain and fulling mills attracted business from the surrounding district and from as far away as Venice. The dependence of the city on the resources of the *contado* created a vigorous market in land, since most Paduans who made their

fortunes in trade, usury, or the professions invested their profits in the purchase or leasing of land in the *contado*. The land market also encouraged the development of a large class of notaries—some 500 by the late thirteenth century—who monopolized the business of drafting and authenticating legal acts; and judges, who dominated the administration of the city and the subject communities of the *contado*.

Economic growth and feeble imperial control in northern Italy allowed Padua to make the transition to communal government before the mid-twelfth century. The origins of the commune are obscure, but documentary evidence indicates that by 1138 the city was governed by seventeen consuls. In 1164, the commune formed an alliance with Verona, Vicenza, Treviso, and Venice to resist an attempt by Frederick I Barbarossa to enforce imperial judicial and fiscal rights. Three years later, an expanded coalition including Brescia, Mantua, Cremona, and Milan became the first Lombard League, which inflicted a humiliating defeat on Frederick in 1176. Under the peace of Constance (1183), the emperor was forced to recognize the effective autonomy of the communes in matters of internal government, lawmaking, and control of their *contadi*. Padua joined a revival of the Lombard League in 1226 in opposition to Frederick II's renewal of imperial claims, and a coalition against Frederick II's son Conradin in 1267.

As in other cities where communes evolved, Padua was dominated by established landowning families with a small admixture of the richer urban elements that had begun to emerge by the twelfth century. The appointment of a *podestà* (chief magistrate) in 1174 may reflect tensions and conflicts within the original ruling class. As a foreigner invested for a limited term with executive and judicial authority, the *podestà* was supposed to transcend local factions. Nevertheless, according to the chronicler Rolandino, by the end of the twelfth century the city and the region were split by feuds that pitted the Da Romano against the Camposanpiero and the Estensi, and the rural nobility against the urban bourgeoisie. During the first half of the thirteenth century, these rivalries were translated into a struggle for domination of Padua itself. Briefly under the control of Azzo VII d'Este, the city was captured in 1237 and held for twenty years by Ezzelino III Da Romano in the name of Frederick II. The turbulence of the period was reflected in the reconstruction of the old walls enclosing the administrative center of

the city (1195-1210)—of which the Porta Altinate and the Porta di Ponte Molino survive—and a castle (La Torlonga) built by Ezzelino in 1237. Opposition to Ezzelino's increasingly arbitrary regime united the rural nobility and the urban communal classes, particularly in the confusion that followed the death of the emperor in 1250. In 1256, a crusade of political exiles sponsored by Pope Alexander IV and led by the Estensi toppled the Da Romano and restored the independence of the commune. Until the death of the free commune in 1318, Padua would usually align itself with the Guelf cause in its relations with other cities.

In Padua, the society of the *popolo* (the people) was called the *comunanza*. It originated as a coalition of rich urban citizens and guildsmen who lacked a rural power base and were consequently excluded from the commune. Members organized militia units based on the city's four quarters and bound themselves by an annual oath to defend their common interests, by force if necessary, against the nobles who dominated the commune. Although the early history of the *comunanza* is obscure, it appears to have been the leading political force in the city by the time Ezzelino seized power, and probably as early as 1200. It returned to a position of control soon after the expulsion of the Da Romano in 1256. The victorious *comunanza* refrained from abolishing the commune: as the statutory code compiled between 1276 and 1285 shows, the *comunanza* subordinated the commune by making adherence to the popular coalition a condition of participation in government. The *consiglio maggiore* ("great council"), the communal legislative assembly, was retained and even expanded in 1277 from 400 to 1,000 members, but participation was restricted to members of the *comunanza*. The *podestà*, along with his judicial and administrative staff, continued to be recruited from foreign cities at fixed intervals, but the *comunanza* ensured its monopoly of power through an armed force of cavalry and infantry and a twelve-man council of *anziani* (elders). Selected every two months by an assembly of the *comunanza*, the *anziani* represented the administrative quarters of the city and eight of the thirty-six guilds recognized by the city statutes. Electors chosen by lot designated the district *anziani*, and councillors nominated by the outgoing magistrates determined which guilds would elect *anziani* to speak for the guildsmen. Once appointed, the *anziani* exercised considerable powers: they reviewed all decisions

of the *podestà*, controlled the agenda of the council, and reserved the authority to appoint a *capitano del popolo* ("captain of the people") to defend their interests in a crisis.

Although the regime of late thirteenth-century Padua represented a widening of the political class in response to pressure from below, as much as 90 percent of the urban population, and virtually all of the rural population, was denied access to government. Minimum property qualifications barred wageworkers, peasants, and many minor guildsmen from participation in the council and officeholding. At the other end of the social scale, about twenty noble families were formally disenfranchised by communal statute. The wealth, prestige, and potentially signorial ambitions of such *magnati* (magnates) were viewed as a threat to the stability of the commune. The few thousand Paduans who enjoyed political privileges represented two distinct classes: guildsmen and nonguildsmen. Despite the preponderance of guildsmen on the board of *anziani*, the non-guildsmen—mainly judges and representatives of nonmagnate noble families—seem to have exercised leadership by virtue of their social status and administrative expertise. The hegemony of this hybrid ruling class remained largely unchallenged until the early fourteenth century; its internal coherence may be ascribed to a community of interest between the guild and non guild elements, both of which were created and sustained by the economic exploitation of the *contado*.

The period from 1256 to 1318 was the golden age of medieval Padua. In the absence of external threats to its security and the internal dissensions that led to upheavals and signorial rule in most other Lombard cities, the commune consolidated its hold on the *contado* and even extended its influence through the annexation of Vicenza in 1266 and Rovigo in 1306. Stability and prosperity found expression in ambitious building programs and a vital cultural life. To this period belong several of the most notable churches and civic monuments of Padua, the refoundation of the university, and the flowering of a civic literary tradition.

The focus of public life was the Palazzo Comunale, or Palazzo della Ragione, which stands in the city's central market square between the Piazza delle Erbe and the Piazza delle Frutta. Originally built in 1216, it was extensively reconstructed in 1306 by the native architect Fra

Giovanni degli Eremitani (fl. 1295-1320), who added the vast upper hall with its ribbed timber roof inspired by Venetian ship design. Measuring about 260 feet long by 89 feet wide by 89 feet high (79 by 27 by 27 meters), the *salone* (chamber) is the largest and most impressive of extant medieval Italian halls. The fresco cycles illustrating the calendar, the liberal arts, and the religious history of Padua date from the fifteenth century; they replaced earlier frescoes destroyed by fire in 1420 and said to have been painted by Giotto under the direction of the scientist Pietro d'Abano (c. 1250—c. 1316). Also preserved in the hall is the *pietra del vituperio* ("stone of shame") where bankrupts were publicly humiliated before expulsion from the city. In the communal period, the Palazzo Comunale housed the offices of the *podestà* and the law courts, while the covered arcades on the ground level served as market stalls. West of the Palazzo Comunale stood the palace of the guilds; and to the east, on the site of the present *municipio*, there was a complex of buildings constructed or refurbished between 1281 and 1285—of which only a tower remains—that housed the residence of the *podestà*, the Palazzo degli Anziani, and the Palazzo del Consiglio.

The most conspicuous monument of thirteenth-century Padua is the great pilgrimage basilica of Sant'Antonio, popularly known as the *Santo*. The basilica was begun in the 1230s to house the remains of the famous Franciscan preacher and theologian, who spent his last years in the vicinity of Padua; it took almost a century to complete. The external arrangement of six domes complemented by a central cupola and two campaniles blends Romanesque, Gothic, and Byzantine elements in a style that is reminiscent of San Marco in Venice. The impressive interior, measuring nearly 380 by 108 feet (115 by 32.5 meters), reflects a similar mixture of influences. The basic plan of a Latin cross with an ambulatory and radiating chapels at the east end is Gothic in inspiration, while the details of the central aisle and choir are Romanesque. With a few exceptions, however, the sculpture and decoration, including the shrine of Sant'Antonio, date from the Renaissance and Baroque periods.

The Eremitani, the church of the Augustinian friars in the northern Ponte Altinate quarter, was built between 1276 and 1306, and the facade was added in 1360. This church was virtually destroyed by bombing in 1944 but has been restored, though most of the medieval decoration is

lost, except for fragments of apse frescoes and sculptures. The nearby Cappella degli Scrovegni, or Arena Chapel, contains Giotto's most famous frescoes. The chapel was erected in 1303 in the ruins of a first century amphitheater adjacent to the palace of the Scrovegni, who were among the richest of the "new families" that flourished under the *comunanza* regime. The donor, Enrico Scrovegni, inherited a fortune from his father, Renaldo, a notorious usurer whom Dante consigned to hell (*Inferno*, 17.64-75), and the commission was probably intended as a gesture of expiation. If, as some argue, the chapel itself was designed by Giotto, it is the only intact example of a building both planned and decorated by him. The brick structure comprises a simple barrel-vault nave of about 69 by 28 feet (20.8 by 8.5 meters) terminating in a small Gothic sanctuary containing Scrovegni's tomb. Painted between 1304 and 1313, the fresco cycle tells the story of human redemption and final judgement in a series of forty wall panels framed by painted moldings and architectural details. The upper registers on the south and north walls recount the life of Mary; the middle registers recount the life of Christ; and the bottom recounts the history of the passion, the resurrection, and Pentecost. The whole scheme surmounts a painted marble wainscoting broken by monochrome allegorical figures of the seven virtues and vices. The theme of the east wall is the Annunciation, and the choir arch is dominated by a panel of God the father dispatching the angel Gabriel to Mary. The west wall depicts the Last Judgment; among the blessed, Giotto included a portrait of Enrico Scrovegni presenting the chapel to Mary. The frescoes are complemented by statues of the Virgin and two acolytes executed for the altar by the sculptor Giovanni Pisano (d. 1320).

Although there were schools of law and grammar associated with the cathedral in the twelfth century, the *studium* (university) of Padua traced its history to 1222, when a group of students and masters seceded from Bologna and established schools in the Rudena district in the eastern suburbs of the city. Suppressed or restricted in its activities under Ezzelino, the *studium* revived with the commune, and its development into an important academic center was actively fostered by the new regime. By 1264, when Pope Urban IV confirmed the statutes of the *studium*, universities of canon and civil law, a university of arts and medicine, and colleges of doctors of law and arts had been

created or refounded. As in Bologna, the universities properly speaking were student corporations that elected their own rectors and teachers. The colleges represented doctors and professors, and controlled admission to degrees. As chancellor, the bishop of Padua exercised formal jurisdiction and conferred degrees, but in practice the university was closely regulated by the commune. In 1262, the commune assumed responsibility for paying the salaries of law professors, and by 1331 it was appointing professors directly, subject only to formal ratification by the student universities. As early as 1261, communal statutes prescribed curricular texts; and the codification of 1285 defined the legal privileges of students and guaranteed them exemptions and protection with respect to lodging, taxation, and loans.

Although Padua was later famous for its medical schools, the medieval university was dominated by law. Medicine was taught along with grammar, rhetoric, logic, and natural science in the arts university, which remained formally subordinate to the jurists' university until the mid-fourteenth century. By 1321, the commune was supporting four professors of medicine and one professor each in surgery, philosophy, logic, and grammar. The foremost arts professor in this period was the physician and astrologer Pietro d'Abano. A native of Padua, Pietro studied in Constantinople and lectured in Paris, where he came into contact with the prevailing Averroist interpretation of Aristotle. He returned to Padua in 1306 to teach medicine and philosophy. His extant writings include several influential translations of Greek medical texts and specialized treatises on poison and physiognomy. Astrology is the central topic of Pietro's two major works, a commentary on the pseudo-Aristotelian *Problems* and *Conciliator*, an attempt to reconcile medicine and philosophy. These, along with a series of astronomical treatises by Pietro, testify to the existence of a flourishing school of astrology in early fourteenth-century Padua.

With the overthrow of Ezzelino, a school of distinctly 'civic writing emerged first in the ambience of the university and then among the judges and notaries of the administrative class. Rolandino, the first figure in this tradition, was born in 1200, the son of a notary, and was trained in Bologna, where he was a pupil of the Florentine rhetorician Buoncompagno da Signa. Rolandino appears to have combined a notarial practice in Padua with teaching in the arts university from 1221

until his death in 1276. *Cronica*, his only surviving work, was read before the university and approved by the masters and doctors of arts in 1262. Inspired by a local tradition of civic annals and the example of Buoncompagno, who had written on Frederick I's siege of Ancona, Rolandino related the history of the Da Romano tyranny from which the city had just been liberated. Tightly written in the rhetorical style of the schools and varied by speeches and diatribes, the *Rolandina*, as the chronicle came to be known, is a powerful indictment of tyranny and a celebration of communal ideals; it achieved virtually canonical status as an expression of the popular regime's ideology. Despite its popularity, however, Rolandino's chronicle had no imitators: later chroniclers reverted to the spare annalistic style that had prevailed before Rolandino. An exception was the judge Giovanni da Nono, who turned to different models altogether. His *Visio Egidii* (*Vision of Egidius*, a legendary king of Padua), written between 1314 and 1318, was inspired by popular pilgrim guides to Rome and is notable as the only topographical description of Padua by a medieval writer. His *De generatione aliquorum civium urbis Padue* (*On the Ancestry of Some Citizens of Padua*) drew on noble genealogies and popular legends to construct an unconventional portrait of the city seen through the histories of more than 100 of its most prominent families, ranked according to their status.

The circle of Latinists that appeared in the last decades of the thirteenth century was significant because it anticipated several characteristics of Petrarchan humanism. As lawyers and notaries, the Paduan "prehumanists" shared the social and professional background of the chroniclers. What distinguished them was their effort to reproduce the vocabulary, style, and cadences of classical Latin in their own writing. Lovato Lovati, the leading figure in the group, was born c. 1240 into a family of notaries, was a communal judge by 1267, was knighted in 1291, and died in 1309 after a successful judicial and administrative career. His literary reputation rests on a series of metrical letters that display a new awareness of classical prosody. The source of Lovato's interests is unclear, but echoes and allusions in his poetry suggest that he was familiar with manuscripts of Tibullus, Martial, Horace, Valerius Flaccus, and Seneca preserved in the libraries of Verona, Pomposa, and Bobbio. Perhaps his most significant

accomplishment was deciphering the meter of Seneca's *Tragedies*, which he explained in a commentary written in the 1290s for the benefit of his circle.

Lovato's disciples and imitators displayed a similar dedication to the classics. Rolando da Piazzola (fl. 1300), Lovato's nephew, was among the first medieval intellectuals to take an interest in recording classical inscriptions. Geremia da Montagnone (c. 1255-1321), whose knowledge of ancient Latin writers rivaled that of Lovato himself, compiled a popular *florilegium* of classical tags, including extensive quotations from the newly recovered Verona Catullus. However, Lovato's most accomplished disciple, and the writer in whom the Paduan tradition culminated, was Albertino Mussato (1262-1329). The son of a court messenger, Mussato made a meager living as a copyist of university texts until 1282, when he became a notary. By 1296, he had obtained a knighthood and married the daughter of Guglielmo Lemici, one of the richest moneylenders in Padua. The Lemici connection opened the way to politics, and Mussato emerged as a leading figure in communal affairs and diplomacy between 1310 and 1325. Under the influence of Lovato, Mussato explored the contemporary potential of Senecan tragedy and immersed himself in the historical writings of Livy, Sallust, and Caesar. In his tragedy *Ecerinis* (1314), he resurrected the legend of Ezzelino da Romano to alert his fellow citizens to the threat posed by the territorial ambitions of the *signore* of Verona, Cangrande della Scala. Although the Senecan meter of *Ecerinis* made it virtually incomprehensible to its intended audience, the play nevertheless earned Mussato popular acclaim and the distinction of a laurel crown from the university in 1315. The gesture, with its classical overtones, created a sensation in literary circles and inspired Dante, exiled in Verona, to long (in vain) for a similar honor in Florence. Inspired by Livy and Sallust, Mussato's *Historia Augusta* (*Imperial History*) and *Degestis Italicorum* (*On the Deeds of the Italians*) attempt to explain the contemporary history of Padua by reference to the larger geopolitical realities of Italy: the theme of the *Historia Augusta* is Henry of Luxembourg's Italian expedition of 1310-1314; and the unfinished *Degestis* draws a parallel between the decline of the Roman republic and the death of the Paduan commune.

Paduan prehumanism inspired similar movements in Vicenza,

Verona, and Venice, but as an indigenous school it perished with the commune. A postscript, however, was provided by Marsiglio Mainardini. Marsiglio was born between 1275 and 1280 and studied in Padua and then in Paris, where he was rector in 1312-1313. He probably studied medicine under Pietro d'Abano after returning to Padua and was associated with Mussato, who wrote a dialogue on Senecan meter at Marsiglio's request and addressed to him a verse letter on the relative merits of medicine and law. Marsiglio left Padua at the time of the first Carrara takeover (1318), but his renowned treatise on government, *Defensor pacis* (*Defender of Peace*), which he completed in 1324, reflects the republican ideals of the Paduan circle. Marsiglio was condemned as a heretic for his radical critique, in *Defensor*, of the temporal power of the pope; he sought refuge in 1327 with Lewis of Bavaria, whom he served as an adviser and court physician until his death in 1342.

Henry VII's expedition initiated a prolonged crisis in Paduan affairs that ended with the abolition of the commune and the establishment of a permanent *signoria* by the Carrara family in 1328. Before this, however, rifts had begun to appear in the ruling coalition. In 1293, internal divisions caused by the commune's decision to go to war against its traditional allies, the Estensi, provoked fears of a coup by the magnates. Guildsmen reacted by creating an armed "union of the guilds" to protect their interests, and when peace was restored, the union continued to represent a powerful bloc within the *comunanza*. Under pressure from the union and the council of guild provosts, the board of *anziani* was expanded to eighteen in order to strengthen the influence of guildsmen in government. The new guild leadership exhibited less deference to Padua's traditional alignments: conflicts with Este Ferrara, in which Padua was supported by the della Scala of Verona, and a war in 1304 against traditionally friendly Venice undermined the old network of Guelf alliances that had favored the independence of the commune.

It was against this background of unsettled regional politics that the emperor, Henry VII, arrived in Italy. Padua felt the effects of his intervention almost immediately when an insurrection erupted in the subject city of Vicenza. In 1311, Vicen tines—backed by Veronese and imperial troops—expelled the Paduan garrison and confiscated Paduan property in the Vicentine *contado*. When the commune's friendly

overtures to Henry failed to prevent his appointment of Cangrande della Scala as imperial governor of Vicenza, Padua joined Florence and other Guelf cities in rebellion. An internal power struggle resulted in the replacement of the *anziani* and guilds by a twelve-man emergency commission controlled by rich nonguildsmen and professionals led by Albertino Mussato, who immediately set about repairing the commune's links with its former allies. But the early defection of magnate families, combined with the regime's Ghibelline witch-hunts and the failure of its campaign against Cangrande, provoked an uprising in 1314 and a return to the prewar forms of government.

The reestablished commune faced a powerful rival in the Carrara family, which had emerged from the upheavals of 1311-1314 at the head of an influential party in favor of peace. One of the old magnate clans of the southern Padovano, the Carraresi, had declined during the thirteenth century as the family estates were dispersed through inheritance. By the early decades of the fourteenth century, however, the main branch of the family, headed by Giacomo da Carrara, had recouped some of its fortune and influence, which were now deployed to achieve control of the city. In September 1314, Giacomo successfully negotiated a treaty with Cangrande that held until 1317, when the commune made an unsuccessful bid to retake Vicenza. In the ensuing war, Padua was badly defeated, and the terms of a second peace arranged by Giacomo ensured his election as *signore* in July 1318. His triumph, however, proved ephemeral: undermined by Cangrande, who was determined to incorporate Padua into his own regional empire, Giacomo was forced to barter his *signoria* to the imperial claimant, Frederick of Austria, in exchange for help against Verona. Submission to the empire bought Padua a brief respite from Veronese aggression, but domestic politics degenerated into bloody factional clashes in the city and magnate revolts in the *contado*. The death of Giacomo in 1324 unleashed new levels of violence. On the order of Giacomo's nephew Marsiglio, opponents of the Carraresi were murdered or, like Mussato, forced into exile. Unable to secure further German troops, Marsiglio reached an accommodation with Verona. In September 1328, an intimidated *consiglio maggiore* elected Cangrande della Scala imperial vicar and nominated Marsiglio da Carrara "captain, protector, and general defender" of Padua.

The Carraresi ruled Padua for seventy-five years. After 1337, when Florence and Venice helped Marsiglio shake off the della Scala, they governed alone. Francesco I "il Vecchio" stabilized the new order. Elected to the *signoria* in 1350 following the assassination of his father, Giacomo II, Francesco shared power with his uncle Giacomino until the latter's deposition in 1355, after which he ruled as sole *signore* until 1388. Granted broad authority by the statute of election, Francesco formalized the concentration of power in the hands of the *signore*. Under revised statutes of 1362, the *podestà* became an appointee of the Carraresi, while the *anziani* and the *consiglio maggiore*, the latter now stripped of its legislative powers, were reduced to confirming the election of new *signori*. The guilds lost their independence through subordination to the *podestà*, who was put in charge of regulating economic activity. The communal administrative apparatus was left intact, but the status of the notaries and judges who had dominated government in the thirteenth century was drastically diminished. Magnate relatives and supporters of the Carraresi monopolized the most lucrative posts, advised the *signore*, and commanded the new military formations that replaced the communal militia. The Carrara household, which was now the real locus of power, recruited its officials, jurists, and diplomatic secretaries from the upper strata of the citizen class. Through gifts of land and tax exemptions, this privileged group of bourgeois families merged with the old nobility to produce a new, distinctly signorial ruling class.

The Carraresi maintained public sponsorship of the university. Francesco patronized legal studies by endowing a college for destitute law students and importing distinguished law professors, such as the Florentine canonist Lapo da Castiglionchio (d. 1381) in 1379, and Baldus de Ubaldis (c. 1327-1400), who lectured on civil law between 1376 and 1379. The growing distinction of the arts university fueled a dispute with the law component that led to the effective separation of arts and law under Francesco in 1360. Three years later, Pope Urban V completed the evolution of the medieval university when he sanctioned the creation of a faculty of theology from a union of the existing *studia* of the Dominican, Franciscan, and Augustinian friars.

The patronage of the Carrara attracted several humanists to Padua, of whom the most famous was Petrarch (1304-1374). Petrarch was

presented with a benefice by Francesco in 1349; and in 1370, near the end of his life, he settled permanently at Arquà in the Euganean hills, where he devoted himself to editing his poetry, his letters, and his incomplete epic on Scipio Africanus. A year before his death he composed, at Francesco's request, an epistolary tract on the duties of a ruler, which is included in his *Letters of Old Age*. Drawing on classical and patristic sources, Petrarch represented the ideal prince as a benevolent, paternal figure who stood above factional interests and surrounded himself with just advisers. Petrarch sketched an ambitious program of public works, low taxes, and cultural largesse as an alternative to the petty wars that plagued the region, many of which were instigated by his patron. Giovanni Conversini da Ravenna (1343-1408), an admirer of Petrarchan humanism, entered the service of the Carraresi in the 1380s. Under Francesco Novello, he became a professor of rhetoric in 1392 and later chancellor of the university. Conversino's commitment to the Ciceronian ideal of *virtus* strongly influenced his pupils, among them the founders of the first humanist schools, Vittorino da Feltre (1378-1446) and Guarino da Verona (1370-1460). Similar interests were expressed by Pier Paolo Vergerio (1370-1444), the first theorist of humanist pedagogy. Vergerio was born in Istria and studied in Padua and later in Florence. In 1399, he returned to Padua to lecture on logic in the university. His *De ingenuis moribus* (*On Noble Customs*) was written in 1402 or 1403 and addressed to the third son of Francesco il Vecchio, Ubertino, whom Vergerio had probably tutored. The tract departed from medieval precedents by emphasizing the value of the *studia humanitatis*—particularly history, rhetoric, and moral philosophy—as a preparation for public life. An anticipation of the educational ideals of the humanist schools that soon proliferated in northern Italian princely courts, Vergerio's treatise remained influential throughout the fifteenth century.

A local school of painters inspired by Giotto flourished under the Carraresi. Guariento di Arpo (died c. 1368) and his younger contemporaries, the Veronese Altichiero di Zevio (d. 1395) and the Florentine Giusto de' Menabuoi (d. 1393), were responsible for the most important surviving examples of late medieval painting in Padua. Guariento's earliest extant work is a series of twenty-nine ceiling panels in the former Cappella del Capitano of the Loggia Carrarese, depicting

Old Testament themes and the angelic hierarchies. Frescoes of saints Philip, James, and Augustine painted in 1338 are unfortunately all that survive of his cycle in the apse of the Eremitani. On Petrarch's advice, Francesco il Vecchio commissioned portraits of famous Romans for the Sala dei Giganti, part of the original Carrara *palazzo* incorporated into the sixteenth-century Palazzo del Capitano. A fragment of the original series portraying Petrarch in his study at Arquà has recently been attributed to Altichiero. In 1379, Altichiero decorated the chapel of San Felice in the south transept of the basilica of Sant'Antonio with frescoes of the crucifixion. The neighboring Oratorio di San Giorgio, built by the Lupi family between 1377 and 1384, contains the painter's important cycle of the lives of saints George, Lucy, and Catherine. Though much damaged, Giusto's contemporary paintings in the Belludi Chapel of the *Santo* illustrating episodes from the lives of the apostles Philip and James are, apart from their stylistic importance, vivid evocations of the busy street life of medieval Padua. Giusto was also commissioned by Fina, the wife of Francesco il Vecchio, to decorate the baptistery, which had been constructed in 1171 and renovated in 1260. The cycle is among the most ambitious and complex of medieval Italian fresco programs. Executed between 1376 and 1378, it depicts the Genesis narrative, episodes from the lives of John the Baptist and Christ, and the Apocalypse.

The autonomy of the Carrara lords of Padua was compromised by their early dependence on Venice and by the constant threat of neighboring Verona and Milan. From the beginning of his *signoria*, however, Francesco il Vecchio pursued an aggressive policy of territorial conquest, financed by heavy taxation, compulsory loans, and arbitrary confiscations, which increasingly alienated his subjects. War with the duke of Milan, Gian Galeazzo Visconti, resulted in a Milanese occupation of Padua in 1388 and the imprisonment of Francesco, who died five years later. Returned to power with Venetian support in 1390, Francesco's heir, Francesco Novello, resumed his father's policy; and when Gian Galeazzo's death in 1402 removed the Milanese threat, Francesco Novello's territorial ambitions brought him into direct conflict with Venice. Deserted by the population of the *contado*, which had been exhausted and impoverished by decades of conflict, Francesco and his supporters were reduced to maintaining a precarious hold on

Padua itself. After a siege of eighteen months, the city fell to the Venetians in November 1405. Francesco was taken to Venice, tried, and later strangled in prison. Other members of the Carrara family were banned from Paduan territory, and their supporters were exiled. The "Golden Bull" of 30 January 1406 formally deprived Padua of its independence and incorporated it into the mainland empire of Venice, of which it would remain a province until 1797.

Paganino da Serezano

Paganino da Serezano is an unknown poet of the *Duecento*; only one of his poems has survived—the *canzone Contra lo meo volere*. From the place he occupies in the Vatican Codex 3793, between Arrigo Testa and Pier della Vigna, we may infer that he belonged to the oldest generation of the poets of the Sicilian school, and he imitates a practice of Giacomo da Lentini by naming himself in his poem. His exact geographical extraction remains a mystery. The locality is given in the Vatican Codex as Serezano, but MS Rediano 9 (Biblioteca Laurenziana, Florence) proposes Serzana. The identification of a township bearing a name of this configuration is quite difficult. Among the many suggestions are Sarzana in the Lunigiana, Serezano in the Tortonese, and Serezzano in

the Versilia region.

Pagliaresi, Neri

Neri di Landoccio Pagliaresi (c. 1350-1406) was one of Catherine of Siena's secretaries and a poet who composed religious *lattede*, an encomiastic poem about Saint Catherine, and two *cantari* about spiritual conversion. Neri was born into an aristocratic family of Siena and was a prominent public figure, serving two terms in the general council in 1371 and 1375. It was during these years that he underwent a spiritual conversion and became a devout follower of Catherine. In an undated letter that was probably written in 1371 (Dupré-Thézeider 1940, 7-99) Catherine welcomes Neri to her *famiglia*. Along with Stefano di Corrado Maconi and Barduccio di Piero Canigiani, Neri became a leading member of Catherine's group, and he quite likely collaborated with her on *Libro della divina dottrina* (Fawtier 1921-1930, 1:349). According to several letters and documents, he often

accompanied Catherine on important diplomatic missions, such as a mission to Lucca in 1376, when she attempted to dissuade the Lucchesi from joining the antipapal league. As Catherine's ambassador, Neri traveled to Avignon to consult with the pope and was active in the peace negotiations between Rome and Florence in 1378. He learned of Catherine's death while he was on an embassy to the Neapolitan court of Giovanna (Joanna) II in 1380. Neri spent the remaining years of his life in Siena, where he collected Catherine's letters and translated Raimondo di Capua's *Legenda maior*.

According to Gardner (1907, 85), Neri is a high-strung and sensitive poet, whose *laude* and *cantari* are among the best religious poems of the trecento. The *Leggenda di Santo Giosafà* is a *cantare* in *ottava rima* that recounts an Indian prince's conversion to Christianity. It is based on an Iranian tale about Barlaam and Josaphat, two names for Buddha. Again using the *ottava* form, Neri also composed the *Istoria di Santa Eufrosina*, which narrates the life and death of a virtuous maiden. Conversion is the climactic moment of hagiographical narratives, and it often causes distress among the convert's loved ones. In his poetry, Neri represents the psychological and social conflict caused by spiritual commitment. Because it uses a popular tone and language, his poetry is at once personal and social, as can be seen in the eulogy to Catherine, *Spento è il lume che per certo accese*, and in the fifteen *laude*.

Painting: Fresco

The term "fresco," derived from the Italian for "fresh," is used to denote a variety of techniques for painting wall surfaces, practiced extensively from Roman antiquity through the Middle Ages to the eighteenth century. Though fresco is found all over Europe, this mode of mural painting was best suited to the dry climate of the Mediterranean countries, and its great flourishing occurred in medieval and Renaissance Italy, where from the thirteenth century onward a tremendous proliferation of frescoed images is found.

Two varieties of fresco technique were in widespread use in medieval Italy: *buon fresco* and *fresco secco*. *Buon fresco*, or "true fresco," is a process in which powdered pigments, suspended in water, are applied to a wet, freshly spread lime plaster surface. The damp plaster absorbs the brushed-on pigment like a sponge, and, as it dries, the lime of the plaster forms a chemical bond that fixes the pigment in a crystalline film of calcium carbonate, insoluble in water. The resulting image is one of the most durable paint surfaces known, as the pigment is embedded in the wall itself rather than forming a superficial coating. *Fresco secco*, or "dry fresco," also uses a plaster ground, but in this case the plaster is allowed to dry before the pigment is applied to the surface through a tempera, oil, or lime-water binder. This technique is necessitated by some pigments, such as lapis lazuli, and it is much easier to execute; but the result is much less durable, tending to flake off over a period of weathering or abrasion.

Both techniques were apparently known since antiquity; the ancient Roman architect Vitruvius describes a method of true fresco that is close to the technique spelled out in *Il libro dell'arte* (*The Craftsman's Handbook*), a late fourteenth-century shop manual set down by Cennino Cennini, a Florentine pupil of Agnolo Gaddi; and many *fresco*

secco murals survive from Roman antiquity. It seems that *fresco secco* was practiced continuously from antiquity through the Middle Ages, as all painted wall decorations before the thirteenth century appear to have been executed in the dry manner. True fresco, on the other hand, is not found in Italy before the latter half of the 1200s. This surprising lapse in the use of true fresco has prompted some speculation that the proliferation of *buon fresco* during the thirteenth century was an independent discovery developed from the craft of mosaic; the technique of mosaic is more closely related to *buon fresco* than to *fresco secco*. A number of important mosaic cycles, such as those sponsored by King Roger in Sicily and the doges in Venice, were indeed being executed in the late twelfth century. The quicker, more economical *buon fresco* technique that appeared immediately following a major period of mosaic activity in Italy may be seen as an innovation spurred on by the economic incentive of making the expensive mosaic technique available to a less wealthy clientele wishing to follow the example of the elite.

The rise in popularity of fresco coincided with the great building boom of the thirteenth century, brought about by a tremendous influx of people seeking employment and security in the cities, and the throngs of worshipers attracted to the church by the popular appeal of the mendicant orders. Before this time few comprehensive mural schemes are found in Italy, with the exception of the few lavish mosaic decorations mentioned above, limited to the most exclusive levels of aristocratic patronage. But the construction of basilicas, cathedrals, town halls, hospices, and oratories in every town along the Italian peninsula occasioned a need for economical, quickly executed, yet durable programs of decoration for which the fresco technique was ideally suited. No cheaper or more effective way existed to raise civic pride through a commemoration of great heroes or events, or to communicate sacred narratives on a scale and level of drama that would thoroughly surround and captivate the viewer.

Much of this decoration was sponsored by the coffers of the church or the state, but a very large proportion was also commissioned by the newly rich and powerful merchant and banking classes, which sought to garner their share of fame and splendor by following the practices of the great ruling houses. Hence, in a form suited to their more modest means, they sought to advertise their place in local society through the

commission of privately owned but highly visible chapel or oratory decorations. Entire buildings, such as the Arena Chapel in Padua and the oratory of Or San Michele in Florence, appear to have been designed expressly with mural decoration in mind. The development of large cycles of decoration seems to have received a further boost from a renewed interest, during the late thirteenth century, in the early Christian decorations surviving in many Roman basilicas. In the 1280s and 1290s, for example, the Roman painter Pietro Cavallini was called on to repaint ruined early Christian frescoes in San Paolo Fuori le Mura and old Saint Peter's in Rome; and his own frescoes in Santa Cecilia in Trastevere closely follow early Christian models. Other cycles in the tradition of early Christian models appeared in San Piero a Grado (near Pisa) and the mosaic cycle in the dome of the Baptistery in Florence.

Though *buon fresco* was rapidly executed, economical, and durable, the actual technique involved was one of the most difficult for a medieval artisan to master and required the mobilization of an entire workshop, if not the hiring of additional help. The first step in the execution of a fresco was the preparation of the wall surface to be painted. Scaffolds large enough to support the team of apprentices and the painting equipment were erected before the bare stone or brick masonry of the structure. Often between 20 and 60 feet (6 to 18 meters) from the ground, the wooden platforms were dismantled and rebuilt from section to section until the entire wall space to be covered was completed. A number of artists are known to have died in accidents associated with these scaffolds. Any pronounced surface irregularities in the masonry were smoothed out to provide an even surface for the fresco, and precautions were taken to ensure that the wall to be painted was protected from moisture and salts, because water seepage into a wall will eventually crumble the plaster coating.

A layer of rough, gritty plaster, called the *arriccio*, was next laid directly on the masonry, to further smooth out irregularities in the wall surface such as gaps between the stone or brickwork, and to provide a toothy surface which could support the next layer of plaster. Horizontal and vertical plumb lines were snapped onto this layer of *arriccio* by means of a level and compass. In addition, as was learned from the damage to numerous fresco cycles incurred during World War II and during the flood of the Arno River in Florence in 1966, full-scale

sketches of the compositions to be painted were blocked in on the *arriccio*. Medieval craftsmen may have used small preparatory drawings on paper or parchment to work out a composition, but it seems that most of the designing of frescoes made before the *Quattrocento* took place in situ, directly on the wall to be painted. The master of the shop would first map out the position, size, and relative placement of the objects to be depicted with very rough charcoal drawings. Once the key compositional relationships were established, the charcoal marks were reinforced with a brush dipped in a solution of red ocher in water, yielding a red drawing called a *sinopia*, named after Sinope, a city in Asia Minor renowned for its red earth. The provisional charcoal marks were brushed off after the *sinopia* dried, leaving only the red outline to serve as a compositional guide. *Sinopie* were never meant to be seen by the general public, but they were one of the most essential steps in the preparation of a fresco, for through them the master was able to estimate and gather together the necessary amount of materials (such as the quantities of colors to be used), prevent architectural settings from being drawn out of plumb, work out the sequence for laying in the final layer of plaster, apportion out various sections to the workshop for execution, and have something to show to the patrons for approval before executing the design.

After completion of the *sinopia*, another, smoother, much finer layer of plaster, the *intonaco*, was applied to the *arriccio*. Before the revival of true fresco painting in the thirteenth century, the *intonaco* was laid down in very large patches corresponding to the height and length, which could be covered by the artisans working on the scaffold, or *ponte*; hence these long wide bands of *intonaco* are called *pontate*. Only after the *pontate* were completely dry was the pigment applied with some binder, following the *fresco secco* technique. In *buon fresco*, however, in a manner similar to mosaic technique, the fine layer of *intonaco* is laid in much smaller patches than are used for *fresco secco*. In true fresco, the pigment bonds solely with wet plaster, thus a medieval craftsman would lay down only as much *intonaco* over the *arriccio* as could be painted in a single day's work, before the plaster was dry. Each day's worth of work—called a *giornata* from the Italian *giorno*, "day"—would be quickly brushed with pigment before the eight or so hours it took for the plaster patch to dry. The general procedure

was to work from the top of a wall down to the bottom, so that dripping or running pigment would not ruin finished work below it. The sizes of *giornate* vary. Some patches could be quite large, since a relatively open stretch of the composition with few details such as a simple backdrop or a rocky hillside could easily be plastered and painted in a day. Other, more detailed sections tended to be small; a single head with all its features and variations of color could represent an entire day's painting.

The successful coordination of all the *giornate* into a single coherent image was a difficult task. The pigments available for fresco painting were limited to natural earth colors, such as red and yellow ochre or green terra verde, which would dissolve in lime. Pigments applied to the wet plaster looked different from their final appearance when dry, and the value of color changed depending on how damp the plaster was when the paint was brushed on. Any color that ran across more than one patch had to be applied to the different *giornate* when they were at the same degree of dampness, but this was difficult to gauge because the time it took for the plaster to dry varied with humidity, temperature, ventilation, and other environmental factors that changed from day to day and season to season. The seams of the *giornate* were visible in the final image; to mitigate this effect, the workshop tried to hide the borders along the contours of figures or buildings. Furthermore, the plaster patch covered the *sinopia* of the very section the artist was about to paint, so new drawings, sometimes cut in with a stylus, were made on the *intonaco* as it was laid down. As time was of the essence in the completion of each *giornata*, pigments were generally applied with large brushes, and compositions were deliberately designed to be simple and uncluttered to avoid time-consuming detail. If a mistake was made in *buon fresco*, the area could not be painted over but had to be chipped away and redone. All these considerations demanded an assuredness of hand and a high degree of familiarity with the idiosyncracies of the medium and the pigments used with it. These skills could be gained only from long experience, making the fresco technique one of the most challenging modes of creation ever faced by an artist. It is also a medium which could be realized only by a cooperative, collaborative process of art production, such as that found in the medieval workshops of Italy.

Some evidence indicates that cartoons or full-sized drawings were used during the *Trecento* to transfer a composition to the wall, although this practice is more typically associated with Renaissance fresco painting. The repeated ornamental border design frescoed in the 1360s by Orcagna's workshop on the entrance arch over the main chapel of Santa Maria Novella in Florence shows patterns of colored dots tracing the outlines of the geometric decoration. These dots were made by holding a cartoon of the design with holes punched in it against the *intonaco* while charcoal dust was pounced through the holes of the cartoon. Each of the repetitions of the design was made using the same punched cartoon (called a *spolvero*). Once the cartoon was lifted away, the painter used the pattern of dots as a guide to fill in the colors. Simone Martini's Montefiore Chapel in the lower basilica of San Francesco in Assisi shows a similar utilization of stencils for repeated patterns; and incision marks on certain frescoes such as the *Lamentation of Christ* in the nave of the upper basilica possibly result from an instrument tracing along the lines of a cartoon held against the damp *intonaco*.

Very few murals of the thirteenth and fourteenth centuries were executed solely in *buon fresco*. The limited range of the palette and the inhibition of detail in true fresco led to the addition of much *a secco* work. For example, the blue pigments known to medieval painters, such as azurite and lapis lazuli, are too coarse in grain to be absorbed by fresh plaster, so no true blue pigment was possible in *buon fresco*. The large expanses of sky and the many depictions of Mary's blue mantle in Giotto's frescoes in the Arena Chapel in Padua all had to be painted on with size (glutinous material) after the plaster dried. More than half of Simone Martini's *Investiture of Saint Martin* in the Montefiore Chapel in Assisi was painted in tempera over fresco; as a consequence, much of this highly detailed work has flaked away over the centuries. In truth, some medieval frescoes are a composite of all the painting techniques used in the medieval workshop. For example, the closely studied fresco of the *Madonna del Cucito* (Bologna, Pinacoteca Nazionale) by Vitale da Bologna is a complex combination of *buon fresco* with tempera and oil glazes overlaid by layers of varnish. Simone Martini, in such frescoes as his *Maestà* for the Palazzo Pubblico and his *Guidoriccio da Fogliano*, applied sheets of tin to the *intonaco*, which he then stamped with punch

marks and glazed with transparent veils of color, treating the fresco like a sumptuous panel painting rendered on a monumental scale.

Fresco is unsurpassed in medieval art for its epic sweep of color and form, which graces whole interiors from floor to ceiling; and the technique of fresco painting fostered a boldness of execution and breadth of form that had much to do with the conquest of space and volume in painting by artists in the ensuing Italian Renaissance.

Painting: Miniature

In Italy painting in manuscripts has a history that reaches back to antiquity (Weitzmann 1977). During the early Middle Ages this medium, referred to as manuscript illumination or miniature painting, was transformed by the requirements of the Christian liturgy and the shift from the roll to the codex in late antiquity, just as it was transformed by the introduction of the printed book at the end of the Middle Ages. Yet it is certainly valid to speak of "Italian" medieval miniature painting. Despite Italy's religious and political connections to the rest of Europe, the evolution of its manuscript painting follows a distinctive pattern determined in part by its location between northern Europe and the Byzantine empire. Significant, too, from the twelfth century on was the increasing understanding of the human figure and of space, fostered in part by the connections between manuscript illuminators and panel and wall painters (Alexander 1994, 121-122). These and other consistencies crossed political boundaries within a peninsula divided among different rulers, including the Lombards, the Byzantine empire, the papacy, and the Norman kings of Sicily; individual city-states such as Lucca, Pisa, Florence, Siena, Venice, Bologna, and Arezzo; and local rulers and powerful families.

These, in fact, as intersections of economic prowess and individual or group ambition, whether political or religious, were the sites of major manuscript production—for manuscript illumination was an expensive undertaking. Indeed, along with the analysis of palaeography and codicology and the identification and localization of decoration styles, the study of Italian manuscript illumination raises numerous contextual problems. For example, scholars have investigated the motivation behind the production of manuscripts. In the early Middle Ages, the primary producers of manuscripts were monasteries and court ateliers, and while some of the texts were classical and secular, the vast majority were liturgical texts and Bibles. Later, the development of cities, the emergence of the universities, and changes in the liturgy meant that new texts—such as the Missal, the one-volume Bible, and the *Decretals* of Gratian—were produced and new types of patrons emerged. The style of an individual painter or atelier, or even a region, might be affected by the agendas of patrons, and their political, religious, or familial alliances. And there are other questions. Who were the artists (Alexander 1994, 4-34)? Were they also the scribes? Were they monks?

Were they professional artists, working alone or in highly organized ateliers? On which projects did artists copy from valued exemplars? For which did they invent new programs of illustrations based on motifs book and written instructions (Alexander 1994, 52-71, 121-149)? Were court painters and ateliers common or rare? How far did artists travel? Some painters working in Italy appear to have been from England or from Byzantium, and documents in Naples in the thirteenth century refer to Mainardo Teutonico, who might have been German (Daneu Lattanzi 1978, 150; Evans and Wixom 1997, 479-481, 486). What does it mean when Italian artists appear to imitate aspects of the style of manuscripts produced in other political centers, such as Byzantium or Paris (Toubert 1980)? The following episodes from the history of Italian medieval manuscript illumination address these issues and others.

Although it is clear that manuscripts with narrative sequences were produced in Italy in the fifth and sixth centuries, as Backhouse has noted, "comparatively few miniatures of high quality survive from Italy" in the early Middle Ages (1979, 22). Certainly, the likelihood that the Codex Grandior—a huge one volume Bible—was among the books Benedict Biscop purchased in Rome and brought back to England in the seventh century indicates that Italian manuscript production was important during this period (De Hamel 1994, 17-21). A manuscript that does remain to us is the so-called Gospel of Saint Augustine or Cambridge Gospel (Corpus Christi College, MS 286), apparently one of the many codices sent by Gregory the Great to Saint Augustine to aid in bringing Christianity to the English in 596 (De Hamel 1994, 17). And an illustrated medical anthology attributed to Monte Cassino or southern Italy (Florence, Laurentian Library MS Plut. 73,41) survives from the early ninth century (Belting 1968, 122-132; Robb 1973, 163-164).

Despite these indications that Italy played an important role in the emergence of medieval manuscript ornamentation and illustration, it is in the tenth and eleventh centuries that we begin to see impressive and distinctive groups of illuminated manuscripts there. Three of the most prominent groups are the Beneventan school, best-known for the production of *exultet* rolls, the manuscripts of Monte Cassino, and the so-called Atlantic Bibles usually associated with Rome. One characteristic they share is a relationship to northern European

manuscript illumination, especially in their ornamented initials.

Among the earliest Italian illuminated manuscripts are some of the approximately thirty-three remaining *exultet* rolls produced in southern Italy, which date from the tenth century to the fourteenth (Avery 1936; Belting 1968, 144-183, 234-255; Cavallo 1973 and 1994; Evans and Wixom 1997, 469-472; Speciale 1991). These are unique Italian liturgical manuscripts which include the text of the hymn for the Easter vigil, *Exultet iam angelica turba coelorum*. Among the oldest are three that were originally attributed to a *scriptorium* at San Vincenzo al Volturno, but have more recently been attributed (Belting 1968, 154) to Benevento itself, between 985 and 987. Because of the history of the region, these manuscripts include varying degrees of Byzantine content in a figure style that is recognizably southern Italian. Some of these manuscripts are far more Byzantine in figure style and also have more elaborate ornamental repertoires, for example an *exultet* roll (Bari, Cathedral Archives, Exultet 1) and a benedictional (Bari, Cathedral Archives) made in eleventh-century Bari, which was the administrative capital of a Byzantine province in Italy beginning in 969 (Belting 1974, 14-19; Mayo 1987, 386-387).

Shortly after the production of the manuscripts at Bari, another group of southern Italian manuscripts was executed at Monte Cassino, where Abbot Desiderius's new basilica was dedicated in 1071. The *scriptorium* produced manuscripts that combined the now familiar southern Italian or Beneventan palaeographic and ornamental styles with an increasing absorption of iconographic and stylistic elements from Byzantine painting (Cavallo 1989). These Monte Cassino manuscripts include two homiliaries (Monte Cassino 98 and 99), as well as a lectionary (Vat. Lat. 1202) in the Vatican (Adacher and Orofino 1989; Newton 1979). Their southern Italian initial and ornamental style contains foliate trellises and an interlace inhabited by birds and canines. Scholars have noted that this ornamental style must have been affected by the presence of Carolingian and Ottonian manuscripts in Italy, sent as gifts by emperors, including the Vatican's Gospel of Henry II (MS Ottob. Lat. 74), which was given to Monte Cassino by Henry c. 1022 (Ayres 1994b, 134; Robb 1973, 171).

Another cluster of important manuscripts was the so-called Atlantic Bibles, generally localized to Rome, which take their name from their

colossal size (Ayres 1994a, b). These manuscripts, which have been associated with wall painting, are especially noted for their full-page *Creation* cycles, perhaps best seen in the twelfth-century *Pantheon Bible* (Vat. Lat. 12958) in the Vatican Library (Garrison 1953, 1.1, 83-89; 1955, 2.1, 21-44; 1961, 4.2, 117-178). The study of these codices involves considering Old Testament iconography, sorting attributions and localizations, and analyzing the relationships between Italian manuscripts and both transalpine and Byzantine painting (Ayres 1982 and 1994a, b). Other Roman manuscripts such as the Saint Cecilia Evangelary (Florence, Laurentian Library, Cod. 17, 27), have been discussed by Garrison (1955, 2.1, 36-38).

A twelfth-century Umbro-Tuscan style that combined some of the elements discussed above has been studied extensively by both Garrison and Berg, who described its initials as "geometrical," a type they traced to eleventh-century Rome (Berg 1968, 19; Garrison 1953, 1.1, 19-32 and 1954, 1.4, 159-175; *La pittura in Italia* 1985, 2:549). Consisting of ornamented shafts derived from northern European painting, the initials combine repeated rosettes and tight foliage in their interstices. They are embellished with gold leaf and, most significantly, with white vine foliage with half leaves, a form of decoration that became a permanent element of Italian manuscript illumination. A superb group produced at Pisa includes the brilliant Calci Bible (Certosa di Calci Cod. 1). In its decoration are figures copied closely from Byzantine manuscripts (Berg 1968, 146—168, 224—227; Garrison 1955, 2.2, 97-111).

In twelfth-century Sicily, a striking group of manuscripts was produced partly in response to the patronage of a powerful churchman whose political interests promoted a combination of Byzantine and Italian painting. Many are now in the Biblioteca Nacional in Madrid, but on the basis of their provenance and litanies, these manuscripts are usually attributed to Messina, during the archbishopric of the Englishman Richard Palmer in the second half of the twelfth century (Andaloro 1995, 357—378; Buchthal 1955; Daneu Lattanzi 1968, 15-33; Owens 1977). Among the most spectacular of these codices is a sacramentary, Madrid MS 52 (Evans and Wixom 1997, 479-481; Pace 1977). The ornamental style of twelfth-century Sicilian initials combines the Italian geometrical initial with elements of Byzantine ornamental repertoire and figure style (Buchthal 1955 and 1956).

By the thirteenth century, the expansion of the cities, the population, the economy, and the development of new religious orders—especially the Dominicans, Franciscans, Augustinians, Servites, and Carmelites—led to vast building programs and calls for new manuscripts (Corrie 1993). Among the centers for manuscript production, one of the most thoroughly studied is that at Arezzo (Lazzi 1990, 22-46; Passalacqua 1980). A distinctive style developed there, based in part on the geometrical style of twelfth-century Tuscany and Umbria, with white vine decoration as well as elements of figure painting that may have come from the powerful and dominant manuscript ateliers at Bologna. Indeed, throughout Umbria, at Perugia, Cortona, Assisi, and elsewhere, a variety of local styles arose, based on this combination, often showing the work and influence of painters of the *maniera greca* who executed local wall and panel painting (Lazzi 1990, 46-52; Marques 1987, 128-179; Morello and Kanter 1999, 140-147; *La pittura in Italia* 1985, 595).

Major issues in manuscript illumination can be articulated through the study of significant manuscripts produced in southern Italy in the thirteenth century. Some of these belong to the first half of the thirteenth century and are associated with Frederick II, but with a few exceptions even those with texts that were composed during Frederick's reign were actually copied and painted after his death (Mütherich 1974). The most important among these is the *Art of Hunting with Birds*, a text written by Frederick of which the earliest copy (Pal. Lat. 1071 in the Vatican Library) was made for his son King Manfred before 1268 (Willemsen 1969). This manuscript typifies an important group of illuminated manuscripts that includes medical anthologies and other scientific manuscripts (Kauffmann 1959; Petrus de Ebulo 1962). These manuscripts clearly belong to the mid-thirteenth century in the south; but in general, scholars are still not certain for whom they were made or where the ateliers were located. Moreover, these codices demonstrate how complex the meanings of such manuscripts can be. While they are secular in subject matter and indicate an interest in science, they are in part a means of elite self-identification and, as with the *Art of Hunting with Birds*, may be based on familiarity with luxurious manuscripts from the Arab world (Mariani and Cassano 1995, 155-159, 492-493). And as in the case of Cod. 93 in the Nationalbibliothek in Vienna, a medical anthology, they demonstrate an interest in simulating aspects of both

Byzantine and northern European painting (Grape-Albers 1977, 105-130, 151-164). Among the most important codices from Manfred's reign are elaborately decorated one-volume Bibles, a new type recently developed at Paris (Ayres 1994a, 361-374). Of these, the so-called *Manfred Bible* (Vat. Lat. 36) is the most spectacular, with a figure style that combines elements of French and English illumination with some Byzantine figure types, and a distinctive ornamental style based on a combination of English foliage and French details from the first half of the thirteenth century (Andaloro 1995, 393-412; Daneau Lattanzi 1968, 49-58; Toubert 1977 and 1980) *Federico II e' l'Italia* 1996, 258-262. Who were these painters? While many of the clients may have been members of Manfred's court, it seems likely that the painters were lay artists who worked in metropolitan centers such as Naples, which had its own university. The same difficulties can be found in the analysis of the slightly later manuscripts associated with the Conradin Bible, now MS 156 in the Walters Art Gallery in Baltimore (Corrie 1993 and 1994; Daneu Lattanzi 1968, 58-64; Toubert 1979). Although there has been some controversy over the localization of these manuscripts, this group too seems to be from southern Italy, possibly Naples (*Federico II e' l'Italia* 1996, 262-267). Other manuscripts seem to have been produced in Naples after the end of the Hohenstaufen rule in 1268 when the Angevin dynasty arrived (Daneu Lattanzi 1978; Degenhart and Schmitt 1977; Leone de Castris 1986, 103-108; Orofino 1994, 375-389). How political upheaval changes the history of manuscript illumination can be seen in Angevin documents, which indicate that there was a shortage of painters in Naples c. 1282 (Coulter 1944). And the Angevin takeover seems to have caused a shift in the types of manuscripts produced in southern Italy; there are more courtly and secular topics among the extant manuscripts. Southern Italy continued to produce manuscripts in numerous languages in addition to Latin, including Greek, French, and Hebrew, throughout the Middle Ages (Andaloro 1995, 349-356; Bologna 1974; Cavallo 1986, 497-612; Martini 1994, 351-59; Ševenko 1984).

While virtually every major city in thirteenth-century Italy produced some manuscripts, often with distinctive styles of illumination, without question the most important center for the production of illuminated manuscripts was Bologna (Conti 1981; *La pittura in Italia* 1985, 2:595,

602, 614, 640). Over a period of two centuries, the styles that developed there altered the evolution of manuscript production throughout Italy (Mariani and Cassano 1993, 132; *La pittura in Italia* 1985, 2:583, 598, 602, 611). Generally scholars have divided painting at Bologna into two styles (Norris 1993, 1-25). The "first style" of the 1260s and 1270s includes ornamentation based on knotted vines and lush half-leaf forms as well as marginal decoration including motifs taken from French illumination (Conti 1981, 21-22; Norris 1993, 1). Here the figures tend to be small and lively, similar to what can be found in the panel painting of the *maniera greca*. The "second" style, originally contemporary with the first, became more common c. 1280 and is associated with the so-called Gerona Bible Master (Luaces 1994, 415-427; Norris 1993, 2-4). These painters extended the ornamental repertoire found in the first style, and they developed a figure style remarkably close to that of the Palaeologan period in Byzantine painting (Jacoff 1979, 165-169).

Because Bologna was a university city, its manuscript illuminators decorated codices with a broad array of subjects (De Hamel 1994, 138-139; De Winter 1983). The Bolognese painters illuminated hundreds of one-volume Bibles, probably for use by university students, but also for the Dominican and Franciscan orders (Norris 1993, 26-98). And major manuscript illuminators, such as the Gerona Bible Master, provided sets of antiphonaries and graduals for the religious orders, including the Franciscans and the Servites (Conti 1981, figs. 86, 92, 93; Luaces 1994, 26-98). Because the university at Bologna was an important center for the study of law, numerous illuminated copies of the *Decretals* of Gratian were produced during the thirteenth and fourteenth centuries, among other texts (Melnikas 1975).

The ongoing study of Bolognese manuscript painting highlights crucial issues in the history of illumination, including the organization of ateliers, the sorting of hands and ateliers, and a continuing discussion of the identities of Oderisi da Gubbio and Franco Bolognese, mentioned by Dante in Canto 11 of the *Purgatorio* (Conti 1981, 7-8; De Winter 1983, 314-315; Norris 1993). Finally, a major issue is the relationship between painting in the Bologna region and painting outside Italy. A typical discussion has involved the origins of the style of the *Padua Epistolary* written at Padua by Giovanni Gaibana and dated 1259, which has been compared with both Armenian and

Byzantine manuscripts (Bellinati and Bettini 1968; Grape 1973; Hänsel-Hacker 1952). Eventually this atelier had an impact on painting in Austria and in Bohemia, as did subsequent Bolognese illuminators (Corrie 1987; De Hamel 1994, 218, 227).

By the fifteenth century, the shifts in the production of manuscript illumination had transformed the medium. As in earlier centuries, liturgical manuscripts were produced as texts were revised and wealthy patrons emerged (Alexander 1994, 11-20). But the desire of patrons to express their wealth and learning in private collections also directed the efforts of painters to illuminating classical texts, legal tracts, and new literature, such as the writings of Dante (De Hamel 1994, 232-286; Kanter 1994, 198-210). And although thirteenth-century manuscript illuminators can be found working on frescoes and altarpieces, we now find illustrious painters working in several media more often, including Pacino da Bonaguida, Simone Martini, Fra Angelico, Michelino da Besozzo, Perugino, and Pinturicchio (Alexander 1994, 230; De Hamel 1994, 232-286; Kanter et al. 1994, 25-83). Despite the dramatic changes in painting, especially the illusionism in the treatment of figures and landscape, quattrocento luxury manuscripts remain recognizably Italian, with an ornamentation that combines antique motifs with the white vine decoration that had dominated central Italian illumination in the twelfth and thirteenth centuries as well as the lush foliage of Bolognese illumination (Alexander 1994, 143, figs. 68, 121; De Hamel 1994, 244—253).

Painting: Panel

The art, and technique, of painting on a prepared wood surface is one of the oldest art forms known. The mummy cases of the pharaohs of Egypt are among the earliest surviving examples of using a wooden base covered with cloth and some sort of sealant as the surface for painting. We have testimony that the Greeks practiced this art, although no known examples have survived. Adjoining the Propylea Gate to the Athenian Acropolis was a structure called the *pinakoteka* (picture gallery) that was used at one time for displaying paintings on wood, although it is not certain that the structure was originally made for this purpose. The Romans practiced the art of panel painting along with fresco and other forms. A panel in the Etruscan museum in the Tuscan hill town of Cortona, painted in encaustic (i.e., pigments applied with soft wax) representing the muse Polimnia is claimed to come from the first or second century after Christ, although there is some doubt as to its authenticity. The mummy portraits that have been found in the Faiyum region of Egypt are in encaustic on wood and date to the first centuries of the Christian era. These panel portraits are Egypto-Roman paintings of undoubted authenticity. At least two paintings of the Madonna and Child in Rome—the *Madonna of Santa Maria Nuova*, in the church of Santa Francesca Romana; and the *Salus Populi Romani*, in the Lateran basilica—may date from as early as the fifth century and would be the oldest surviving Christian paintings on panel. From that

date onward, the number of surviving panel paintings gradually increases.

Throughout the Middle Ages and well into the Renaissance, painting on panel was one of the principal art forms practiced in Italy. This medium was not replaced by canvas as the major carrier of painting until the sixteenth century. Titian's *Assumption of the Virgin* in the church of the Frari in Venice in 1515 is one of the last major works on wood. Its tremendous scale, some 16 feet (nearly 5 meters) high, indicates the impracticality of using panel as paintings of monumental size became the vogue. Through the fifteenth century, however, wood was used for all manner of painting, from fine altarpieces to mundane objects of daily use. Related to panel painting for high art are types of decoration executed in similar technique for less lofty purposes such as the decoration of furniture and some forms of domestic ornamentation. The same techniques were applied to temporary works such as theatrical props. Even some types of book covers were a form of panel painting.

The most complete description of the technique of panel painting as it was practiced in medieval Italy is in a text written at the end of the fourteenth century or the beginning of the fifteenth by a minor artist named Cennino Cennini, *Il libro d'arte* (literally *The Book of Art*, but the English translation is called *The Craftsman's Handbook*). Cennini tells us that he was a pupil of Agnolo Gaddi, who in turn was the son and pupil of Taddeo Gaddi, who in turn was the godson and principal pupil of the artist considered the father of Renaissance painting, Giotto. Cennini thus establishes his bona fides as an authority on the best methods of painting. The book is a kind of shop manual that spells out everything an artist should do to produce the best kind of art. It is from Cennini that we get much of what we know about the practices of artists in medieval Italy. The fifteenth-century Florentine Leon Battista Alberti wrote a treatise on the art of painting published in both Latin and Italian (*Depictura, Deliapittura*; 1436); it deals more with the theoretical elements of the art and such considerations as the use of color, linear perspective, and composition, based on classical aesthetics. In our own time, the examination of actual paintings in the course of restoration and conservation has contributed significantly to our knowledge of the technique and materials used by artists of the Middle

The Panel

The production of a panel painting began with the carpenter who created the form, on the instructions of the artist or the patron. The most common wood used was poplar—a soft, open-grained, porous material. This is in contrast with the common practice of northern Europe, where various hardwoods were more frequently used. The planks were cut along the length of the log, following the grain of the wood in the same manner as our modern lumber. Except for the smallest paintings, which could be executed on a single width of wood (usually no more than 8 to 10 inches, or 20 to 25 centimeters), several pieces of lumber were needed. The planks were joined together with casein, a glue made from cheese, and size, a sort of gelatin obtained from boiling animal skins. Better-quality carpentry also used dowels, blocks, or butterfly wedges to reinforce the joints and horizontal battens that were attached to the backs for reinforcement. This was necessary because poplar is prone to warping. The planks were ordinarily used vertically except for such parts as a *predella* (the horizontal step or base on which an altarpiece rests), whose low, horizontal profile naturally indicated horizontal planking. The carving of the frame was considered a part of the panel preparation and might be carried out by the same carpenter who produced the panel, although a master carver might be employed if a particularly intricate design was called for. All this carpentry could be very complex, and it is not uncommon to find in surviving documents that the patron paid more for the carpentry than for the painting.

Once the carpentry was completed, the panel would be prepared for painting, usually by the artist (or his workshop assistants). The wood would be sealed with several coats of glue size prepared by boiling animal skins. The best size was made from the trimmings left from shaping sheets of parchment (prepared sheepskin) for manuscripts. Rabbit and other animal skins were used, but the size produced was not considered as fine. Included in the process of building up several layers of size was the attachment of strips of linen or parchment to the flat

surfaces (but not usually to the carved portions). This provided an additional layer of insulation from the potential dampness of the wood and also created a riding or floating layer that separated the layers of paint from the wood, which was susceptible to expansion and contraction with changes of temperature and humidity. The paint layer would thus "float" on the surface. The cracks that can today be seen in many panel paintings, where the joints of the panels have separated and pulled the painted image apart, are evidence of what could happen when this layer of cloth or parchment was omitted.

Gesso was then applied to the entire panel—frame as well as flat surfaces. *Gesso grosso* (coarse gesso) is a mixture of lime or chalk and size. The lime is ground to a fine powder and mixed with the size. Cennini suggests that at least eight layers of this substance should be applied. When each successive layer of the gesso was thoroughly dry, it would be smoothed with a scraper before the next layer was applied. When this process was complete, several layers of *gesso sottile* (fine gesso) were applied. This was a smoother form of gesso made by soaking the lime in water for about a month, stirring it daily and making sure it was kept too wet to set. After that time, the sediment would be kneaded to a fine texture. The gesso could then be allowed to dry like plaster if it was not to be used immediately. When needed, the *gesso sottile* would be mixed with water to a thin consistency and applied to the surface with a brush in very thin layers. After each layer was completely dry, the surface would again be scraped smooth before the next coat was applied. A well-prepared panel would be absolutely smooth, although not all panels received this meticulous attention.

The artist would then begin the process of creating the image. The drawing would be done directly on the panel. Until paper became readily available, in the fifteenth century, preparatory drawings were seldom used, although earlier paintings might be used as models. Pattern books that provided models for various types of images were also commonly used. This practice accounts for the similarity of so many images during this period and helps scholars discern relationships among various paintings and the artists who made them. The artist would draw with charcoal on the panel, "erasing" errors or making alterations with a feather. Once he was satisfied, he would brush off most of the drawing, again using a feather, leaving only a faint outline.

He would then trace out the lines with a fine brush and ink. In a few surviving examples in which the gesso and paint layers have become separated from the underlying panel, this preliminary drawing is visible where it has bled through the gesso onto the wood, giving us a glimpse into the artist's practice. Once the composition was complete, the panel was ready for gilding (the application of gold leaf), which was the common treatment for backgrounds and details such as halos. In a large workshop, the gilding might be done on the premises, but more commonly it would be sent out to a specialist.

The gold leaf was prepared by hammering a gold coin between sheets of leather, folding it over and continuing the process, much the way layered pastry dough is prepared. A gold florin, which is about the size of a U.S. dime, would ultimately render 100 sheets of gold leaf, each about 3 inches (7.5 centimeters) square. The sheets were so thin, virtually molecular, that they could be handled only with a brush and are translucent when held up to light. The size and number of sheets that could be produced from a given weight of gold were regulated by statute so as to guarantee the quality of the gilding. Since most devotional paintings were commissioned as acts of piety, the patron was frequently concerned that a given amount of precious material be expended in the production, as a sign of respect for the subject. It was therefore important that such quality control be exercised.

The gold leaf would be applied to all areas of the panel that were not to be painted. To start, a layer of bole would be applied. This was a type of red clay thinned with water that, when wet, acted like a glue to bond the thin sheets of gold leaf to the prepared panel. It had the additional property of providing an undercoat that enhanced the richness of the gold. The deep red color would show through the translucent sheets of gold leaf and would enhance the appearance, creating a more metallic-looking surface than a white underlayer could have produced. When the bole-leaf layer was dry, the gold would be burnished, polished to a high finish with a piece of agate or ivory. When burnished, the thin coat of leaf took on the appearance of solid gold.

The panel could then be tooled for additional richness. Gesso remains malleable virtually forever. A stylus could be used to impress an incised design into the surface, providing both pattern and texture. This would usually be done to halos, costumes, borders, and whatever other parts

would be appropriately ornamented. A compass could be used to create circular halos of concentric rings. Early in the fourteenth century, the use of punches became common. A design would be carved into the end of a cylinder of bone or ivory. This would then be pressed against the surface of the panel and struck with a mallet, leaving the impression of the design embossed on the panel surface. This allowed for a more regular and more intricate type of ornament than could be attained freehand. Punched designs and freehand incising were often combined. The incising and punching could be done either before or after the painting was completed, and evidence suggests that both practices were followed.

Because the punches were hand-carved, they generally had slight irregularities that allow their marks to be identified individually, much like fingerprints. This makes it possible to attribute various paintings to the same artist or workshop when it can be demonstrated that the same tool was used. Likewise, it can sometimes be shown that different artists were somehow related when they used the same tool. Such tools must have been considered valuable and were sold or traded among different artists and workshops.

After the gilding process was completed, the painting of the image could begin. Colors were obtained from mineral and organic materials. Naturally occurring minerals such as colored earths and hard stones would be ground to a fine powder to be used as pigments. Even precious and semiprecious stones were used. Lapis lazuli was frequently used for painting the Virgin Mary's mantle, because, like the gold leaf, it was expensive and thus demonstrated the devotion of the patron in his willingness to bear the expense. Flowers, fruits, and other vegetable materials would be boiled to extract the color. The infusion could then be evaporated, leaving only the colored residue. Insects were crushed to acquire clear reds and some other colors. Chemicals not readily available in a natural state would be manufactured. For instance, lead white was obtained by exposing strips of lead to vinegar vapor.

The most common medium for painting was egg tempera. Egg yolk would be mixed with the pigment and diluted with water to achieve the proper consistency. It would be applied with a small brush and tiny strokes. The yolk would dry to a very hard finish, as anyone who has left the breakfast dishes unwashed will know. Many layers of this paint

would be painstakingly applied to build up the form. Cennini specifies that the painter should divide his paint into three portions, leaving one portion pure, darkening one portion with black, and lightening the third with white, to create high, medium, and deep tones. Working from the middle tone, darkening the shadows and lightening the highlights, the painter would then build up the form of his image.

Certain pigments could not be used with egg yolk, so for these, other media would have to be used. For example, certain copper salts that were used for blue pigments would react to the sulfur in egg yolk and turn green. In such cases, the pigment might be mixed with glair, derived from the white of the egg. The egg white would be whipped to a stiff meringue and then allowed to settle. The clear residue that collected at the bottom would act as a suitable and nonreactive carrier. Because egg yolk produces an opaque appearance, glair was useful when transparent effects were desired, as in gems in a crown or on the decorative borders of garments.

Oil was used for some colors, especially when a similar transparent effect was desired. It could be used like glair for pigments that reacted with egg yolk. However, the opaque quality of tempera was generally preferred. The use of oil paint as the principal medium was not common until the sixteenth century and coincides with the introduction of canvas as a carrier, replacing panel. There are some examples of oil painting on panel, such as Botticelli's *Primavera*, but they are the exception.

Occasionally, objects were attached to the panel surface, although this practice is seldom found after the early fourteenth century. Actual gems might be glued to the surface, and holy relics in small containers could be inserted into prepared holes. Relief might be built up on the surface by gluing on small wood carvings and covering them with gesso or by building up gesso and then carving it into the desired form. This latter process would be done at the time of the gesso coating of the panel, before the gilding. This became a popular form of ornamentation in the international style of the fifteenth century and can be seen in such paintings as Gentile da Fabriano's *Adoration of the Magi* (Strozzi Altarpiece), in which many details such as the horses' trappings, the spurs of the Magi, and the talons of a hawk were produced in this way.

Uses of Panel Painting

The majority of panel paintings were produced for religious purposes, either public or private. Those meant for public display were most commonly intended for churches, although guildhalls and town halls might also have paintings of either a religious or a secular nature. The most common form was the altarpiece, although just what constituted an altarpiece embraces a broad spectrum of descriptions. The term has been applied to a wide variety of types and forms that were used on or near an altar. Devotional panels might also be found apart from an altar, such as the panels that decorated the piers in the cathedral of Florence.

Altarpieces took a variety of forms, which seem to have been popular at various times. A single panel, usually rectangular with a triangular pediment or arch at the top, was quite common in the thirteenth century. Later, the polyptych, a joining of several panels into a single unit, became more popular. A piece made up of three panels is called a triptych and was a common type. The central panel of a polyptych is generally larger than the others and honors the central theme of the altarpiece. In some early polyptychs, the panels diminish in size as they move outward, but in later examples the tendency was to make all side panels the same size. By the fifteenth century, the single-panel altarpiece with a horizontal format came into vogue.

Some triptychs had side panels or wings which were hinged so that they could be folded over to cover the central panel. In such cases, the shape of the wings would be that of the central panel split in two. Since the exterior of the wings would be visible when they were closed, the back sides would also be painted. In most instances, this painting would be only an ornamental motif, such as faux marbling, but in other cases more elaborate ornament might be used, such as a coat of arms or even additional figures. Such hinged triptychs are often referred to as tabernacles. A tabernacle might contain a sculptural image on the interior rather than a painting with only the wings painted. Alternatively, the wings might cover a receptacle for the eucharist, holy oils, or relics.

Some altarpieces that were placed on freestanding altars that could be seen from both back and front were painted on both sides. In this

case, the two faces were often differentiated in various ways. Duccio's *Maestà* altarpiece for the high altar of the cathedral in Siena has a devotional image on the front, the Virgin enthroned with saints and angels; and a narrative on the back, scenes from the passion of Christ. Giotto's *Stefaneschi Altarpiece* for Saint Peter's basilica in Rome shows Christ enthroned with saints on the front, while the back shows Saint Peter enthroned receiving the altarpiece itself from the hands of the donor, Cardinal Stefaneschi.

Panels were differently shaped for special circumstances. The most common type of shaped panel was the cutout cross. The cross would be formed with terminals at the ends of the arms. The central part of the cross might also be widened with an apron, so as to include the images of Mary and John or for scenes of Christ's passion. Although somewhat rare, there were also panels that were cut to the shape of the image painted on them, so that there was no background. This was, perhaps, a way of making the image seem more realistic or sculptural. In a few surviving panels, additions were attached to the panel surface. Some cutout crosses have the face of Christ painted on a circular panel that served as the halo. The circle of wood, flattened on the bottom, was attached at the neck, and the face was painted on it, so that Christ's head appeared to tilt forward. The same device was used in some images of the Madonna. In a few surviving examples, a carved face was attached so that the Madonna's head was actually three-dimensional.

Panels for private devotion were similar to those for public use but tended to be smaller in scale. The most popular form of private devotional panel was the hinged triptych. It could be closed when not in use so that the holy image would not have to witness the other activities that went on in the home, but it could be opened for devotions. Such tabernacles were also suitable for travel.

While the majority of surviving panel paintings were made for religious purposes, there is a sampling of secular works. The bulk of these are portraits. Portraiture was generally reserved for the wealthiest and most important patrons. The dominant portrait type was the profile, probably in imitation of classical coins and medallions. Portraits on panel were made for private homes and for public venues. Furniture was often painted in the same manner as panel painting, although surviving examples suggest that the preparation was not as elaborate.

Chests known as *cassoni* for the storage of clothing and other household goods were decorated with paintings on the fronts, sides, and lids. Chair backs, bedsteads, and other household furnishings were frequently painted.

Another type of panel painting, which is not well understood, is a circular panel known as a *desco di parto* (plural, *deschi di parto*) or birth salver. Such a panel takes the form of a circular tray, usually painted with a religious subject on the main side—often a subject of birth, such as the birth of Christ, the birth of Mary, or the birth of John the Baptist. The reverse side was generally decorated with coats of arms or emblems. Since *deschi* were often known to be given as wedding gifts, it is thought that they were intended as talismans for the fertility of the marriage and may have been used to bring ceremonial refreshment to a new mother. The *desco di parto* may be the origin of the circular panel called a *tondo* (plural, *tondi*) that became especially popular in the fifteenth century, when we find numerous examples of such circular panels which, owing to their size and weight, could never have been used in such a ritual manner.

Book covers for civic registers were sometimes painted much in the manner of panel paintings. Like furniture, these did not always get the more elaborate preparation accorded to the best altarpieces. Small chests, probably used to keep treasure, were sometimes decorated in the same way.

Condition and Conservation

Because of the fragility of panels, relatively few of them have survived, and even fewer are in good condition. From comparisons between workshop records that indicate how many works were produced and the actual number that have come down to us, it has been estimated that less than 5 percent of fourteenth-century panels survive; the percentage becomes even smaller for earlier works. Panels are subject to a variety of hazards. The wood itself—poplar—is quite frail, unlike the oak and other hardwoods used in northern European panel painting. It is subject to woodworms, dry rot, and other types of natural damage. Changes in temperature and humidity can adversely affect the

condition of the wood. Since so many panel paintings were placed on altars with lighted candles, fire was another hazard that claimed many.

For centuries, the conservation of panels, if done at all, consisted of cleaning the surface with abrasives, which in time removed layers of paint, often down to the preliminary underpaint. This explains the green tint seen in so many faces. *Terra verde* (green earth) was the common pigment used as the base color for flesh, although it would have been hidden beneath the many layers of other pigments. Excessive cleaning over time has removed these upper layers of paint, revealing the underlayer.

In trying to conserve panels today, museum laboratories have to contend with all these conditions. Woodworms can be controlled fairly easily by fumigation. The other problems are less easily treated.

Warping of the wood is generally irreversible, and the concern is prevention of further deformation. This can be achieved to some degree through environmental control, maintaining constant conditions of temperature and humidity. Continual change in the environment is more damaging than a hostile but consistent environment. In severe cases, it may be necessary to cradle the panel. This consists of attaching to the back side an interlocking series of horizontal and vertical struts, the inner side of which is shaped to fit the back of the panel. This reinforcement serves to keep the panel from warping any further.

Deterioration of the wood is another serious problem. Chemical treatment of the wood fiber can stop further deterioration, and if the problem has not advanced too far, injection of material into the wood can stabilize it. If the problem has advanced too far, however, it may be necessary to remount the painting. This is a very delicate operation and is undertaken in only the most severe cases. A sheet of material is glued to the surface of the painting, to stabilize it during the procedure. The painting is laid facedown, and the wood is carefully carved away until nothing but the gesso preparation is left. Then a new piece of wood, usually something like masonite, is glued to the painting. The stabilizing cover can then be removed from the picture surface.

Other problems that afflict panel paintings are chipping, flaking, and splitting of the surface. When the paint layers begin to separate from the panel, usually as a result of environmental conditions, they can be reattached by injecting glue beneath the surface and applying pressure

to fuse them together. Likewise, if the paint has become completely detached, it can be glued back in place if it is found. However, when paint is lost, present-day practice is to stabilize the area as much as possible and then to inpaint only to the point of avoiding any jarring hole in the picture. Modern conservators do not try to return a damaged work to pristine condition, so that the viewer will know what is and what is not genuine. When the wood has split and taken the paint layer with it, there is little that can be done. Cradling can help prevent further damage, but the appearance of the painting can be helped only by filling the crack and, if it is deemed best, inpainting the area.

A related art form is the polychromed sculpture found in medieval and Renaissance Italy. In one sense, polychromed sculpture is three-dimensional panel painting. The sculpture would be carved from wood, often the same poplar that was used for panel painting. The surface would then be prepared with gesso and linen strips and painted with the same egg tempera as a panel. Gilding, the insertion of gems and other objects, and other modes of ornament would be the same as those used by panel painters.

Pala d'Oro

The *Pala d'Oro* is a Gothic altarpiece, combining Byzantine enamel work with Venetian decorations, in the basilica of San Marco (Saint Mark) in Venice. The altarpiece was created in the workshop of the Venetian Paolo Bonensegna c. 1349. Set within a heavy gold and silver frame (10 feet 4 inches by 6 feet 10 inches, or about 3 by 2 meters) are more than 250 enamels and thousands of jewels and pearls. Stylistically, the enamels appear to have been made in Constantinople during the tenth and twelfth centuries, and they may have come to Venice among the booty of the Fourth Crusade. Paolo Veneziano's famous cycle, the *Miracle of Saint Mark*, was painted on the feriale (wooden case) built to enclose the altarpiece.

The *Pala d'Oro* has two framed segments. The top, the part that folded down, has a central medallion of the archangel Michael flanked by six large gold enamels, representing six of the twelve important feasts identified by Byzantine iconography. These are surrounded by numerous smaller enamels, placed among decorative motifs and floral mountings for gems and pearls, all on a gold background. The heavy frame of chased gold incorporates more miniature enamels.

The larger bottom segment divides into three verticle sections. The middle section focuses on a large medallion of Christ enthroned. Around this are representations of the four writers of the Gospels. In a lower register, images of Empress Irene and Doge Ordelafo Falier and two inscriptions surround an *orans* Virgin. In the upper register, angels and cherubim flank a representation of the second coming—a throne supporting the Bible and cross. The two side sections both have three registers which each contain six figures. On both, the top register contains named archangels, the middle register contains apostles, and the bottom register contains prophets. Between the frame and the enamels on the sides and top are an additional twenty-seven small pictures—made at an unknown date, possibly for a European patron—showing the story of Saint Mark, more scenes from the life of Christ, and six deacons. The frame and regions between enamels are done in the same fashion as the top segment.

Palatine Chapel

The Palatine Chapel or Cappella Palatina in Palermo was built as the chapel of the royal palace there under the Norman kings of Sicily in the twelfth century. Although there may have been an earlier building on site that served the same purpose, the present edifice was begun under Roger II (r. 1130-1154), the first of the Normans to rule the island as king, who was substantially responsible for its architectural form and decoration. Additions and changes were executed under William I (r. 1154–1166) and William II (r. 1166-1189); however, almost every culture that occupied the island thereafter also left its mark on the chapel in one way or another.

Although it is convenient to think of the Palatine Chapel as an autonomous edifice, it was in fact constructed as an integral part of the palace—as a room or set of rooms. It is in this context that certain aspects of the building, such as the main entry from the south and the royal loge once in the northern transept arm, can be explained. The main interior space of the chapel consists of a nave flanked by aisles to the west and a domed sanctuary with three apses to the east. The chapel is richly outfitted with decorations and furnishings almost all of which date from the twelfth century.

In an interior as narrow as that of the Palatine Chapel, the degree to

which ceilings and vaults are the focus of attention is remarkable. After one enters the chapel from the narthex, one's gaze is almost inevitably drawn to the wooden ceiling of the nave, painted and gilded with figures, ornaments, and inscriptions, and executed in part in the *muqarnas* (stalactite) technique. The nave ceiling finds its closest analogues in the Islamic world (Fustat, Fez), from which the inspiration for it must have come. With its images of drinkers, dancers, and musicians, and its inscriptions in Arabic, it casts a decidedly unecclesiastical spell over the chapel space, especially in contrast to the decoration of the nave and aisle walls with scenes of the Old Testament and the lives of saints Peter and Paul in mosaic. These scenes were not added until later, probably under William I, and may not have been part of the original plan for the decoration of the western portion of the chapel. In fact, in its original version under Roger II, the nave of the Palatine Chapel may convey more of the impression of a secular audience hall, with tapestry-lined walls that framed a place at the west for the king, a throne platform, which was then rebuilt under William II. It was also under William II that the image of Christ flanked by Peter and Paul was added to the west wall above the place where the king presumably stood, recalling a similar arrangement in the great palace of the Byzantine emperors at Constantinople. The pulpit and paschal candelabrum in the south aisle were also added to the chapel during the reign of William II.

The liturgy was staged at the eastern end of the chapel, in a space resembling a Byzantine church. This space is dominated by a high dome into which was inserted, during the reign of Roger II, a great image of the Pantocrator at the summit, and then—in descending stages outward and downward from the summit—angels, prophets, evangelists, and scenes from the life of Christ. This arrangement follows Byzantine convention up to a point. The most interesting departures from Byzantine norms occur in the two transept arms, and these idiosyncracies have been explained in terms of a royal point of view embodied in the king as he stood on a balcony in the northern transept arm. A trace of this balcony is still to be seen in the chapel.

Palatine Chapel, Palermo, mosaics in the apse and dome. Byzantine, twelfth century. Photo: © Scala/Art Resource, N.Y.

The Palatine Chapel represents twelfth-century art patronage of the highest order; it is an extraordinary ensemble of materials, techniques, and styles. The pavement and wall revetments make extensive use of porphyry, serpentine breccia, and other colored stones in a variety of intricate ornamental patterns. The iconic and narrative mosaics that cover the upper walls of the entire chapel and the vaults of the eastern end are executed on a scintillating gold ground. The painted wooden ceiling of the nave, too, is resplendent with gold, though this has been beclouded with the grime of years and by numerous, often clumsy restorations. In addition, the chapel is outfitted with a set of bronze

doors to the west, and many elements of carved marble (capitals; pulpit and paschal candelabrum). These decorations, embellishments, and furnishings, which were executed by artists and artisans with different cultural roots and affiliations—Byzantine, Islamic, and western—stand as testimony to the power of Norman patronage and the richness of the visual culture of Sicily in the twelfth century.

Paleography

Thus writing, which is primarily but the humble medium for recording the deeds, thoughts, and interests of an age, by dint of being itself an art, becomes at once an expression and a register of the spirit which informs that age. Herein lies the peculiar interest that writing has for the student of culture in general

(Lowe, 1914).

Paleography, strictly speaking, is the study of old handwriting. A paleographer looks at the script—the handwriting of the volume or leaf before him or her—in order to determine where and when it was

written, and for what purpose. A large, well-spaced capital-letter script, with few abbreviations, is easy to read but would be slow and expensive to produce, since the scribe worked letter by letter. Such scripts are appropriate for liturgical books and works of reference. A small, cursive script, in which letters are linked together so that the scribe writes word by word, can be written more rapidly, but—especially when abbreviations are used—can be more difficult to decipher. It is more likely to be used for documents or for private reading. Both kinds of script existed from antiquity, in forms that developed and changed over time, sometimes slowly and sometimes with startling suddenness. The trained paleographer looks at the forms of individual letters, the ligatures that link one letter to another, the abbreviations that are used, and the *ductus*, or duct, which is the look of the hand on the page. The writing may be upright, or slanted as in italic scripts, or splayed out as in Gothic text hands. Letters may be well-spaced or compressed. Strokes may be evenly weighted, as they are in most modern typefaces, or they may alternate between thick and thin lines of the pen. All these features make up the duct of a script.

Only a few of the surviving manuscripts tell us explicitly where and when they were written. The ancillary study of codicology—the physical aspects of the book or codex—can frequently help to date and locate a volume. Codicology includes factors such as decoration and illumination, binding, the general layout of the page, including prickings and ruling and the relative proportions of margins and written space, the presence of quire signatures or catchwords, and the kind of parchment or paper on which the manuscript is written. Modern manuscript scholars are rarely simply paleographers, but script remains the key element in their research and is the central focus of this article.

Most scholars differentiate between paleography, which concerns the writing found in books or parts of books, and diplomatics, or the writing of documents. But the same scribes frequently wrote both, and book scripts borrow abbreviations and cursive features from documents. Epigraphy, or writing carved in stone, is a third category, which influences and is influenced by the more formal book hands. As both inscriptions and documents are dated more frequently than book manuscripts, they provide useful points of comparison and will

sometimes be mentioned here.

In the classical period, literary texts as well as documents were written on rolls of papyrus, with the writing in columns parallel to the short side of the roll, horizontally across the fibers. The reader would unroll the manuscript from left to right. The few surviving examples are in Roman square or rustic capitals. Square capitals are so called because the letters are of equal size, and as broad as they are high. Straight lines are either upright, as in I and the first stroke of M or N, or at a 45-degree angle, as in the second and third strokes of M. The letter A forms an isocles triangle; O is a perfect circle; C is a semicircle. These classical forms survive in the uppercase letters of most modern typefaces: ABC. This was the standard script for inscriptions in the classical period, and a few surviving manuscripts use it.

By the fifth century, however, a more compressed and irregular display script called rustic capitals was in use for both inscriptions and manuscripts. In this script both N and M are noticeably wider than other letters, whereas L, I, and T are narrower and frequently a little taller as well. The letters O and Q are elliptical rather than round; A is slanted, often losing its crossbar; and V has been replaced by a more rounded U. Materials had also changed by this time. The surviving manuscripts are on vellum. (Etymologically, vellum comes from calves and parchment from sheep; but the better-stripped and finished the skin was before writing, the harder it is to identify the original animal, and in English the two words are usually interchangeable. The Italian term for any animal skin, whether sheep, cow, or goat, is *la membrana*.) Also by the fifth century, the codex, or bound book, was replacing the roll. A codex was heavier but sturdier; and when it was used for luxurious volumes, the illustrations survived better. Two illustrated fifth-century manuscripts of Virgil in rustic capitals—the *Vatican Vergil* (Vatican Library Cod. Lat. 3876) and the *Vergilius Romanus* (Vatican Library Cod. Lat. 3225)—are well reproduced in Weitzmann (1977).

Letter-forms such as widened and heightened M and N come from the more rapidly written hands used in business and military documents, and for note-taking on wax tablets. Cursive inscriptions have been known from the walls at Pompeii and from papyri of Roman Egypt for more than a century. In 1973, a large cache with more than 100 tablets was uncovered at the Roman-British fort of Vindolanda

along Hadrian's Wall. Written either on wax tablets or directly on thin wood, between A.D. 95 and 105, they use the same kind of cursive found in Egypt and Pompeii. Forms that are the antecedents of our lowercase letters include a, b (which resembles a modern d), and p; they mark the appearance of the minuscule cursive script that is frequently called younger cursive, to distinguish it from an older cursive retaining majuscule forms. Majuscule scripts like Roman capitals can be written between two lines; minuscule scripts are four-line scripts, with ascenders on letters like b and descenders on p and q.

These are the scripts that developed into the formal and informal book hands of the Italian Middle Ages. The first distinctive Italian majuscule script is traditionally called uncial, from its inch-high letters. Lowe (1914) pointed out that the most distinctive of these are rounded forms of a; d with a rounded, not upright, back; e like the modern lowercase form; and a rounded m, in which the first and last strokes are not upright but curve inward at the base. Hence, it is known as the "adem" script. The most famous example is the sixth-century *Codex Amiatinus*, now in the Biblioteca Laurenziana in Florence. It is a copy of a lost Bible manuscript made for Cassiodorus (479-576) in his *scriptorium* at Vivarium, the earliest Italian monastic *scriptorium*. The *Amiatinus* itself was intended for, and may indeed have been copied at, the Anglo-Saxon monastery at Wearmouth-Jarrow in Northumbria. Other uncial Gospel books survive at Vercelli and at Fulda, the monastery of the Anglo-Saxon missionary Boniface. From Italy, books in uncial script spread across Europe with the spread of Christianity. Of more than 400 extant uncial manuscripts written between the fourth and the eighth centuries, Ullman has noted that only twenty-four contain classical texts. There are a few legal and technical writers, but the bulk of the uncial manuscripts are those of biblical, liturgical, or Christian writers such as Augustine and Jerome.

"Half-uncial" is the traditional term for a mixed uncial and cursive script that also appeared in the fifth to eighth centuries; the characteristic letter-forms are its single-compartment a, g shaped like the numeral 3, upright d and m, and b in the modern form. The capital form of N was usually retained. Ligature, like the linking of e and t (which survives in the modern ampersand, &), appears, as does a quicker form of the æ ligature, with the a reduced to a cedilla under the

e. Though half-uncial remained more formal than cursive, it was faster to write than uncial and was often used in less luxurious copies.

All the scripts discussed so far show little, if any, local variation. We know that the cathedral library of Verona possessed a rich library of uncial and half-uncial manuscripts because they have remained there, not because we can identify specifically Veronese features of the scripts. But when we come to the cursive hands that preceded the reforms of the Carolingian empire, local characteristics do emerge. The traditional explanation for the Irish small compressed minuscule hands—heavily abbreviated, but with clear word division—is the relative scarcity of sheep and cows, though sheer delight in intricate design has also been suggested. In any case, Irish minuscule entered Italy when the Irish monk Columbanus arrived at Bobbio in the valley of Trebbia in 612. By the tenth century, the monastery of Bobbio had a collection of more than 700 volumes, including twenty-five surviving volumes dating from before the seventh century. Parchment may also have been scarce in northern Italy, for the fourth-century rustic capitals manuscript of Lucan was scraped down and covered with writings of Jerome in minuscule of the eighth century. The resulting palimpsest is now in the Biblioteca Nazionale of Naples (MS Lat. 2).

At Bobbio, minuscule hands retained a strong Irish influence throughout the eighth century. Manuscripts in localizable minuscule scripts also survive from Lucca, Vercelli, Novara, and Verona. However, by c. 800, Charlemagne's political power brought the new approved script of the empire, Caroline minuscule, to northern Italy.

South of Rome, however, the imperial influence was not present. The pointed letter-forms of the script of Luxeuil were the basis for the style that developed at Benedict's foundation of Monte Cassino. There is a careful alternation of thick and thin strokes of the pen, and the writing slants to the right. Instead of making the standard minim stroke—used in i, u, m, and n—as a single straight line, the scribe pivoted his pen, producing three strokes, the top and bottom ones thick and angled downward and the middle stroke thin and upright. These are known as broken strokes, and they are the dominant characteristic of Beneventan script. Ascenders and descenders are finished off with thick, slanted, horizontal, broken strokes. A long i descending below the level of most letterforms is used in ligature. A broken-backed form of e, developed for

ligatures with other letters, became the normal form for all e's. The letters o and c were no longer rounded but lozenges, with the top and bottom strokes thick and the side strokes thin. Where possible, letters were linked along the top horizontal line of the body of the letterform: m could be linked to the crossbar of t or the top of p, or the tongue of e. Beneventan scribes also used abbreviations wherever possible; flat strokes over vowels indicated a missing m or n, and special marks indicated -us, -or, or other common syllables. The result is a script that is visually arresting but difficult to read. Despite the difficulty, it persisted in the region of the medieval duchy of Benevento, of which Monte Cassino is the center, from the tenth century to the early fourteenth.

In the same area, *exultet* rolls gave the liturgical text of the *exultet* psalm recited in the Easter liturgy. The earliest examples are of the late eighth or early ninth century, and the latest are of the twelfth or thirteenth century. The script is almost always Beneventan. The vellum rolls are written to be unrolled over the pulpit as the priest recited the verses; illustrations are included in most surviving examples, upside down in relation to the text, so the people in church could see them.

North of Rome, however, Charlemagne's reforms of handwriting, favoring legibility over art, prevailed. As Ullman (1932) tartly noted, "The term Carolingian, or Caroline, rests on the belief that the script sprang full-grown from the brain of Charlemagne, with Alcuin standing by as mid-wife." In fact, Alcuin's monastery at Tours was an important center of dissemination of the new script, but it spread rapidly. It is a clear, rounded script, most of whose letter-forms are half-uncial. Ligatures are few, being limited to ct and et, and abbreviations are also infrequent.

Gradually the 3-shaped g gave way to g shaped like an 8, with both upper and lower compartments closed. Early Caroline minuscule borrowed from the Visigothic script of Spain an a shaped rather like an italic u, open at the top and slanted to the right. Both round-backed uncial d and the upright form appear. Ascenders and descenders are finished with a twist of the pen that produces a club or wedge shape at the end of the ascender shaft, and a small curve to the upper right on the descenders of minim strokes in i, m, and n.

Carolingian scribes could write in more than one style, and

Carolingian manuscripts frequently show a clear hierarchy of scripts, with square and rustic capitals used for headings and explicits, and uncial and half-uncial for first lines, prefaces, or bits of text that needed highlighting. The resulting manuscript was impressive to look at and easy to read, and the style persisted, like Romanesque architecture, from the ninth to the twelfth centuries. These carefully designed Caroline codices inspired the scribes of the Renaissance to introduce yet another reform at the close of the fourteenth century.

But between Caroline minuscule and the Renaissance lay another set of developments in script, as in architecture. Elsewhere in Europe, the term "Gothic" applied to a book script implies broken strokes and a pointed, angular appearance, resulting in the sort of script found in books of hours. But in Italy, the normal *scrittura gotica* remained a rounder script, characterized by curves rather than sharp angles, and with fewer decorative hairline strokes at the end of letters. Sometimes, as in Boccaccio's hand, ascenders of b, h, and I had faint hairline finials across the top. This style is often called *gotica rotunda*. The descent of the standard Italian book hand of the thirteenth and fourteenth centuries from Caroline minuscule is easy to see. The headed form of a, sometimes closing up into a two-compartment form, remained the norm, as did the 8-shaped g. Fourteenth-century Italian book hands were rounded, with short ascenders and descenders and closely linked letters. Round-backed d was often used. Whereas the 7-shaped abbreviation for the word *et* (or *e* in Italian) was usually crossed elsewhere in Europe, in Italy it remained uncrossed. Red ornamental capitals were often flourished (decorated) in purple, rather than the blue favored elsewhere, and the decorative flourishing lines were long and thin. Miniatures were often placed at the bottom of the page, rather than in the text blocks.

This kind of handwriting continued to be used for literary and scientific texts. When well spaced, it remains easy to read. But compression saves space, and space saves parchment or paper. Letters were linked across the top, and joined onto each other, so that letters like *do* would appear to share the middle rounded stroke, a device often called biting.

In the legal manuscripts that emanated from the University of Bologna, a central block of text is flanked by glosses, in a smaller, more

abbreviated version of the same hand. This *scrittura bolognese* makes extensive use of bitings and leaves little space between lines or between words. The scribes who produced it were professionals, working on the *pecia* system—i.e., paid by the piece—and their standard remained reasonably high, but their work is still difficult to read for long stretches.

Along with formal book scripts, cursive handwriting, called *cursiva* or *notula* (*nottula* in Italian), continued to develop, not just for use in documents but for glosses and books produced by individuals who wanted fast, cheap copies of texts. Groups of letters, or even entire words, were clearly faster to write. Letters were linked to the following letter with hairline strokes; d acquired a looped back for the purpose. Following the models set in the papal chancery, such scripts have long ascenders and descenders, including forms of f and long s that descended below the line. When carefully written, such hands remain easy to read. And individual scribes would develop hands that combined some of the rapidity of *notula* with letter-forms from book hands; the result is usually called *bastarda*. Many scribes wrote different styles of hands for different occasions. Petrarch, for instance, wrote a *textura* for fair copies and a *bastarda* and *notula* for less formal use.

The humanist book script that is probably the best-known of all Italian types emerges as a reform, a return to the high standards of Caroline minuscule, just at the end of our period, a little before 1400, in Florence. Both the upright variety and the slanted italic script spread across Europe, and their influence is clear in modern printed typefaces.

Palermo

History

Palermo, known in antiquity as Panormus, was originally a major city of the Phoenicians. It came under the increasing influence of the Greeks

following their defeat of the Carthaginians at Himera in 480 B.C. In the course of the Punic wars, Palermo came under Roman control and developed as a major port city of the republic and the empire. With the collapse of Roman power, it was seized at various times by the Vandals of Gaiseric and the Ostrogoths of Theodoric. In 535 Justinian's general Belisarius brought it under Byzantine rule, which continued until the Saracens seized it in 831 and made it the capital of the powerful emirate they established in Sicily.

Under the Saracens, Palermo became one of the great cities of the Mediterranean world, the equal of Cordoba and Cairo in commerce and in culture. Not until two centuries later were Palermo's Arab glories superseded by the beginnings of the Norman era. In 1072 Count Roger I of Hauteville, younger brother of Robert Guiscard, seized the city and made it the capital of the new Norman regime. Roger's son, Roger II, expanding power on the mainland at the expense of his cousins, had himself formally crowned with the title of king on Christmas day 1130 in the cathedral in Palermo. The city continued as one of the capitals of Norman southern Italy and the capital of Sicily itself through the ensuing Norman and Hohenstaufen era.

Dazzled by the richly diverse Arab, Greek, and Latin culture flourishing in Sicily, the new Norman masters created and enjoyed a multicultural assimilation, as the monuments of their artistic and intellectual patronage testify. Palermo's vivid cultural life was further expanded by Frederick II, who made his court there a center for poets, philosophers, scientists, and other scholars. The Italian literary tradition began at this court with the lyrics of such poets as Giacomo da Lentini, Piero delle Vigne, and Guido delle Colonne. The defeat of the Hohenstaufen and the introduction of French rule under Charles of Anjou inaugurated a period during which Sicily became a center of international contention. According to tradition, the incident of 31 March 1282 known as the Sicilian Vespers occurred in the church of the Santo Spirito on the outskirts of Palermo, leading to the expulsion of the Angevins and the introduction of Aragonese rule in Sicily. Under Peter III and his successors, Sicily enjoyed general prosperity and peace, even though its Aragonese rulers were intermittently drawn into conflict with the Angevin dynasts on the mainland.

Monuments

Almost nothing survives of Phoenician and Roman Panormus; and except for a few fragments, everything that had been constructed during the two centuries of Arab rule was obliterated, deliberately and all but completely, in the era of intolerant Spanish rule. Something of the splendor of Sicily's Islamic culture was, however, brilliantly assimilated into the city's medieval Christian culture, thanks to the multicultural tastes of the Norman rulers, partially extended under the Hohenstaufen.

The earliest Norman structure in Palermo—indeed, one of the earliest of all surviving Norman churches in Italy—is the church of San Giovanni dei Lebbrosi, built (according to tradition) c. 1070 by Roger I, but possibly refurbished by Roger II, who attached to it an asylum for lepers. It is built on a strict basilican plan, topped by a cupola colored red on the outside in characteristic Norman-Sicilian style. From the time of Roger II himself survive the charming remains of the church of San Giovanni degli Eremiti, built 1132-1148 and incorporating earlier structures, apparently from an Arab mosque. Attached to this church is a romantically ruined cloister, and the whole ensemble is now preserved within a picturesque garden complex.

Church of San Giovanni degli Eremiti, Palermo. Photograph courtesy of Christopher Kleinhenz.

Not far away is the massive Norman palace, built on Saracen foundations, much expanded and modified later in the era of Spanish rule, and now the seat of Sicily's parliament. Much of its Norman core still survives, including parts of the Norman royal apartments. Most interesting of these is called the Sala di Re Ruggero; its walls are sheathed in marble and its ceiling is decorated with twelfth-century mosaic scenes of nature and hunting.

Apse of *duomo*, Palermo. Photograph courtesy of John W. Barker.

The most important feature of the palace, and perhaps the jewel of Norman art in Sicily, is the Palatine Chapel (Cappella Palatina), begun by Roger II in 1142, the foundation charter having been issued in 1140. In its vestibule is an inscription of 1143 celebrating Roger's building of a water clock; the multilingual text (Latin, Greek, Arabic) testifies to the multicultural character of Sicily, which was cherished by the Norman rulers. The church is laid out on a small basilican plan: according to some interpretations it began as two separate rooms—a small chapel in Byzantine style adjoining the royal apartments, and an audience hall in Saracen style—that were then combined into one. The high arcade of the nave is supported by ten reused Roman columns, and the top of both the nave and the side aisles is covered with an elaborate wooden ceiling decorated richly with Arab secular paintings. The lower walls are covered with marble, topped with abstract Arabic designs; the floor is decorated with rich marble geometric patterns. Before the raised choir, on the south side, is an elaborate pulpit and a stone paschal candelabrum, in the finest Norman Romanesque style. Parts of the choir have been heavily altered, but the conch of the central apse preserves the earliest of the great Byzantine-Norman mosaics of Christ as Pantocrator. The walls, vaults, and dome of the church are covered with dazzling mosaics; the initial cycles were executed by Byzantine artists

during the 1140s, following essentially traditional Byzantine iconography and disposition. The medallion of Christ Pantocrator is set in the cupola, surrounded by archangels, above figures from the Old and New Testaments. Scenes from the life of Christ adorn the presbytery walls. The mosaics of the nave date from the period of William II. Along the upper walls of the nave and above the arcades are bands of scenes from the Old Testament, beginning with the creation and ending with the story of Jacob. Along the side aisles other mosaics represent episodes from the Book of Acts, primarily concerning saints Peter and Paul. These two saints also appear in a fifteenth-century mosaic, on either side of the enthroned Christ, symbolically placed over the much-revised royal throne as the chapel's west wall.

Two other examples of Norman palaces survive in Palermo, though much transformed. In royal parks on the fringe of the medieval city, the twelfth-century monarchs built summer palaces in explicitly Arab style. The gardens, with their cooling fountains, are long gone, and the surviving buildings have been dreadfully mutilated over time. One of them, the Cuba (from the Arabic *kubeh*, "dome"), built by William II and mentioned by Boccaccio in the *Decameron*, is dilapidated and inaccessible amid a modern military installation. The other, William I's Zisa (Arabic *el aziz*, "the magnificent"), has, however, been restored after postmedieval remodeling, modern decay, and even partial collapse, and has now been developed as a museum of Arabic culture in Sicily. It is a marvel of Islamic Mediterranean design, with beveled interior arches and hydraulic systems cunningly contrived to circulate air, with a remarkable cooling effect. Its top floor was originally open to the sky, and at its ground-floor facade a water outlet is decorated richly in Norman mosaic.

Close to the Cappella Palatina in date (perhaps slightly earlier) and parallel in its original decoration is the church of Santa Maria dell'Ammiraglio, now popularly known as the Martorana, begun in 1143 by Roger II's powerful admiral George of Antioch. In 1433 the church was given to a convent founded by one Eloisa Martorana, from whom it has taken its popular name. The western part of the church was greatly expanded and rebuilt in 1588, incorporating it into a twelfth-century campanile. Of its revised interior, the original eastern part of the church, in the form of a Greek cross, is richly decorated in

mosaics executed by Byzantine artists. Its dome contains the Pantocrator medallion with conventional accompanying figures; major mosaic panels show scenes from Christ's life, with portraits of saints Anna and Joachim. The pavement of polychrome marble is very fine. Relocated to the sides of the rebuilt atrium are a pair of mosaic panels: the panel on the north side shows George of Antioch prostrate before the Virgin; the panel on the south side shows a famous and politically potent image of Roger II, garbed as a Byzantine emperor, being crowned by Christ.

La Zisa, Palermo. Photograph courtesy of John W. Barker.

Immediately adjacent to the Martorana is another interesting church produced by private Norman patronage. This is the chapel of San Cataldo, built by William I's chancellor, Maione di Bari, whose premature death in 1160 prevented the internal decoration from being carried out. The bareness of the chapel, however, allows close study of the masonry construction, especially that of its three domes on squinches. Rescued from degeneration and restored, it is now the headquarters of the Knights of the Holy Sepulchre. One other testimonial to twelfth-century private benevolence brings us back to George of Antioch: the Ponte d'Ammiraglio, built in 1113 at the southern end of the city, originally over the Oreto River. The river was

later diverted, and the bridge is now lovingly preserved in a park enclave. This bridge was the scene of an important skirmish between the forces of Garibaldi and Bourbon troops on 27 May 1860, during Garibaldi's seizure of Palermo.

Palermo's massive cathedral is a hodgepodge of styles. Its predecessor was used as an Arab mosque, of which tiny fragments may be traced. The present structure was first begun in 1185 by the powerful archbishop Walter of the Mill (known accordingly by the locals as Gualtiero Offamiglio), and some of its original stonework may still be seen in the exterior decoration of the apses, with typical Norman-Sicilian interlaced arches. Its later Gothic remodeling includes the sumptuous south portico (1453), in Catalan-Aragonese style. The interior was completely transformed in the Baroque style during the eighteenth century. Crammed into a double chapel at the southwest corner are the relocated tombs of the Norman and Hohenstaufen dynasts: the massive sarcophagi contain Roger II (d. 1154); the German emperor Henry VI (d. 1197); Henry's wife (Roger II's daughter), Constance d'Hauteville (d. 1198); Henry and Constance's famous son Frederick II (d. 1250); one of Frederick's wives, Empress Constance of Aragon (d. 1222); and other family members. The treasury of the cathedral contains, among other things, objects taken from Empress Constance's tomb, including her elegant crown. In the crypt are a number of episcopal and other tombs, including that of Walter of the Mill himself.

The formidable Walter's hand may be found again, south of the city's center, in the church of Santo Spirito, built by him in 1173-1178. Though it has no important interior decoration, its exterior stonework is very handsome. As noted above, its site, which was originally on the fringe of the city, is famous for the incident that initiated the Sicilian Vespers. The church is now surrounded by one of Palermo's major cemeteries, itself a fascinating cultural spectacle.

Palestrina, the ancient Latin city of Praeneste, is located in Latium. The original colony was attributed to Telegonus, son of Ulysses; but the historic emergence of the city can be dated to the eighth century B.C. In 499 B.C. it became an ally of Rome; but its relationship with Rome was a shifting one, and not until the first century B.C. did it become firmly defined as a Roman municipality. Because of its alliance with Marius during the civil wars, the city was punished by Sulla, who for a while made it a military colony; however, it regained its full municipal status under Tiberius.

In antiquity the city became most celebrated for its sanctuary of Fortuna Primigenia, which crowned the peak of the hilltop site. The sanctuary had originated during the city's earliest era as a modest shrine but was rebuilt on a grand scale in the years following Sulla's devastation of the city. The spectacular vastness of the temple's complex as it developed in the early imperial period can still be imagined from the remains to be found on the modern site. Although Christianity arrived by the late third century, the city remained essentially pagan for many generations, and the famous shrine was used by Emperor Julian as one of his centers for a pagan revival. The final suppression of Praeneste's pagan cult by Theodosius the Great led to the abandonment of the sanctuary and its rapid decay. The much-reduced medieval city was built into the sanctuary's ruins.

During the early centuries of the medieval period Palestrina was reduced to a fortress guarding the fringes of the papal states under the immediate rule of local feudal lords, the first of whom were the counts of Tusculum. In the early twelfth century the Colonna family made it one of their particular strongholds. In 1297, with the counsel of Guido da Montefeltro, Pope Boniface VIII, during his campaign against the Colonna, besieged and devastated the city, except for the cathedral. He rebuilt the town at the foot of the hill, giving it the name Civitas Papalis, but this city was destroyed by a fire in 1300. In 1307, when the papacy was absent in Avignon, Stefano Colonna reclaimed Palestrina and made it a fortress for his struggle with Cola di Rienzo. In 1436 Cardinal Vitelleschi, legate of Pope Eugenius IV, captured and destroyed Palestrina. In 1448 the Colonna rebuilt the city, which was eventually sold, in 1630, to Carlo Barberini, the brother of Pope Urban VIII.

Pandulf I, Prince of Capua-Benevento

Pandulf I (Pandulph Ironhead, d. 981) became prince of Capua-Benevento in 961, succeeding his father, Landuif II. Pandulf came to the favorable notice of the newly crowned Roman emperor Otto I by giving asylum to Otto's pope, John XIII, when John was driven from Rome by the populace. As a result, Otto I made Pandulf marquis of Spoleto and Camerino (967) and in return Pandulf became Otto's vassal for Capua-Benevento. Pandulf was expected to have an important part in Otto's plans for attaching all of southern Italy to the northern part of the Italian kingdom, but these plans were effectively blocked by the Byzantines' resistance. However, when Gisulf I of Salerno was overthrown by a revolt in 974, Pandulf reinstated him and in return was given the succession in Salerno for himself and his son. The addition of Salerno to Pandulf's other holdings in Capua-Benevento and Spoleto-Camerino meant that for the period 974-981 Pandulf ruled Italy from

Ancona to the edge of Calabria. As much the strongest of the Italian territorial divisions, Pandulf's holdings formed an effective buffer between German and Byzantine interests. For a brief time, Pandulf's prestige was quite dazzling; he played a significant role, after Liudprand of Cremona's failure, in the diplomatic negotiations that brought about marriage between the Byzantine princess Theophano and the future Otto II.

After the death of Pandulf, his territories were split up. Spoleto reverted to northern rulers; Salerno was temporarily occupied by Amalfi; Capua and Benevento were again split apart and divided between Pandulf's sons and a nephew. The south was not to be united to the north.

Pantaleone Family

The name Pantaleo, which recurs often among the males, is applied as a surname to all the members of a large, long-lived, and successful lineage of Amalfitan merchants active from the tenth through the

fourteenth centuries. Since the name Pantaleone seems to have been common in southern Campania during the Middle Ages, scholars are wary of presuming relationships among Pantaleones whose association with the mercantile family is not explicitly stated in the sources. Although the *Life of Saint Elias of Enna* mentions a bishop Pantaleone in North Africa in 862, and although very numerous tenth-century charters record the transactions of other Pantaleones in Amalfi and its environs, the family's most reliably documented period falls in the eleventh century. During that period the dynasty produced two of the earliest cosmopolitan merchant-magnates in western history.

Maurus "the Count" (died c. 1071), who called himself consul and lord in inscriptions, was the most notable member of what he called "an illustrious house of Amalfi." Like others in his family, he made and administered a fortune trading luxury goods (and perhaps agricultural products) among Byzantium, the Islamic states, and Italy. In Constantinople, where he lived, he was the leader of the flourishing Amalfitan community. Describing himself as "black with sin" (a play on the Latin meaning of his name), he chose in old age to found and endow Christian charitable institutions in Antioch and Jerusalem (with the caliph's assent), and to make pious donations elsewhere. He became a monk at Monte Cassino in 1071, after donating Byzantine bronze doors to the abbey.

Of Maurus's six sons, Pantaleo likewise became a prominent merchant in Constantinople and the donor of bronze doors to several churches: the cathedral in Amalfi, Saint Paul's in Rome, and Saint Michael's on the Gargano. Pantaleo's career as a pan-Mediterranean diplomat representing Amalfitan and family interests suggests the wealth and connections of the Pantaleones. He sought first to free Amalfi from the yoke of the prince of Salerno (1052) and then to rid the region of the Normans. In pursuit of this latter objective he dealt with Byzantine and Holy Roman emperors, southern Italian princes, Apulian cities, and popes, coordinating unstable anti-Norman leagues. Pantaleo was a force in city affairs long after the Normans took Amalfi (1073): in 1087 he outfitted the Amalfitan contingent for the Italian expedition against Tunisia. His descendants were active in Levantine trade and, increasingly, Campanian landholding for three centuries thereafter.

The Pantaleones avoided political office but never honorary titles,

concentrating on commerce throughout their documented existence. Their passionate attachment to homeland and family, even when they resided far from Amalfi, was typical of medieval Italian traders.

Panuccio del Bagno

The poet Panuccio del Bagno (c. 1230-no later than 1276) was born to a wealthy Ghihelline merchant family of Pisa. His extant works, which survive in only two manuscripts, include a total of twenty-two poems, perhaps the beginning of a small *canzoniere*. He was the most talented of the thirteenth-century Pisan poets and was evidently quite influential among his contemporaries. His literary models were found largely in the poetry of the Provençals and the Sicilian school, and there is no doubt that he was much impressed by Guittone (as is clear in *Amor sa il meo volere miso dt sovra* and *Sovmpiagente mia gioia gioiosa*). Panuccio, like Guittone, is concerned with the emotional struggles of the individual and the power of love, but he consistently underscores the moral as well as the psychological dimensions of his own personal struggle (as in *Raprezentando a chanoscensa vostra*). In this sense he is considered by some scholars to be one of the forerunners of the *stil novo* and essential to the introspective verses of Cavalcanti. Panuccio's style is marked by frequent use of hyperbaton (a figure of speech in which the logical order of words or phrases is inverted) and internal rhyme as well as a preference for difficult, almost scholastic, syntax.

Paolo da Firenze

The composer Paolo da Firenze (Tenorista, Magister Dominus Paulus Abbas de Florentia; d. September 1419) was born sometime in the latter half of the fourteenth century and became a Camaldolese monk; he died in the order's monastery of San Viti (Arezzo). He was a member of the final generation of Italian *Trecento* composers and is a connecting figure between Francesco Landini of the earlier generation and Andrea da Firenze of his own, both of whom he seems to have known well. Paolo is supposed to have accompanied one patron, Cardinal Angelo Acciaiuoli, to Rome c. 1404; and one of his madrigals, *Godi, Firenze* (with a text from Dante's *Commedia: Inferno*, 26), was clearly composed to celebrate Florence's conquest of Pisa in 1406.

Paolo was not only an active and admired composer but a learned and distinguished music theorist. Though the issue is hotly contested, some scholars have argued that he played a crucial role in assembling the famous Squarcialupi Codex. If so, it is ironic that, although his supposed portrait appears in the codex, the place reserved for his own musical works was left as seventeen blank folios; his surviving works are preserved in other Tuscan manuscripts.

These works comprise, beyond two scant Latin liturgical pieces, a

sizable body of Italian vocal music. Attributed with relative certainty are twenty-two *ballate*, variously for two or three voices; and eleven madrigals, all for two voices. There are also two more *ballate* that survive as fragments; and thirteen other *ballate*, variously for two or three voices, which are preserved in one manuscript where the attributions of his name have been erased, leaving us uncertain as to their authenticity.

On the one hand, Paolo impresses for his conservatism. He is unusual in clinging to the madrigal, an older form bypassed by most musicians of his generation. In both of his vocal forms, Paolo generally seems to continue the traditions of his older colleague, Landini. On the other hand, Paolo's writing clearly shows an assimilation not only of more progressive Italian styles but also of some influence from French styles of the late *ars nova*. Though his vocal lines are simple and clearly Italianate in tradition, he attempts to go beyond earlier flexibility and construct compositions with an overall logic of motivic development. His two liturgical works also show him combining Italianate vocal lines with *cantus firmus* material after the French polyphonic manner. He seems to have known something of Johannes Ciconia and Ciconia's work. Paolo belongs to a trend that envisioned a fusion of French and Italian elements at the dawn of the *Quattrocento*.

Paolo da Perugia

Paolo da Perugia (d. 1348), a man of letters, was born in Perugia (as his name indicates), came to Naples as an adult, and spent the rest of his life there. By 1324 he had been admitted to the Angevin court, where he

was employed by King Robert as a *secretaries* and notary in the chancery, and as a lay cleric for the royal chapel. Whatever his official titles, it appears that he was also in charge of the richly endowed royal library in the Castel Nuovo ("new castle"). Evidence suggests that he was married, had many children, and died in poverty (of the plague) while working on a commentary on Justinian's codification of Roman law.

Paolo's most important work was a compendium of ancient myths, *Collectiones*, which does not survive. An abbreviated version of this collection suggests that its basic organizing principle was genealogical, and this may have influenced his young acquaintance at Robert's court, Giovanni Boccaccio, in the design for his own work on mythology, *Genealogie deorum gentilium* (*Genealogies of the Pagan Gods*). The short outline version of Paolo's *Collectiones* is preserved in manuscript Magliabechiano 122, Florence, Biblioteca Nazionale Centrale (Hortis 1879), perhaps thanks to Boccaccio, who drew on it for his work. Indeed, in *Genealogie* (15.6) Boccaccio speaks of Paolo's wonderful intellectual talents and laments his lost masterpiece, relating the story of how Paolo's less than generous widow, Biella, destroyed not only this major book but many others.

Two of Paolo's works have survived intact: one commentary on Horace's *An poetica* and another on Persius's *Satires*. In the latter work Paolo presents the life of Persius, discusses the genre of satire in general, and then undertakes a systematic and detailed analysis of the text. It is possible to discern certain prehumanistic attitudes and characteristics that were present in the Angevin court in Naples—in particular, the consideration of classical texts on their own merits, largely independent of any reconciliation with Christian doctrine, and a more refined critical and historical sensitivity toward classical material. It was the wide range of important texts (in both Greek and Latin) readily available in the royal library that made these investigations possible. The Neapolitan court was also frequented by the Calabrian monk Barlaam, who no doubt had a decisive impact on Paolo's knowledge of Greek mythological sources and compilations. Moreover, Barlaam met Boccaccio in Naples and later met Petrarch at the papal court in Avignon, and both authors began their study of Greek with Barlaam.

Papacy

The title pope (Latin *papa*, "father") for the bishop of Rome is found occasionally from the mid-fourth century on. Beginning in the mid-fifth century, it became familiar in the west, having spread there from the east, where it was customarily used for abbots, bishops, and patriarchs. In Roman Catholic doctrine the preeminence or primacy of the pope over the church on earth rests on a particular understanding of several passages in the New Testament. The popes are the direct, legal (Leo I) successors of the apostle Peter, who had obtained primacy among the apostles from Christ himself. The most famous of the Petrine passages is "You are Peter and on this rock (*petram*) I shall build my church, and the gates of hell shall not prevail against her. And I shall give you the

keys of the kingdom of heaven. And whatever you shall bind upon earth will also be bound in heaven, and whatever you shall loose on earth will also be loosed in heaven" (Matthew 16:18-19). However, even this passage was not free of ambiguity, especially in contrast with other New Testament passages that indicate equality among the apostles, or variations in the understanding of the term "rock." For the historical development of the papacy and thus of papal primacy (implied in the western understanding), therefore, tradition precedes doctrine in importance.

At least since the end of the first century, the Christian community in Rome assumed as common knowledge that both Peter and Paul lived and were martyred there. Although the oldest extant lists of Roman bishops from the late second century did not include the name of Peter as first bishop of the city, he was commemorated from about this period at the site of the Vatican. Recent excavations under the Confessio in Saint Peter's basilica seem to indicate that one tomb was especially venerated since the mid-second century. It served as focus for other tombs that surrounded it. The preeminence of the bishop of Rome both as claimed by the papacy and as recognized by the church at large developed ever more rapidly from then on, but by no means in a straight line. Irenaeus, c. 180, takes the church of Rome as an authoritative touchstone of Christian tradition. Pope Calixtus I (r. 217–222) based his legalization of marriages between noblewomen and Christian slaves on the authority of the *cathedra* (teaching chair) of the Roman church which he occupied, thus adumbrating the theory of apostolic succession. Canon 6 from the Council of Nicaea (325) could still speak of Rome as just one of the patriarchal sees, but by the time of Pope Damasus I (r. 366-384) the African bishop Optatus of Mileve in his writings against the Donatists recognized the special dignity of Rome, and Emperor Gratian supported the papal claim to authority over the bishops of Latin Christendom.

Largely because Emperor Constantine I had moved the capital to Constantinople, the patriarch of Constantinople soon asserted rival claims (Council of Constantinople, 381; Council of Chalcedon, 451). The popes, however, began to fill the vacuum that the decline of imperial authority had left in the west. Particularly significant were the reigns of popes Leo I (440-461) and Gelasius I (492-496). Leo, supported by

Emperor Valentinian III, assumed authority over the church of Gaul; took the title *pontifex maximus*, which the emperors had abandoned; and claimed unique authority as heir of the apostle Peter. In 494, Gelasius I wrote a famous letter to Emperor Anastasius describing the division of authority in this world—"There are two things, august emperor, by which this world is chiefly ruled: the sacred authority of bishops and the royal power"—asserting that in matters spiritual (e.g., Christological definitions) kings were subject to the bishops, just as bishops owed obedience to the emperors in temporal affairs. This letter received differing interpretations, last but not least by Pope Gregory VII (r. 1073-1085), who used excerpts from it to document the inferiority of the monarchy to the priesthood. However, Gelasius appears to have asserted merely ecclesiastical independence, outlining the dual theory of authority, so characteristic of the west until the eleventh-century reform. The legislation of Emperor Justinian, the novels (new supplementary constitutions) of his collection later known as *Corpus iuris civilis* (529), includes as novel 6 a text emphasizing the responsibilities of the priesthood for eternal salvation and of the emperors for civil peace, principles clearly recalling Gelasius's statement. However, in contrast to the papacy, the statement implied for Justinian a supreme imperial obligation to preserve the Christian faith and ecclesiastical discipline. Novel 131, for example, decreed the equal rank of the first four ecumenical councils with the four gospels; novel 132 placed the responsibility for the elimination of heresies and heretics squarely on the imperial government. The imperial responsibility for the well-being of the church and the civil duties of the clergy, especially important in the west, meant that nominations to bishoprics were of vital interest to and consequently influenced by the emperors. This applied especially to Rome and to Constantinople.

The barbarian invasions and the establishment of barbarian kingdoms in the western Roman empire diminished Byzantine influence in Italian affairs, although Constantinople continued to control the papacy as far as possible. The late seventh century and the first half of the eighth century are known as the age of the Greek popes. This does not mean, however, that the Latin or Italian popes of the period were less dependent on Constantinople than popes of eastern origin (like Syrians or Palestinians) were. Greek influence predominated

in shaping the papacy of the period as well as the city of Rome. Examples are the liturgy and the organization of the landed property of the church. By the sixth century, the papacy had become at least nominally the largest landowner in Italy. Pope Gregory I the Great (r. 590-604), sometimes described as the first of the medieval popes, is an outstanding example of the role of the papacy; his writings deeply influenced medieval Europe, and, apart from Augustine of Hippo, he is the only Latin church father. Gregory was a descendant of the Roman senatorial aristocracy, and he followed the *cursus honorum* of a Roman administrator, becoming prefect of the city and serving as papal envoy to Constantinople. He withdrew to lead a monastic life on his estates but was elected to the papacy in 590. From then until his death in 604, he once again served Rome, combining in effect both secular and spiritual leadership. Because the Byzantines were unable to defend Italy or Rome against the Lombards, Gregory himself negotiated with the invaders, tried to maintain the defenses of the city, and reorganized the administration of the vast estates of the church so as to provide foodstuffs for the starving population as well as for the church. His decision in 594 to send a group of monastic missionaries under Augustine to Anglo-Saxon England was very influential in establishing close links between England and Rome, or rather between England and Saint Peter. The special reverence for Peter among Englishmen is illustrated as early as the Venerable Bede's *Ecclesiastical History* (735) and again by Anglo-Saxon missionaries such as Willibrord and in particular Boniface (martyred 754 in Frisia), who had obtained the backing of the papacy for his missions among the eastern Franks, I huringians, and Frisians. The personal and individualized holiness of the Scottish (i.e., Irish-Celtic) missionaries of an earlier period was now overlaid by Roman patterns of episcopal and monastic organization. The influence of Gregory I, therefore, can hardly be exaggerated. Gregory is also responsible for coining the title "servant of the servants of God," which to this day conveys a strong spiritual message: "Its sublime humility made a striking contrast with the proud title of 'ecumenical patriarch' which the bishops of New Rome had adopted" (Kuttner 1981). Gregory was horrified by the use of the terms "ecumenical," "imperial," and "universal," because he looked to a universal church whose only head was Christ, and he emphasized that

no pope had ever taken the headship. Gregory had found a balance between personal humility and the great dignity of his office that was not to last into the high Middle Ages or even into the seventh century, when several popes accepted the title "universal" bestowed on them by the councils or in letters of the emperors. During the eleventh-century reform, Pope Leo IX (r. 1049-1054) would still preserve the heritage of Gregory I, rejecting the title "universal patriarch" for himself and reprimanding the patriarch of Constantinople for using it. Not much later, though, Pope Gregory VII would formulate in his *Dictatus papae* the proposition "The Roman pontiff alone is by right called universal." Whatever the nature of this document in the official register may have been, it does express the thought as well as the practice of the seventh Gregory and heralds the papal monarchy.

The centuries separating Gregory I and Gregory VII brought important changes to the papacy. The consequences of these changes were the problems characteristic of the medieval papacy: its dependence on the Roman nobility, its relationship with Frankish or German rulers, and the creation and defense of the papal states. Increased tension between Constantinople and Rome led gradually to Rome's separation from the Byzantine empire. In the eighth century, two crucial issues divided them: taxation and the cult of images. In 717-718, Emperor Leo III had successfully defeated the Muslims' attack on Constantinople. His reorganization of army and administration in order to reconquer Asia Minor required an increase in taxes, which were to be levied also from ecclesiastical property, including the papal lands in Italy. Pope Gregory II (r. 715-731) refused to go along, and imperial agents sent to arrest him failed in face of resistance in Rome and throughout Byzantine Italy. The question of the veneration of images, finally prohibited by Leo's son Constantine V at the council of Heracleia of 754, caused additional uprisings. The papacy objected to Iconoclasm and as one result lost its jurisdiction over the Byzantine vicariates of Saloniki as well as Sicily and southern Italy. Leo III transferred the areas to the patriarch of Constantinople, in effect largely restricting landownership by the papacy and restricting its corresponding influence to central and northern Italy. Somewhat ironically, this was to lead to a pronounced intensification of the influence of the papacy on Italy, and in fact to the creation of the

"republic of Saint Peter," for a time still nominally under the sovereignty of the emperor but practically controlled by the pope and the Roman nobility. It was, therefore, also the papacy that had to confront the continued expansion of the Lombards in Italy at the expense of Rome. The Lombard king Aistulf had conquered the remnant of the Byzantine exarchate of Ravenna, forced independent Lombard dukes in southern Italy to submit to his rule, and then threatened the city of Rome. Negotiations between Pope Stephen II (r. 752-757) and Aistulf failed. Stephen was the first pope to travel to the Frankish empire in search of aid; in 754, at Ponthion, he concluded a treaty with King Pepin, who promised Saint Peter and his vicar parts of Italy that supplemented the patrimony of Saint Peter and became the foundation of what was called later the Papal States. When Aistulf nevertheless continued his conquests in 756, the Franks undertook a successful military campaign, forcing Aistulf to deliver part of the exarchate with Ravenna into the hands of the representative of Saint Peter, the pope. Pepin's emissary, Abbot Fulrad of Saint-Denis, deposited the keys of the respective cities at the tomb of Saint Peter. Charlemagne (r. 768-814) was forced to undertake another campaign against the Lombards. On its successful completion in 774, he expanded his father's promise in Rome. Both Pepin and Charles I were given the patrician dignity of Rome, *patricius Romanorum*. The title was used by the papacy to justify the Franks' interventions in Italy, although King Pepin referred exclusively to his promise to Saint Peter. The veneration of Saint Peter, however, did not prevent Pepin, Charlemagne, or their later successors—including the Ottonian and Salian rulers of Germany—from maintaining a certain degree of sovereignty over the territories that they had granted to Saint Peter and conquered for him. The coronation of Charlemagne as emperor by Pope Leo III (r. 795-816) tended to reinforce such tendencies, although the papacy very likely saw the coronation of the emperors at their hand in Rome as a means of controlling the western emperor. Some claims made by the papacy are embodied in the Donation of Constantine, a forgery probably dating from the second half of the eighth century and originating presumably in papal circles. The Donation is based on the legend of Sylvester I and his purported baptism of Emperor Constantine I, who in gratitude conveyed the imperial sovereignty and all imperial properties in the western Roman

empire to the papacy. It is unknown whether the document was actually familiar to the popes, let alone used by them before the tenth century; the forgery exerted its chief influence from the Gregorian reform on. Nevertheless, it is a significant indication of perceptions in Rome.

The decline of Carolingian power provided greater independence for the papacy, but at the same time the popes found themselves defenseless in the face of Saracen and Norman invasions. Even Pope Nicholas I (r. 858-867) could not realize the claims to superiority over the western and eastern emperors or assert his authority over some of the powerful archbishops whose policies he opposed. It is in the reign of Nicholas that the first traces of the *Pseudo-Isidorian Decretals* can be detected. This canonical collection—possibly compiled in the archdiocese of Reims as a mosaic of authentic, forged, and falsified texts, chiefly papal letters—whittled away the power of the archbishops in favor of the bishops who could appeal directly to Rome. After Nicholas, the prestige of the papacy quickly reached a low point. For much of the later ninth century, the tenth century, and the early eleventh century, the papacy was in the hands of various factions of the Roman nobility. In 1012, the predominant Crescentians gave way to the Tusculans. Despite the renewal of the imperial power with the coronation of Otto I (r. 936-973) in February 962 by Pope John XII (r. 955-963), it was not until the intervention of Henry III at the synods of Sutri and Rome in 1046 that the papacy could once again pursue a policy independent of the local interests of the Roman nobility. As Roman patrician, Emperor Henry III also determined the following papal elections up to the pontificate of Victor II (1055-1057).

The most prominent among the "German" reform popes is Leo IX (r. 1049-1054). With his pontificate, the papacy took over the leadership of the eleventh-century church reform. Until that time, this reform had been chiefly represented by reformed monasteries (Cluny, Gorze, Pomposa) and individual bishops, princes, and emperors. With the support of Henry III and of his collaborators—with the important exception of Hildebrand (later Pope Gregory VII) and Peter Damian, they were all from north of the Alps—Leo transformed the papacy once again into an international institution with a universal claim to leadership. He did this personally through his many councils and

travels as well as through legates and initial steps toward the creation of the college of cardinals. Until then, the suburbicarian (a term designating the dioceses around Rome) cardinal bishops and the Roman cardinal priests and cardinal deacons had largely liturgical functions. Beginning with Leo IX, they became the foremost political advisers to the popes. The Lateran synod held by Pope Nicholas II in 1059 passed, in addition to reform legislation, a decree to regulate future papal elections. The elections were in the first instance entrusted to the cardinal bishops, but by the early twelfth century this influential right was shared by all ranks of cardinals, although the clergy and people of Rome were still excluded. The alliance with the Italian Normans under Pope Nicholas II (Leo IX had pursued the earlier anti-Norman policy of the papacy) and fiscal reforms at the incipient *curia* further enabled the popes to push their demands for reforms. When Hildebrand was elected to the papacy as Gregory VII in 1073, the demands for moral reforms among the clergy and laity, expressed through legislation against simony and a married clergy (nicolaitism), were overshadowed by a more radical demand for the "liberty" of the church. This call for ecclesiastical freedom could be found earlier, in the writings of Cardinal Humbert of Silva Candida (d. 1062), but it did not become official papal policy until Gregory's pontificate. Gregory's general prohibition of investiture of future bishops and abbots with ring and staff by King Henry IV (c. 1075) initiated a struggle between church and monarchy for the right order in the world that would not end until the agreements of Worms in 1122-1123. The deposition and excommunication of Henry by the pope seriously weakened the German monarchy. Henry's submission at Canossa was a recognition of the papacy's insistence on obedience from all Christians, including the kings of Europe. In the course of the twelfth century, the theory of the two swords was elaborated, and papal claims that the popes held both the spiritual and the temporal sword (i.e., secular government) were affirmed. The temporal sword was to be held at the behest of the papacy for the defense of the church. The papal monarchy as it evolved in the twelfth and thirteenth century would be unthinkable without Gregory VII, a religious genius inspired by his conviction of the exalted rank of the pope as representative and embodiment of Saint Peter.

These ideas on the part of the papacy necessarily influenced the

internal organization of the church as well and are responsible for a pronounced and successful move toward hierarchical organization and toward, for example, the adoption throughout the Latin church of Roman liturgical practices. The new rank of the papacy is evident also in papal leadership in the crusade movement, particularly under Pope Urban II (r. 1088-1099), who could, however, look to earlier precedents. For centuries, the papacy in particular was under the influence of the crusading ideal, eventually transposing the ideal of the liberation of Jerusalem—a concept not to be found in Urban's call for the first crusade at the Council of Clermont in 1095—to a defense against Turkish attacks. The politically more prominent role of the papacy in the High Middle Ages, supported by the new scientific jurisprudence associated with the growing universities and influenced by developments in Roman law, was not without its dangers, however. In his treatise *On Consideration*, Bernard of Clairvaux called on Pope Eugene III (r. 1145 -1153), a Cistercian monk, to retain his monastic focus on contemplation, and not to allow secular and especially judicial concerns to dominate his lifestyle or reign.

The pontificate of Innocent III (1198-1216) saw the papacy at the zenith of its influence. Indicative of his standing is his intervention both in England and in the Holy Roman Empire. Innocent had studied theology at Paris until 1187 and had continued his studies at Bologna, the citadel of jurisprudence. Therefore, it has long been assumed that at Bologna, Innocent was a student of Huguccio of Pisa (Uguccione da Pisa), one of the most important canon lawyers of the late twelfth century, and that the great skill which Innocent was to show in deciding cases brought before him was due to this legal training. More recently, this assumption has become doubtful; the legal learning displayed so brilliantly in Innocent's decretals may in part reflect the studies of officials of the curia. It can still be said, however, that Innocent III perfectly adapted current canonistic teaching to his needs. He was the first pope to ask a canonist, Peter of Benevento, to compile texts published by Innocent himself into a decretal collection, *Collectio tertia*, which was officially published in 1210, an excellent means to make papal law the effective law recognized at schools of law and universities, as well as in the courts. In 1226, Honorius III followed in Innocent's footsteps with the publication of *Compilatio quinta*. Both

collections—like other, unofficial private compilations of papal decretal letters—were supplanted by the *Liber extra (vagantium)* of Pope Gregory IX in 1234.

With the defeat of the last Hohenstaufen heirs of Frederick II and the installation of the house of Anjou in the kingdom of Naples and Sicily by 1268, the papacy had secured political success. But the beginning growth of European nationalism was accompanied by increasing criticism of the condition of the church and disapproval of the use of spiritual means—such as excommunication and marriage—for secular, political ends. The election of the hermit Peter of Morrone to the papacy as Celestine V (the "angel pope") in 1294 was partly a response to a longing for a more spiritual church. But Celestine resigned almost immediately and was succeeded by Boniface VIII (r. 1294-1303), who was one of the most imperial figures in the history of the papacy and is the first pope to be represented wearing the papal tiara. Boniface, though, was unable to enforce his claims as expressed in the bull *Unam sanctam*. Philip the Fair of France emerged as victor in the struggle. The pontificate of Boniface illustrates the power of the French monarchy during the later Middle Ages. The years 1309-1377 were the period of the "Babylonian captivity," when the papacy resided at Avignon, an independent territory until it was acquired by the papacy in 1348, but nonetheless under strong French influence; France began just beyond the Pont d Avignon. With rising fiscal needs—last but not least caused by the attempt to keep control over the papal states from a distance and the obligation to maintain the numerous cardinals (all of whom by now had their own court and clientele)—the curia developed new financial instruments such as papal provisions, the older annates, and the *servitium commune* (general support fee, amounting to one-third of the first year's income from an office or benefice). The various fees were paid by successful candidates for both bishoprics and abbeys, or clergy-granted benefices. But not only army, cardinalate, and curia had to be maintained. Beginning with Benedict XII (r. 1334-1342), the popes enlarged the former episcopal residence of Avignon into an impressive papal palace, which is still imposing today despite being damaged in the French Revolution.

Increasing fiscal control over the church, however, was accompanied by a growing loss of religious and political influence in the evolving

nation-states of Europe. Pluralism and nepotism were rampant in the church. Fiscal exactions became oppressive. The Great Schism of 1378, with rival popes at Avignon and Rome, created yet another emergency, since it was impossible to decide the question of legitimacy. Conciliarist theories, anchored in the older canon law, provided a way out by suggesting that the general council—as representative of the universal church—stood above the pope, and under specific circumstances could judge and depose a pope as well as initiate the reform of the church in head and members. The councils of Pisa (1409) and Constance (1414-1418) acted accordingly, ending the schism through the election of Martin V (r. 1417–1431). With Nicholas V (r. 1447-1455), who obtained the abdication of the last medieval antipope (Felix V), the papacy began its close connection with the great humanists and artists of the Renaissance—a connection that was to bring the papacy new luster and determine to this day the image of Rome. But neither patronage of the arts nor the reforms that were beginning to change the church and the papacy could prevent the Protestant Reformation. It was to reduce papal influence in northern Europe to a considerable extent.

Papal States

The term "papal states" normally describes a multifarious collection of economic, juridical, and political rights that the popes held and attempted to enforce in central Italy during much of the Middle Ages. The plural form, peculiar to the English language, reflects the diversity of the states' component parts; it also helps to surmount unease over the

application of the idea of a "state" to a medieval government, especially one whose authority in the field was negligible and often disregarded by its supposed subjects. Originally, the territories in Etruria, the Sabine hills, the Roman Campagna, and the Pontine plain up to the Liri River and Terracina which the popes began ruling in the eighth century were called the lands of Saint Peter; after the twelfth century the name Patrimony of Saint Peter became standard. Scholars consider the major overhaul of papal administration under Innocent III (r. 1198-1216) sufficient justification for the "promotion" of these territories to the rank of statehood, so that "papal states" is the universally accepted term for the area subordinate to papal temporal rule only after the thirteenth century. Yet throughout the medieval period, even after Innocent III's reorganization, the papacy proved incapable of controlling its central Italian domains regardless of what they were called. Indeed, a major theme in the long and diverse history of the medieval papal states is the relentless struggle between the forces of papal centralization and the recalcitrance of many regions unwilling to forgo their autonomy. Only after the Great Schism in the fifteenth century, with Italy clear of the Holy Roman emperor's rival claim for sovereignty, did the popes subdue local centrifugal forces (*comuni*, feudal lords) and solidly establish the papal states, so that they weathered several shocks during the Renaissance (1494, 1527) and lasted until the *bersaglieri* stormed Rome in 1870.

The roots of the papal states lie in the landed property (with attendant administrative responsibilities) the popes accumulated long before they established a sovereign state during the eighth century, and in the pastoral duties of the Roman bishops. Like all episcopal sees, the church of Rome benefited from the generosity of the faithful in the waning years of the Roman empire. By the mid-fifth century, the pope himself, rather than the various churches in Rome, held landed property inferior in quantity only to that of the richest Roman aristocrats. The process of accumulation of landed wealth which made the popes politically important in Italy received a significant boost from the Gothic wars (535-555) and their Byzantine aftermath. Much land was bequeathed to the Holy See, which may also have benefited from the confiscations of Arian estates after 555. Although the Lombards' invasion of Italy (568) deprived Rome of access to many patrimonies (as

the regional subdivisions of papal estates were called) in northern Italy, by the early seventh century the popes owned land enough in Sicily, Campania, and the environs of Rome itself to put them among the peninsula's greatest landlords.

Administration of the patrimonies occupied the popes from an early date. In 481, a synod forbade their alienation and, in deference to canon law, required that revenue accruing from these sources should be destined for the maintenance of the pope and the Roman clergy, church restoration, and charity. This fourfold division of income persisted in the papal history of the early Middle Ages. The famous letters of Pope Gregory I (r. 590-604) provide the earliest substantial description of the patrimonies and their management. Through a system of papally appointed regional supervisors with moral and judicial responsibility (rectors) over scattered farms (*condumae*) and by short term leases designed to forestall hereditability, Gregory cultivated the patrimonies and developed a trained bureaucracy. This land and the administration it generated ultimately kept Rome's buildings repaired and its citizens fed and heated, because as civil administration decayed, bishops had increasingly become their communities' leaders and providers. The popes' pastoral responsibility for the welfare of their diocesan flock thus was an important factor in the creation of a sovereign papal state.

The hostile rule of the Lombards in Italy bottled the Holy See into a situation of political and military dependence on the Byzantine empire throughout the seventh century. During this "Byzantine captivity," the popes acted more or less as loyal subjects of Constantinople, to whose officials in Ravenna they deferred even after the Lombard monarchs became orthodox Christians. Occasional doctrinal differences between Rome and Byzantium could lead to acrimonious disputes with the emperor and his Italian representatives, and even to violence. But the popes did not conceive of a new order deprived of Byzantine authority in the duchy of Rome (the Byzantine province in which they lived), nor did they seek to establish an independent state. Rather, they sought a stronger, more effective Byzantine administration and military presence in central Italy, able to repulse Lombard kings and dukes. Yet they sought this protection just when the Byzantine empire, whose resources were committed along the eastern frontier, was least able to provide it. As the seventh-century popes shouldered ever greater administrative

burdens in their diocese, took over Rome's welfare programs, repaired its aqueducts (after 625), and restored the city walls (after 708), the Byzantines came to terms with the Lombards and recognized their usurpations in a treaty (c. 680) that presumably left the Holy See disillusioned with Byzantium.

After the 680s, theological disputes, at the root of most estrangements of the papacy from Byzantium, proved too thorny to settle. In 692, when Emperor Justinian II attempted to punish Pope Sergius I for rejecting the canons of the imperially sponsored council "in Trullo" (or "Quinisext," a reference to the Trullan Synod), as his predecessors had punished the hapless antimonothelite Pope Martin in 653, he discovered that the central Italian population, even the people of Ravenna, were ready and able to spring to the defense of the pope. Justinian II had to desist. Soon relations between the papacy and the empire returned to placid normality, but the incident showed that the popes commanded the loyalty of the flock for which they provided, and that the inhabitants of Byzantine Italy no longer identified their interests with those of Byzantium.

After barely surviving the great Arab siege of Constantinople (717-738), the Byzantine emperor Leo III ("the Isaurian") resolved to reform Byzantine civil and military administration. His novel taxes, and his removal of icons from churches and public places (where he thought they had offended God and allowed Islam to triumph), were policies applicable to Byzantine Italy, the westernmost limb of the empire. Iconoclasm was pointless and heretical to most Italians, but the new tastes were at least as repugnant. These novelties came in the 720s, just as the Lombard king Liutprand launched a campaign to establish his lordship over all of the Italian peninsula, including the duchy of Rome. His success was considerable in the region of Ravenna, and he subdued the traditionally independent Lombard dukes in central Italy. In doing so, Liutprand became a direct menace to Rome. In 729, the king "donated" Sutri, a strategic papal patrimony in Etruria that he had occupied, to the popes, but this gesture failed to end the papacy's fears. In 732-733, Leo III, angered by the Romans' tax evasion and iconophilia, had removed Sicily, Calabria, and Illyricum from Rome's ecclesiastical jurisdiction and confiscated the patrimonies there, thus making the estates closest to Rome in central Italy the papacy's staff of life (into the

late Middle Ages, popes considered these the "garden of delights of the church"). The Lombards' sieges of Rome (739, 741) pinched the popes further and exposed the utter inadequacy of Rome's defenses and the Byzantines' protection. Pope Gregory III, in desperation, even asked the faraway Franks for help (739), but he was rebuffed.

Against this backdrop of the Lombards' intensified military pressure and the Byzantine's diminished reliability regarding doctrine and military aid, the popes—weighted down with considerable moral and administrative responsibility in central Italy—made their first moves as independent agents on the Italian stage. The founding fathers of the papal states were Gregory II (d. 731), who staved off a Lombard occupation by tireless diplomacy; and Zachary I (d. 752), who opened friendly relations with Francia, while reorganizing papal farms as *domus cultae* to facilitate Rome's supplies. No longer acting only as estate managers, Byzantine ambassadors, or solicitous pastors, these popes considered the former duchy of Rome a sovereign state over whose interests they presided. The government of the new state fell to the Lateran bureaucracy, which had long been administering finances and justice in the patrimonies.

Zachary resolved to come to terms with Liutprand, and in negotiations at Terni (742) he obtained the return of frontier posts on the duchy's northern rim (Amelia, Orte, Bomarzo, and Blera, plus Cesena) to the popes. The pope was an acknowledged head of state; his prestige was such that Liutprand acquiesced to Zachary's demand that recently annexed Ravennan territory be returned to Ravenna. A grateful Byzantine emperor donated lands at Ninfa and Norma (south of Rome) to the pope for his intervention, expanding the territorial base of the Holy See. Yet the situation was far from tranquil: the Lombards were notoriously fickle, and papal sources present them as downright treacherous. Thus, when a coy query reached Rome from the Frankish court about the appropriateness of deposing worthless kings (749), Pope Zachary seized the chance to form an alliance with the potentate who had asked, and to sanction his putsch. The potentate, Pepin III, was duly crowned king of the Franks. When the pope, now Stephen II, came to Francia (753) expressly to seek military aid, Pepin espoused the cause of the Roman church against renewed Lombard incursions. In 755 and 756, he campaigned victoriously in Italy. Before his last return to Francia,

Pepin made a lavish "donation" of twenty-two cities and territories in Byzantine Italy to "Saint Peter." Frankish envoys deposited the keys to these cities on Saint Peter's tomb in Rome. The "Donation of Pepin" is often considered the constitutive act of the papal states and of the temporal power of the papacy.

Actual control of the territories did not, however, follow from the diplomatic settlement. The Lombard king, Desiderius, was a skilled and dangerous antagonist of the papacy who manipulated a strong faction in Rome and prevented the popes from effectively ruling their state. By most estimates, it was in this context that the forgery called the Donation of Constantine was produced in papal circles (c. 760). The Donation, which presumably accorded the papacy sovereignty over the entire western Roman empire, is seldom mentioned in papal documents until the thirteenth century and may be a sign of the unease felt in the Lateran after the alliance between the popes and the Franks had failed to end Lombards' harassment of the papal state. The Donation certainly reflects the ideological underpinnings that men in the Lateran saw for papal Italy's emancipation from Byzantium. Desiderius, like everyone else before the mid-ninth century, ignored it. Taking advantage of the disorderly political situation north of the Alps, and in Rome itself after 767, he occupied many papal areas and, when he thought it safe, even marched on Rome. The embattled Pope Hadrian I asked Charlemagne to rush to the rescue (773). Before capturing the Lombard capital, Pavia, the Frankish king spent Easter 774 in Rome. There, according to official papal records, he promised to hand over (*promissio donationis*) to Saint Peter all of Italy south of an imagined line running between Luni, on the Ligurian coast, and Monselice, near Venice, along with Istria and Venetia. The latter regions never formed part of the papal states and seldom were included in the papacy's claims. Otherwise, the *promissio donationis* became the ambition all popes tried, vainly, to realize. Charlemagne himself, much to Hadrian's chagrin, never lived up to his promise, because he considered it to have been superseded by events later in the year; he did, however, ensure that his father Pepin's concessions to the papacy were honored. During Hadrian's pontificate most of Byzantine central Italy, from Ravenna across the Apennines via Perugia to Rome, together with Lombard Tuscany and some towns south of Rome, entered the papal states.

Relations between the papacy and the Franks were cordial even while Hadrian protested to his good friend Charlemagne against what he initially regarded as the halfhearted fulfillment of the king's promise. In the course of the 780s, the pope and the king worked out an understanding. The borders of the papal states were firmly and, from a Carolingian standpoint, generously defined, although Spoleto and Benevento fell outside these boundaries. The papal states enjoyed the Franks' protection and were part of the Frankish commonwealth according to the often-renewed terms of special treaties between the kings and popes (the earliest surviving treaty, the "Ludovicianum" of 817, is thought to mirror earlier ones). These treaties carefully guarded the sovereignty of the papal states; even the riots of 799, which left Pope Leo III (d. 816) maimed and brought Charlemagne to Rome to investigate, did not alter this "constitutional" arrangement. Charlemagne left the city as emperor, but he continued to respect the independence of the popes' enclave.

The independence and stability of the papal states were undermined by intense competition for status, wealth, and power among Rome's ruling classes. This competition, which first emerged in 767, when Duke Toto attempted a coup in Rome, could degenerate into brawls like that of 799. It focused on control of the papal office, the states, and the lands of the Roman church. Initially the threat of the Franks' might kept the competition within bounds and kept the papal states from anarchy. In 815, for instance, Louis the Pious delegated to King Bernard the duty of repressing a nasty Roman revolt and reestablishing Pope Leo's authority. But with the decline of the Franks' power in the 800s, the Roman aristocracy had more leeway. In a treaty of 824 between the papacy and the Franks, the aristocracy obtained considerable control over papal elections; simultaneously, direct intervention by the Franks in papal government was sanctioned. This meant that, as Frankish authority in Italy collapsed after the death of Louis II in 875, the local aristocracies would exercise power in Rome and in outlying regions of the papal states, although forays by Carolingian rulers or other Italian potentates also affected the evolution of affairs, as did repeated raids by the Muslims before 915 (the papacy's defense against the "Saracens" proved ineffective; only locally organized efforts worked). Thus, as of the later ninth century, papal government in central Italy was

increasingly challenged by local forces. Regional elites grasped for autonomy and originated the dichotomy between the theory, or grand claims, and practice, or weakness, of papal temporal power which persisted to the end of the Middle Ages.

The regional aristocracies sought and obtained grants of land and jurisdiction from the popes. As papal counts and vicars, local potentates pursued their own ends. Valiant efforts by popes such as John VIII (d. 882) could not stem the tide of gifts, usurpations, and titles that dismembered the papal states. In Rome, the descendants of the nobleman Theophylact manipulated the Holy See, procuring major concessions for themselves that included a feudal grant of the strategic county of Terracina. In 1001, Emperor Otto III (d. 1003) complained that irresponsible alienations by weak, nepotistic popes had reduced the papal states to nothing and had left the see impoverished. Even the ring of papal model farms (*dornus cultae*) around Rome had devolved into private hands. Otto III and other German emperors endeavored to correct this situation with ulterior grants (the most important was that of Otto I to John XII in 962), confirmations of previous grants, advantageous treaties (most importantly that of Henry II for Benedict VII in 1020), and armed intervention against the more restive Roman magnates. The emperors did this to tighten their own hold on the Holy See, but their efforts were too episodic to be successful. Without central direction the papal states sprang apart, while local forces took over military and administrative responsibilities, a process prevalent throughout the Italian peninsula before the eleventh century. Only the dynasty from Frascati (Tusculani), which controlled the Roman see between 1012 and 1046, made slight advances in reasserting papal control over formerly held territories.

The eleventh-century reform movement was aimed at setting up a morally righteous, politically and economically independent papacy as a means of improving Christendom. The reformers strove to liberate the papacy and its territories from the influence of the emperors and the control of the central Italian magnates. Before the debacle of 1084, some notable successes were achieved against the region's centrifugal tides. Benevento entered the papal states (1050, confirmed 1052), the hold of powerful families on church land in the Sabine hills and south of Rome was loosened, and a valuable alliance was forged with the rising

Norman rulers of southern Italy. In 1059, Pope Leo IX invested the Normans with tenure of the territories they conquered. This implied that the papacy held a title over those southern regions, which was translated into a series of levies and privileges called the regalia of Saint Peter. Although the Holy See had to tolerate the Normans' raids across its southern borders, and allowed the Norman conquest of the Abruzzi (which was, in any case, cut off from the papal states by the Simbruini mountains and hence was too difficult to manage from Rome), it obtained a strong ally against the empire and the old Roman families. The Holy See appeared to be well placed to turn over a new leaf and end the embarrassing independence of so many of its temporal subjects. But in the end, the reformed popes were scarcely better able than their predecessors to subject the states to their rule. Often they contented themselves with renewing their legal title to a given area and then ceding its tenure to the old local masters. When Countess Matilda left her vast holdings in northern Italy to the popes (1115), the situation did not improve, because the emperors disputed the papacy's claims and hampered the papacy's management of the Matildine lands until 1133. The Matildine inheritance did, however, extend papal claims into the Po valley.

The German emperors were the formal antagonists of the papal states in the High Middle Ages. They resisted the papacy's pretensions to rule portions of central Italy (Emilia, Ravenna, and the Pentapolis) and expected to enforce their feudal rights within the papal states, whose protectors they proclaimed themselves to be on several occasions in the 1100s. Frederick I Barba rossa, despite his momentous defeat at Legnano (1176), managed to elude recognition of the papacy's demands for sovereignty over Italy as they had been formulated in the eighth century. The popes, too, refused offers of cash payments in exchange for renunciation of temporal power; they feared becoming dependent on imperial largesse. If the confrontation with the emperors, rival claimants to sovereignty over much of central Italy, was not enough, schisms within the papacy (1130-1138, 1159-1177) and especially the rise of the city-states (*comuni*) debilitated papal government within the states. Many *comuni* extorted immunities and privileges from the popes in exchange for promises of loyalty. When, in 1143, a senatorial "renovation" created an antipapal *comune* in Rome, the popes had to

buy off the threat (a competing government in their own city). However, under popes Eugenius III (d. 1153) and Hadrian IV (d. 1159), sizable revenues were collected from the papal states by trusty apostolic chamberlains (papal butlers), indicating that in the right conditions temporal rule was a viable system.

A favorable conjuncture, the imperial crisis of 1197-1202 and the youthfulness of Emperor Frederick II, enabled Pope Innocent III to wrest from the beleaguered emperors recognition of the complete independence and sovereignty of the papal states. Innocent, fortified by fresh support from the Roman *comune* and by the consequent submission of many Umbrian cities, gained Spoleto for the papacy (realizing Hadrian's dream) and asserted papal rule in Emilia, the Marches of Ancona, and Tuscany. Throughout, Innocent spoke of ending "imperial oppression," or reestablishing ancient papal rights. Innocent redesigned the administration, too. His structure, a centralized state divided into provinces ruled by a rector sent from Rome, did not come unglued even during the Hohenstaufen wars, and later popes built on it. A teetering emperor-elect, Rudolf of Hapsburg, was compelled to concede that Romagna, Bologna, and Ferrara belonged to the papacy (1278). Along with territorial gains, the later thirteenth century witnessed further rationalization of papal administration: more regular taxation (the property tax *census*, the military service impost), part of which the college of cardinals enjoyed; and more stable institutions (mints, appellate courts, quasi-regular provincial parliaments to discuss policy) were imposed. Nevertheless, behind these achievements lurked the old realities. Local forces—communal forces in the north and feudal forces in the rural south of the papal states—counted for much more than papal legates or rectors. The papal states remained an assemblage of regional authorities; each had its own special understanding with the papal administration as to its actual rights ("liberties") and obligations.

After 1266, the Angevin dynasty rooted itself firmly in the southern Italian peninsula. This was the last great achievement of the Guelf association that battled imperial influence in Italy during the first portion of the thirteenth century. The Holy See came to rely heavily on the Angevins' political and military clout, though Pope Nicholas III Orsini (d. 1280) attempted to secure Rome's grasp on the states by

appointing other Orsini to all strategic administrative posts. The Sicilian Vespers (1282) was a severe blow to the prestige and power of the house of Anjou, and it pushed the popes into greater reliance on the Colonna family for control of the heartlands of the papal states (1280s and 1290s) around Rome. Weakened as it was, the Angevin influence in the papal states remained strong enough for the papacy to be criticized by contemporaries for excessive Francophilia. Nevertheless, the new situation of close alliance with the French dynasty did not strengthen papal authority over the pugnacious *comuni* in the Romagnol, Tuscan, Etrurian, and Umbrian regions of the papal states. Nor did the emergence of one man rule (*signoria*) in many *comuni* as the thirteenth century waned contribute to the ability of the papacy to exert its temporal power (some *comuni* may have welcomed papal influence as an antidote to the *signori*, however). Just before the Avignonese exile of the popes, therefore, the papal states remained a fissile, weak collection of territories, though not by any means poor or, when compared with contemporary European monarchies, poorly run. The renowned pontificate of Boniface VIII Caetani (1294-1303) saw no consolidation or pacification of the states; on the contrary, the pope's efforts to aggrandize his own family incensed many of the older Roman dynasties, such as the powerful Colonna, and his antimonarchical fiscal policies shook the long-standing alliance between the papacy and the French. A combined, brutal punitive expedition by the French and the Colonna trapped the pope at Anagni (1303) and easily toppled Boniface from power. The events revealed the fragility of the pope's power base in central Italy and the endurance of autonomy in its outlying regions. Ironically, in Provencal Avignon, far from their central Italian dominions, the popes were to find the tranquillity and independence that the papal states theoretically guaranteed.

With the popes and the curia absent, the papal states were exposed to aggression from outside the borders and to the creation of more extensive autonomy within. Almost immediately after the popes had settled at Avignon, Venice snatched Ferrara and held it in the face of the papacy's fulminations (1308-1313). Viscontian Milan lost no occasion to stir up trouble in far Emilia (Bologna, which finally submitted to papal rule in 1327, was the big prize there). Florence, too, tried to occupy papal territory. Assorted *signori* extorted papal

recognition of their independence in the form of grandiloquent titles (apostolic vicar). Periodic invasions from across the Alps by emperors or kings (1310-1313, 1327-1330) aroused the Ghibelline enthusiasm of Dante but served to destabilize central Italy even more. The Angevins, who should have been the protectors of papal interests, patronized noble clans seeking to carve out autonomous statelets for themselves, and pursued independent diplomatic goals often at odds with those of the Holy See. In this chaotic political climate the messianic leader of the Roman populace, Cola di Rienzo, was actually able to institute a dictatorship in Rome (1347) and wrest the capital of the papal states from the pope's control. While Cola attempted to inspire a new "holy Italy" of allied cities led from Rome (he was eventually murdered in 1354), the authority of the papal government both inside and outside Rome fell to a nadir. From Avignon, the papacy attempted a reaction. The administration of the papal states, which grew increasingly French and clerical (laymen had been common enough in the thirteenth-century bureaucracy) during the Avignonesse decades, was made answerable to specially appointed papal legates. Two of these—Bertrand du Poujet and the former archbishop of Toledo, Cardinal Albornoz (d. 1367)—had some success in bringing central Italy back to allegiance to the papacy. Albornoz campaigned relentlessly; built castles; and negotiated with *comuni*, *signori*, and the Italian powers in his effort to render the papal states governable. In 1357, he promulgated the *Constitutions of the Holy Mother Church* (also called *Constitutiones aegidianae*), a public law code that remained in effect in the papal states until the Napoleonic wars. These *Constitutions*, crafted out of provincial law and earlier legates' redactions, regulated relations between the papacy and the commune and fixed the role of the papal courts, which always competed with other jurisdiction within the papal states. They were Albornoz's most statesmanlike achievement.

Despite his tireless labors, Albornoz was not able to reduce the papal states to obedience. Revolts by the peasants, depredations by the mercenaries, and the enmity of the Visconti impoverished the states and inhibited papal government. Only after long campaigns and a treaty with the Visconti did peace return. When it did, Florence promptly organized a widespread insurrection against clerical "rapacity," known as the "war of the eight saints" (1375). Of the papal

states, a small portion around Rome alone had been pacified when Pope Gregory XI (d. 1378) returned to Rome in January 1376. On the verge of the Great Schism (1378-1417), which entailed ulterior dissolution of its temporal power, the Holy See had very tenuous control over its patrimony. This situation had proved chronic since the early eighth century, for the regional, local, and centrifugal forces in the Italian peninsula were at least as vigorous as the popes and the papal administrators who sought to build and govern their central Italian monarchy.

The prolonged struggle of the successors of Saint Peter and their emissaries to bring tracts of central Italy under their temporal control was an important part of medieval papal history. Few popes became so embroiled in central Italian politics and warfare that they lost sight of the governance of the Christian community which the bishop of Rome exercised. The desire to rule the Italian territories collectively called the papal states was born in the 700s of the popes' pastoral mission and the ensuing administrative responsibilities; it developed also because the Lateran grew uneasy about other powers' dominance over Italy. Temporal rule by the successors of Saint Peter, carried out however falteringly in central Italy, was a fact of life after the early 700s. Having virtually lost control of the papal states in the tenth century, the Holy See launched new policies of direct government over its dominions that culminated in the pontificate of Innocent III. In practice, however, the popes were never able to uproot from within their borders aristocratic particularism and the autonomy of the city-states. However, at no time was there sustained criticism in Italy of the idea of papal temporal authority (Arnold of Brescia was an eloquent exception). Many people theorized, on the contrary, that an independent territorial base for the papacy was a prerequisite if vigorous, morally upright leadership was to prevail in the church.

Parlantino da Firenze

Parlantino (who lived at about the same time as Dante) was the author of a political sonnet on the invasion of Italy by German troops under Henry VII of Luxembourg (1310). The poem, *Com crederete voi che si punisca*, follows the tradition of hurling invectives against a political faction, a city, or a nation by poets such as Guittone d'Arezzo, Dante Alighieri, and several comic poets. Parlatino is himself customarily anthologized as a comic poet because of the popularity of the political theme among Rustico Filippi, Folgore da San Gimignano, Pietro dei Faintinelli, and others. However, there is nothing humorous about his sonnet. In it, he depicts the Germans as merciless punishers of arrogant and proud Lombards and Tuscans, recalling the language of Guittone's political *canzone* *Ahi lasso, or è stagion de doler tanto* and the political *canti* of the *Divine Comedy*.

Parma

Parma is situated in the Po valley, at the intersection of the Via Emilia and the ancient roads leading inland from the Mediterranean coast and port cities. The crossing of two streams—the Parma, which flows into the Po; and the Bargaña—also explains the location of the city. The site was originally settled in the Bronze Age; it eventually became a Roman military outpost, and the urban center developed in the second century B.C. The Roman city square is still discernible today in Piazza Nuova, and ruins of a Roman theater and amphitheater have also been preserved. Roman citizenship was extended to eligible inhabitants of Parma in A.D. 49. Under the Roman administration, much of the swamp land surrounding the city was reclaimed for agriculture. Rome also maintained rivers and streams for navigation and built roads such as the Via Emilia, which permitted overland travel by administrators and wealthy merchants throughout the Italian peninsula. Like most Roman cities, Parma was essentially an administrative center, supported by the collection of taxes for the benefit of landed aristocrats; but because of its location at the intersection of the Via Emilia and coastal roads, commercial activity flourished there.

Italy is a land of cities, as Hegel noted, and throughout the 500 years that separated the collapse of the Roman empire in late fifth century and the nascent communes, Italian urban life endured. However, compared with Milan, Pavia, Verona, and Ravenna, Parma was a backwater. The city was already in decline by the fourth century, losing arable lands to swamp land and forest. Even the church, a fundamental institution in Italian urban life from the third century on, barely survived, despite the fact that Parma was an episcopal seat.

The Ostrogoth Theodoric established rule in Italy in 489. An able administrator, he endeavored to rebuild the Roman infrastructure. Because Parma had a strategic position on the road leading from the Alpine Cisa Pass to central Italy and Rome, it played a key role in the Theodoric's territorial ambitions. Under the Ostrogoths, a canal was

constructed connecting Parma to the lifeline of the Po River system. The Byzantine emperor Justinian (r. 527-565) enlarged the city. Byzantine rule was contested by the Lombards, whose conquest of most of the Italian peninsula began in 568. During the 200 years when the Lombards were dominant, a decentralization of power precluded large-scale projects like the drainage of the Po valley or the maintenance of navigable waterways, and trade declined. Militarily, Parma was a spearhead of the Lombards' resistance against the Byzantines, and the city's walls may actually have been enlarged during this period, although little archaeological or archival evidence has survived.

Ecclesiastical archival material from the Carolingian era offers a better record of institutional, social, political, and economic development. Charlemagne was invited into Italy by Pope Hadrian I to defend Rome from the Lombards' aggression. Under Carolingian rule, which began in 774, Parma became an essential strategic point in the defense of papal territory in central Italy. Jurisdiction over and protection of the city and surrounding territory, including the vitally important approach to the Cisa Pass, were entrusted to a count, who in turn granted hereditary lands with limited jurisdictional autonomy, known as patrimonial jurisdictions, to lesser nobles, a practice that led to the erosion of the count's authority. The first count of whom we have any record is Adalgis, in 835, who was a member of the powerful Supponide family that had extensive holdings throughout northern Italy. By the eleventh century, the church dominated in Parma both politically and economically. Carloman, the great-grandson of Charlemagne, had granted the city of Parma—the most important patrimonial jurisdiction of the county—to Bishop Wilbode in 879; Emperor Conrad II granted the entire county to the bishop of Parma in 1036, reinforcing the close ties between the imperial party and the church of Parma. The counts and bishops were charged with the responsibility of defending the Cisa Pass for the emperor. The church's agricultural interests, numerous edifices, and market made it an employer and landlord of a significant proportion of the population. It consolidated its power in the city and throughout the county by supporting the younger sons of local nobles with ecclesiastical benefices. Rapid demographic growth in the eleventh century accelerated the subdivision of jurisdictions by the ruling oligarchy of

nobles and clerics, increasing the tax burden on those excluded from power. In 1037, when Emperor Conrad II was in residence at the episcopal palace, a group that apparently included artisans, merchants, and other citizens (referred to in the chronicles as *cives*, *urbani*, and *Parmenses*) staged an unsuccessful revolt against the ecclesiastical and imperial overlords. Parma was burned, and its walls were leveled.

Intramural ecclesiastical reform promised significant economic, political, and social change in the second half of the eleventh century. This reform challenged the legitimacy of churches closely allied with royal or imperial power, including the church in Parma. The objective of the reform was twofold: to extend the power of the papacy over local bishops and to root out corrupt and worldly practices among the clergy, such as simony and cohabitation with concubines. The bishop of Parma, Cadalus, came from a powerful Veronese family, and he spearheaded the resistance to reform in northern Italy. In 1061, Cadalus was elected as the antipope Honorius II by the antireformist bishops of the region; he led an army against Rome in 1062, and then again two years later, but both incursions were repulsed. Popes Alexander II (r. 1061-1073) and Gregory VII (r. 1073-1085), champions of church renewal, succeeded in isolating the church of Parma by strengthening the Roman position in surrounding cities and the pro-reform nobility within the city. Parma finally capitulated to the reformist camp in 1094 when the schismatic Bishop Vido died, and the papal legate Bernard degli Ubertini was invited to become the bishop there. The cathedral, begun in 1059, reflects the political fortune of the city's bishops: its apse, which is the oldest section that survives, reaffirms architectural ideals associated with Cadalus's imperial church, while the sculptured saints' lives that animate the interior of the cathedral and its facade resonate with the spirituality of Cluny and the reformed church. In 1106, Pope Paschal II presided over a ceremony in which the cathedral was consecrated and the reformist Bernard was invested as bishop.

The reform of the church promoted the formation of the commune because it disrupted traditional political authority and allowed local groups to manipulate the powerful adversaries to their own advantage. Cadalus made jurisdictional concessions to the citizenry to bolster support for his schismatic position, and the construction of a new episcopal palace initiated in 1055 outside the city walls signified this

redistribution of power. When Parma joined the Roman camp, Bishop Bernard made the citizens protectors of the church, and then he granted military and juridical authority to the citizenry in 1119-1120, when the city came under attack by its pro-imperial neighbor, Cremona.

The term "commune" first appears in a document dating from 1149; in the same year, "consul" is used in a peace treaty to denote the eight officers entrusted to act in the name of the people and the church of Parma. However, reconciliation or *concordia* between the various factions of citizens, at the heart of the commune ideal, remained elusive in Parma. In Parma, the concept of civic lordship implied a fragile dominion of urban over rustic aristocrats. In fact, the independence of the aristocratic holdings beyond the walls of the city and the inability of the communal or urban government to extend its rule to the surrounding territory presented a perennial and intractable problem. When the aristocratic families were ousted from power, they simply retreated to their holdings outside the city to plot their return. The commune was, for most of its history, controlled by an oligarchy of ancient and emerging aristocratic families, and the church remained a powerful player. The citizens were divided into *civis minores* and *cives maiores*, according to documents: the *minores* were the artisan class that was gradually assuming a civic role alongside the hereditary landholders, the *maiores*. There was also a growing population of urban dwellers who were not citizens, as Parma (like other Italian cities) emancipated serfs under its jurisdiction, motivated by Christian brotherhood and a need for industrial workers. Local statutes favored the production and merchandising of wool, the principal product of the region, which had been noted since antiquity for its high quality. The location of the city fostered commerce, and Parmesan merchants bartered throughout Italy and with transalpine tradesmen in Parma and abroad.

Baptistry, Parma. Photograph courtesy of John W. Barker.

Civic and religious construction continued with edifices such as the elegant octagonal baptistry, begun c. 1197, which is regarded as the masterwork of the architect and sculptor Benedetto Antelami. Very little is known about the life of this innovative artist: he is thought to have been born c. 1150, perhaps in the region of Lombardy known as Antelamo, and he left Parma in 1216, when the baptistry was still unfinished. Although Parma is a city of art, no distinct style emerges until the late fifteenth century and the sixteenth century. In the monuments surviving from the Middle Ages, indigenous Lombard

architectural ideals blend with structural and decorative elements from France and elsewhere.

Throughout the twelfth century, intermittent warfare ravaged the Po valley. Conflicts during the first half of the century between Parma and its powerful neighbor Cremona—which dominated the middle Po valley, with its port and markets—first erupted in 1120. Although Parma was historically a pro-imperial city, relations between it and the Holy Roman Empire became hostile in the twelfth century. Frederick I Barbarossa was crowned emperor in 1152, after a century of decline in imperial authority. In the interim, the communes in northern Italy had proclaimed their independence (*libertas*) and had appropriated judicial, legislative, and financial authority. Frederick Barbarossa tried to reassert imperial sovereignty in Lombardy, but the cities of the region, including Parma, formed a league and thwarted his ambition by achieving a military victory at Legnano in 1176. The existence of an interurban alliance did not prevent warfare among the cities: in the same period Parma joined Pavia, Lodi, and Cremona in the destruction of Milan,

Parma engaged in a series of deadly encounters with the armies of the emperor Frederick II between 1247 and 1250. The imperial party had established jurisdiction in the city and had then lost it in 1247, when the brother-in-law of Pope Innocent IV, Bernard Orlando Rossi, and the papal legate, Gregory of Montelongo, captured the city with a small host of exiles and killed its imperial overlord. Frederick II determined to recapture it. In the autumn of 1247, he established a siege city outside Parma's walls, optimistically called Victoria, where he set up court, complete with his menagerie of exotic animals and his harem. Although Piacenza, Milan, and the Estensi supported Parma, Frederick and his agents, Ezzelino da Romano and Oberto Pallavicino, were able to organize an effective land and water blockade of the city. The starving citizens, led by Gregory of Montelongo, resisted heroically. Whereas Frederick relied on mercenary soldiers, Gregory had at his command citizen-soldiers who were deeply concerned with their independence and, perhaps even more urgently, with the need to protect the city from the well-known savagery of the emperor. On 18 February 1248, the citizens of Parma liberated themselves from the imperial siege and in the process wreaked havoc on the imperial camp. While Frederick was

out hunting, the Parmesans tricked the only military commander left in Victoria into pursuing a small band of soldiers. The citizens then attacked the siege city, killing or putting to flight the defending forces. They razed and burned Victoria and executed Thaddeus of Suessa, one of the emperor's most trusted officials. Prisoners, livestock, and the imperial treasure—including the crown and seal—were taken. Despite this resounding defeat and humiliation, Frederick and his allies rallied and prevailed in the military encounters with Parma that took place over the next three years. Dante observes of the people of Parma: "They may have had their victory over Victoria, but they certainly had many pains for their pains afterwards" (*Epis- tola*, 6.19; Molthenius 1968, 42). In 1253, Parma signed a peace accord that concluded the conflict. It is easy to let the dramatic events of history obscure the day-to-day reality: throughout this entire episode, as the chronicler and Franciscan friar Salimbene de Adam notes, many merchants, artisans, and other nonpartisans quietly went about their business (Jones 1997, 601).

The second half of the thirteenth century in Parma is characterized by economic prosperity, demographic growth, and political turmoil. The aggregate population of the teeming cities of Parma, Reggio, Modena, and Bologna, located at 15-mile (24-kilometer) intervals along the Via Emilia, has been estimated by Hyde (1973, 154) at 100,000—rivaling Milan, Florence, Venice, Genoa, and Paris. Political instability plagued Parma because its institutions were insufficiently robust to control or mediate between the factions that vied for power. Ordinances restricting the participation of powerful families in government were passed in Parma, as elsewhere in Italy, but they never proved to be enforceable. If vestiges of the commune survived longer in Parma than in some other northern Italian cities where *podestà* were invited to establish order, it is because in the thirteenth century, as in the previous century, an oligarchy of families competed for ascendancy, and none was strong enough to permanently subdue the others. The Pailavicino family, which had lost ground in the defeat of its ally Frederick II, continued to be a factor in the region, and it struggled against the Da Correggio, Da Cornazzano, Rossi, Sanvitale, Da Palu, and Lupi clans. The instability of the situation was aggravated by the proximity of the Scaligeri of Verona and the Visconti of Milan; both of these powerful families sought to control the wealthy and strategically located city of

Parma as well as its *contado* (countryside). The aristocratic families of Parma sought alliances with the Scaligeri and the Visconti through marriage: Ghilberto da Correggio's daughter married Cangrande della Scala's brother, and two future lords of Parma—Alberto and Mastino della Scala—were children of that union.

The years between 1253 and 1303 are described as a golden period for the communal ideal in Parma. The support of the *cives minores* and *maiores* was solicited by Ghilberto da Gente, who was elected to lead the commune for a five-year term and was then granted a hereditary position, only to be thrown out of power by a popular uprising several years later. If the despotic Ghilberto da Gente is difficult to reconcile with the ideals of civic lordship, at least he oversaw a period of relative peace and stability in Parma. Like other politicians in Lombardy, Ghilberto enacted statutes that institutionalized the power of the Guelf party and the pro-Angevin Society of the Cross with the support of the industrial, merchant, jurist, and notary guilds.

The Society of the Cross was the major political faction in Parma, and membership in it ensured the political rights of citizens until the Guelf party split into two warring parts when Ghilberto da Correggio became *podestà* in 1303. Ghilberto da Correggio was a Guelf but ruled with the support of the imperialist Ghibellines. Rival aristocratic families, in this case the Rossi and the Sanvitale clans, retreated to the countryside to await a propitious moment to overturn Ghilberto. In 1316, Gianquirico Sanvitale enlisted the support of the guilds and briefly restored the commune. The Rossi, closely allied to the church, seized power in 1322, and Rolando de' Rossi was named *signore* of Parma in 1328. By 1334, at a time of crisis in the financial situation of the city, Rolando was compelled to create a new ruling council of eight "wise men" to assist him. The chronicles cynically record that the eight were chosen from the special friends of the Rossi clan. Sensing the weakness of the Rossi, Ghilberto da Correggio's sons, allied with the Scaligeri, waged war in the territory surrounding the city, aggravating the economic situation in Parma by interrupting commerce and creating a need for new taxes to support the defense of the city. Civil breakdown resulted from the economic chaos, and Rolando finally capitulated to the Scaligeri in exchange for guarantees for the safety of the Rossi family and its holdings within the city.

The new *podestà*—Alberto della Scala, grandson of Ghilberto da Correggio—was greeted as a savior by the desperate citizens of Parma. His arrival on 21 June 1335 essentially marks the end of the commune ideal in Parma. It was celebrated with pomp and ceremony: accompanied by 3,000 cavalry and a large troop of infantry, Alberto received the venerable citizens of the commune and corporations of Parma and was hailed by all the citizens. The episcopal palace served as his residence. Hundreds of carts of food, wine, and other goods were offered for sale in the streets of Parma at affordable prices. Banners floated throughout the city celebrating the arrival of the Scaligeri, their insignia coupled with those of Emperor Lewis IV (Lewis of Bavaria, Louis, Ludwig) and the da Correggio family, which would reinstate itself in Parma within a few months. Alberto's brother, Mastino, arrived in Parma on 12 October 1335, and his arrival was announced with a similar show of abundance and a celebration of unity and well-being. Alberto and Mastino then retired to Verona, leaving the rule of the city to Azzo and Guido da Correggio.

Although the new regime made a conspicuous effort to reinvigorate the institutions of the city, Parma's financial situation continued to deteriorate. The intervention of Alberto and Mastino della Scala had made Parma a de facto colony of Verona, which levied heavy taxes that inhibited the recovery of Parma's commercial activity. Although both the city and the *contado* were refortified during this period, civil order was not restored and much of the population fled. The winter of 1336-1337 brought famine. Eventually the Scaligeri abandoned any pretext of defending the city, and Azzo da Correggio turned to Milan for military support to wrest Parma from them. He succeeded in 1341, but even with the backing of the Milanese Visconti, he proved unable to resolve the crisis in Parma. In 1344, Mastino della Scala took the opportunity to avenge his loss of Parma to Azzo by pawning the city to the Estensi for 70,000 florins—a move supported by the Rossi, Sanvitale, and Lupi clans. Obizzo III d'Este sold the city back to Luchino Visconti in 1346. Parma enjoyed economic growth under the rule of Luchino and his brothers, who were able, to some extent, to contain the dangerous feuding of the aristocratic families. New canals reunited the city with the Po, commercial restrictions were liberalized, and the urban center was renovated. Yet the difficult medieval ideals of communal *concordia*

and *libertas*, the hope that somehow the lions and the lambs of the city would mediate their differences and achieve an independent peaceful society, was sacrificed as Parma passed from the Scaligeri to the Estensi and finally into the domain of the Visconti in the fourteenth century.

Paschal I, Pope

Pope Paschal I (saint; d. 824, r. 24 January 817-11 February 824) was a Roman by birth. He had a long record of service to his predecessors when he was chosen pope. Anxious to renew Rome's good standing with the Carolingian monarchy, Paschal negotiated with Louis the Pious a confirmation of the Franks' protection of the papal patrimonies, but on terms that granted the popes new elements of autonomy. Paschal's cultivation of the Franks was extended when Louis's son and successor as emperor, Lothair (Lothar)I, visited Italy in 823. Paschal arranged for Lothair's formal investiture in Rome on Easter Sunday, thereby consolidating the tradition that imperial coronation should be by the pope and in Rome. However, Lothair's high-handed behavior generated strong resentment and reflected discredit on Paschal. When Paschal's political enemies attempted to exploit the pope's unpopularity, he lashed out savagely against them and was eventually forced to purge himself of guilt before a church synod. Meanwhile, a revival of Iconoclasm by the Byzantine government obliged Paschal to issue new condemnations of that policy and made him a protector of Greek monks driven into exile.

Paschal was devoted to his native city and was unusually active as a builder, contributing such churches as Santa Prassede, Santa Maria della Navicella, and Santa Cecilia in Trastevere, in all three of which he was memorialized in mosaic portraits. Despite such patronage, he was hated for his arrogance and oppressiveness, with the result that when he died, popular riots made it necessary for his burial to be transferred from Saint Peter's to Santa Prassede.

Paschal II, Pope

Pope Paschal II (Rainerius; d. 1118, r. 13 August 1099—21 January 1118) was born of a noble family at Bieda, south of Faenza in central Italy; his parents were Crescentius and Alfatia. While still a young boy, he was put into a Benedictine monastery. A general belief that he entered the monastery at Cluny was dismissed by Odericus, who confirmed that the monastery was Vallombrosa, between Florence and Arezzo. Rainerius was highly esteemed by his superiors and at age twenty was sent to Rome, where he gained the trust and favor of Pope Gregory VII, who made him cardinal priest of San Clemente. Under Urban II, Rainerius served as legate to Spain. He later became abbot of San Lorenzo Fuori le Mura. His intellectual and spiritual qualities made him an excellent candidate for the papacy and helped secure his election to succeed Pope Urban II. He was highly educated, a promoter of learning and culture; he was also pious, merciful, and forgiving. It was reported that during the conclave, when he realized that the consensus was turning toward him, he attempted to avoid being elected by fleeing, deeming himself unworthy of such an important position.

His pontificate as Paschal II was to prove very difficult because of the struggle between church and the state over the right of investiture for major church offices, but it also saw the initial signs of emancipation of the church from the state, which Gregory VII had worked so hard to achieve. Throughout his reign, Paschal had to fight on many fronts: against the antipopes, the German kings, and the Roman nobles. Paschal also strenuously fostered the crusade movement.

During Paschal's reign, settlements were made between Saint Anselm and Henry I of England and with Philip I of France; but there was a constant struggle with the German king Henry IV, who persistently encouraged and supported the elections of antipopes, in order to undermine the authority of the legitimately elected pope. There was a whole succession of antipopes. At the death of the antipope Guibert of Ravenna (Clement III) in 1100, Theoderic became antipope after a mock

election in Saint Peter's (1101-1102); then came the antipopes Albert (1102) and Sylvester IV (1105—1111). Henry IV was excommunicated by Paschal in 1102 but restored himself to the pope's favor by promising to lead a crusade, although he never fulfilled this promise. In 1104, Henry IV's young son, Henry V, spurred on by disappointed princes, rebelled against his father. Weary of the constant struggle with the king, Paschal made an agreement with his rebellious son. The elder Henry resigned his power at Ingelheim on 31 December 1105, and his son was solemnly crowned emperor at Mainz on 1 February 1106. While the dethroned monarch was getting ready to fight back, he fell ill and died in August 1106.

The struggle between papacy and empire found no resolution with Henry V. From the beginning of his reign, the younger Henry proved just as determined as his father not to give up the right of investiture. Paschal II and Henry V met at Sutri in 1110. Initially, Henry showed willingness to renounce the right to investiture, while the pope committed himself to giving back all lands and rights received from the German crown by the church. However, these conditions were rejected by the German bishops, who considered that they were being deprived of all temporal power. Henry V fled Rome and took the pope with him as a prisoner, until Paschal conceded the right of investiture to the king. Despite the strong opposition of the Roman curia, Paschal crowned Henry V emperor in Saint Peter's on 13 April 1111, as part of their agreement. In September 1112, the emperor was excommunicated by the French bishops because of his capture of the pope and his extortion of the concession regarding investiture. Paschal subsequently confirmed the emperor's excommunication.

While struggling to achieve peace with the empire, Paschal had to fend off revolts in Rome itself. The Corsi family supported the third antipope, and Paschal retaliated by destroying their stronghold on the Capitoline hill.

Soon after his election to the papacy, Paschal, following the lead of his predecessors, congratulated the crusaders for their successes in Palestine and then urged bishops and soldiers to hasten to their help.

Although the relationship between papacy and empire was exceedingly tumultuous during his reign, Paschal's diplomatic accomplishments were instrumental in bringing a conclusion to the

investiture controversy; his pontificate opened the way to the concordat that Pope Calixtus II concluded at Worms in 1122.

Passavanti, Jacopo

Jacopo Passavanti (1302-1357) was born in Florence. He had a distinguished career in the Dominican order, which he entered as a novice in 1317. He began his studies at Santa Maria Novella in Florence, continued them during a stay of three years in Paris (1330-1333), and subsequently taught philosophy at Pisa and theology at Siena and Rome. He also held administrative office in his order: after having been in charge of inspecting Dominican houses in Lombardy in the 1330s, he became prior of the community at Pistoia in 1341, and from 1345 until his death he was prior at Santa Maria Novella, where he had returned as preacher in 1340. He was vicar-general of the diocese of Florence

between 1350 and 1352. As prior of Santa Maria Novella, he presided over the completion of the community's imposing buildings and reorganized the extensive holdings of its library; but his chief claim to fame is his activity as a preacher—according to the community's official obituary, he was *praedicator facundus et fervidus*, "an eloquent and fervent preacher." His *Specchio di vera penitenza* (*Mirror of True Penitence*) is a treatise based on a series of sermons he gave at Santa Maria Novella in 1354, during Lent. (Some minor works—*volgarizzamenti* of a sermon by Origen and oratorical exercises taken from Livy—were also attributed to him in the mid-nineteenth century by Polidori, whose edition is still valuable.)

Jacopo Passavanti, *Lo specchio della vera penitenzia*. Milan: Società Tipografica de' Classici Italiani, 1808. Reproduced from original held by Department of Special Collections of the University Libraries of Notre Dame.

The *Specchio* is divided into five chapters (*distinzioni*), centered, respectively, on pride, humility, vainglory, knowledge, and dreams. Like his Dominican predecessor Cavalca in nearby Pisa, Passavanti brings to his material a masterly narrative technique and a skillful deployment of the contemporary vernacular, especially in the development of moral and spiritual *exempla*. Petrocchi (1965) describes the *Specchio* as *l'opera più ricca e varia della letteratura religiosa del Trecento, anche se non la*

più alta, "the richest and most varied work of religious literature in the *Trecento*, though not the loftiest." A Latin redaction of the *Specchio* was prepared but has not survived.

Pataria

Pataria was a religious and political movement originating in Milan during the second half of the eleventh century. Later the term

"Patarene" came to mean a rebel against ecclesiastical authority or a heretic.

Milan's Patarenes were organized in 1057, soon after the deacon Arialdo da Varese began to preach against clerical concubinage and simony. Milan was then dominated by its archbishop, Guido da Velate, who maintained a powerful alliance of the higher clergy, feudal nobility, and wealthier citizens by astutely manipulating the sale of the city's ecclesiastical offices. To criticize simony or the unchastity of Milan's clergy was to attack the archbishop's unpopular regime, and so Arialdo soon found himself with many supporters. Chief among them were Landolfo Cotta, a notary of Milan's cathedral; and Landolfo's brother Erlembald, a knight. Arialdo's party, now called Pataria (the derivation of the term is uncertain), bound themselves by an oath similar to that of contemporary communal movements and rejected the legitimacy of the simoniacal clergy. Patarenes boycotted the sermons of unworthy clergy, refused their sacraments, and drove the laity from their services. Later they ejected simoniacs from churches and plundered their houses.

Each side accused the other of heresy, and each eventually appealed to the papacy. Papal legates sent to Milan recognized the legitimacy of Patarene ideals but were disturbed by the violent methods of the group. Pope Nicholas II finally approved the Patarenes' boycotts of unworthy clergy in 1059; meanwhile, he tried to draw Archbishop Guido to the side of the reformers. Guido and his clergy did forswear simony and incontinence before papal legates later in 1059, but by the early 1060s they had resumed their old practices, as well as their persecution of the Pataria. This led the next pope, Alexander II, to support the Pataria openly. In 1066 Alexander excommunicated Guido for recognizing the antipope Cadalus of Parma; Guido's supporters responded with a wave of violence; Arialdo was among their victims. In 1070 Guido was finally forced to resign, but almost immediately the Pataria faced a new challenge. The German emperor Henry IV refused to recognize the bishop whom the Pataria elected to succeed Guido, and Henry attempted to force Milan to accept an imperial appointee. Again the papacy strongly supported the Pataria, but the death of Arialdo's successor Erlembald during rioting in 1075 effectively ended the political power of the Patarenes in Milan.

However the Patarene movement meanwhile spread to other cities in northern Italy, including Piacenza, Lodi, Cremona, and Brescia. In Florence a similar movement led by the Vallombrosan monks of Giovanni Gualberto ejected the city's simoniacal archbishop in 1068 and even sent clergy to assist the struggle in Milan,

The Patarenes' activity declined after the 1090s, when Pope Urban II's conciliatory policies toward the bishops of northern Italy produced many of the reforms the Pataria had sought. In the 1140s the term "Pataria" was used to refer to Milanese laymen in rebellion against clerical authority, but this time the clergy were supported by the papacy. "Patarene" and "Pataria" now came to have a pejorative connotation. The Third Lateran Council in 1179 identified Patarenes as heretics; at about the same time, the name was adopted by Cathars in northern Italy. During the next century "Patarene" was sometimes used as a general term for a heretic.

Paul the Deacon

Paul the Deacon (Paius Diaconis, c. 720-c. 799) was the son of Warnefrid and was probably born at Cividale in Friuli. Paul was educated by the grammarian Flavianus, joined the royal court at Pavia, and became tutor to Adelperga, a daughter of the last independent Lombard king, Desiderius (r. 756-774). When Adelperga's husband, Arichis, was made duke of Benevento in 758, Paul became a part of the literary circle that developed at Benevento. There, in 763, Paul wrote his

first poetic work (dedicated to Adelperga), followed by a prose continuation (also dedicated to Adelperga) of Eutropius's *Historia Romanum*.

After Charlemagne's defeat of the Lombards and his assumption of the Lombard crown in 774, Paul retired to the Benedictine monastery at Monte Cassino, where he remained until 783. He then left to seek the court of Charlemagne, ostensibly to plead on behalf of a brother, Arichis, who had been taken prisoner after participating in an unsuccessful revolt in northern Italy in 776. Paul remained at Charlemagne's court for two or three years before returning to Monte Cassino, where he continued to live and write until his death.

Paul is an important figure both in Italian letters and in the early Carolingian renaissance. He wrote in verse and in prose on secular and religious subjects. While he was at Aachen, in addition to a number of literary efforts that were primarily liturgical and homiletic, he composed in honor of the Carolingians a *History of the Bishops of Metz* (*Historia episcoporum Metensium*); after returning to Monte Cassino he produced a number of other works including his last and most important, *History of the Lombards* (*Historia Langobardorum*). This last work, which was never finished, covers the story of the Lombards from their semilegendary beginnings through the reign of King Liutprand (712-744). Paul's history is a typical eighth-century product, relying heavily on the materials available to him: Pliny; Isidore; Gregory of Tours; a work on the Lombards (now lost) by Secundus of Nun from Trent, who was a member of the court circle of King Agilulf (r. 590–616); Bede; and several much shorter and less reliable Lombard chronicles—an interesting commentary on the literary materials available at Monte Cassino in the late eighth century.

Pavia

The city of Pavia (Roman Ticinum, medieval Papia) was founded by the Romans after 89 B.C., probably on the site of some earlier Ligurian or Gallic settlement. The city was built as an *oppidum*, or garrison town, on the characteristic rectilinear Roman street plan. It is situated on high ground sloping down to the left bank of the Ticino River, approximately 3.6 miles (6 kilometers) from its confluence with the Po River. The streets and an extensive sewer system were laid out with careful attention to the configuration of the land and the requirements of drainage. Both the city plan and the sewers (flushed by a continual flow of groundwater) survived throughout the Middle Ages and continued to be important elements in shaping the city's physical structure.

In the fourth century, when Milan became a frequent imperial residence, Pavia served as a subordinate center for the army and its bureaucracy. Although the city lay off the main lines of communication, which during this period ran between Milan and Aquileia, it was nevertheless close to Milan, and its position on the Po-Ticino river system allowed for easy movement of supplies into and out of the city. Like other river towns in northern Italy, Pavia had an imperial arms manufactory, which specialized in making bows. Although Pavia was a small town, it had urban amenities such as baths and an amphitheater which were prized by the army. The small amount of evidence dealing directly with Pavia in this period suggests that the city was relatively prosperous and secure.

Little is known about the origins of the city's Christian community. It is first mentioned in Sulpicius Severus's *Life of Saint Martin* in a passage referring to the 320s, a reference suggesting that a group of

Christians had already been established. Pavia's first bishop, San Siro, probably lived c. mid-fourth century, although the third bishop, Inventius (fl. 380s and 390s), is the first to be firmly datable.

Pavia's role in regional affairs changed in the early fifth century, when current events in northern Italy, and especially in the western Po valley, became crucial for the security of the empire. The transfer of the imperial residence from Milan to Ravenna increased the importance of communications and travel along the Po River, and hence the importance of Pavia, which was now directly connected to the capital by water. Sidonius Apollinaris's description of his trip from Lyon to Ravenna in 467 suggests that travel by water from Pavia to Ravenna was the normal route. The city's continued importance as a military center is indicated by events in the later part of Stilicho's career as *magister militum*: in 405 he defeated an incursion of the Goths with an army stationed at Pavia, and the mutiny in 408 that led to his downfall was centered in Pavia among soldiers at the military hospital.

Pavia was sacked twice in the later fifth century: in 452 by the Huns under Attila and in 476 by Odovacar (Odoacer) during his revolt against the general Orestes and the young emperor Romulus Augustulus. The deposition of the last western Roman emperor may have passed virtually unnoticed, but the events had immediate implications for Pavia: Orestes chose to defend himself in Pavia, and as a consequence the city was captured and burned.

Odovacar's ten years of rule seem to have been relatively peaceful, but when the Ostrogoths entered Italy under Theodoric in 489 they were welcomed into both Pavia and Milan. Milan was soon reconquered by Odovacar's forces, however, and Theodoric retreated to the smaller and more defensible Pavia. The three-year siege that followed was notable for the reasonably peaceful cohabitation of Goths and Romans, thanks to the mediation of Pavia's bishop, Saint Epiphanius. Our knowledge of this period derives in large part from Epiphanius's life, written by Ennodius, one of his immediate successors as bishop of Pavia. The life emphasizes Epiphanius's efforts to negotiate ways of peaceful cohabitation between the local population and the various Germanic conquerors; he was particularly remembered for a series of successful embassies to the Germanic rulers. Modern scholars have understood Epiphanius's prominent role in regional affairs to

indicate not only his personal abilities but also the relative importance of Pavia among the cities of the province of Liguria.

Pavia was one of the few cities of northern Italy where public building continued into the fifth century, owing to the Ostrogoths' royal patronage. Although Theodoric chose Ravenna for his capital, he made Pavia, like Verona, a subsidiary capital, building a palace (*palatium*) there as a residence and administrative center and restoring the city's walls, amphitheater, and baths. Pavia's river port was busy in this period and was surrounded by warehouses storing supplies for the army.

Pavia's importance seems to have declined somewhat under the rule of Theodoric's daughter Amalasuntha, who preferred Milan, with its links to the Roman imperial past. After Ravenna fell to the Byzantine army in 540, however, the headquarters of the Gothic army was moved to Pavia, and the last Gothic kings were elected there before the Byzantine reconquest in the 550s.

When the Lombards invaded northern Italy in 569, the Byzantine forces holding Pavia resisted them for three years. The Lombards eventually seized the city, and it remained an important garrison against Byzantine and Frankish attacks from the west, although there is no evidence that Pavia functioned as a capital in the early period of the

Lombard kingdom. Verona was a frequent residence of the early kings, and Agilulf and Theodelinda resided in Milan and Monza. At least in part as a reaction to the Romanizing tendencies of these rulers, however, subsequent kings gave more attention to Pavia. It was in Pavia that Rothari (r. 636-652) issued his code of Lombard law in 643, and there that he chose to be buried. After Rothari eliminated the Byzantine presence in the province of Liguria, Pavia became still more important as a node of communications between the Po valley and Tuscany, on which the Lombard kingdom was increasingly focused. The Ostrogothic palace continued to serve as a center for the administration of the Lombard royal fisc and the chancery.

When the Lombards first arrived in Pavia in the late sixth century, they seem to have settled in the northeastern corner of the city near the palace, where the Arian cathedral was also located. Catholic worship was probably centered in the extramural basilicas of San Gervasio e Protasio (where the relics of the first bishop, San Siro, were located) and Santi Nazario e Celso to the northwest of the city.

The second half of the seventh century saw a wave of new church building in Pavia. Especially after the official conversion of the Lombards from Arianism under Perctarit (661-662, 672-688) and Cunipert (679-700), many of these churches were royal foundations which served as burial sites for the kings. The most famous of Pavia's monasteries, San Pietro in Ciel d'Oro, was founded or reendowed by King Luitprand c. 723, when he brought the relics of Saint Augustine from Sardinia to be housed there with the body of Severinus Boethius, who had been executed in Pavia under Theodoric in 525; Luitprand was subsequently buried in the church.

The transfer of the cathedral to its present site near the center of the city may also date from this period: it may have been moved under Bishop Damianus (r. 680-711) in the context of the official conversion of the Lombards, although some scholars have argued that Pavia already had an intramural cathedral on that site in the fifth century. The church of Santa Maria del Popolo, which was later connected to Santo Stefano as half of the "double cathedral," was built or enlarged by a private individual during the reign of Liutprand (712-744).

Some evidence indicates that in Lombard Pavia, as in other cities during this period, settlement became less dense, as more land within the city was given over to agriculture. In Pavia, however, this ruralization of the urban space was accompanied by an increase in the extent of the built-up area, as streets immediately within the walls were gradually used as building sites. The two trends may have offset each other, and consequently the general picture of a sharp decline in population in the Italian towns in this period may not be applicable to Pavia. Likewise, the survival of the Roman street plan and the sewer system suggests that some maintenance was carried out, and that the idea of public rights-of-way and urban amenities was not lost. Indeed, most of the buildings in Pavia which do cut across public streets are royal foundations, suggesting that the rights over roadways remained in royal control.

The fall of the Lombard kingdom to Charlemagne has been seen as the end of the period of Pavia's greatest importance as a capital city. Recently, however, it has been suggested that Pavia's influence may have been greatest in the later ninth century and the early tenth century. That Charlemagne's reign in Italy was dated from his entry into Pavia in 774 indicates the importance the city had acquired as the capital of the Lombard kingdom. The early Carolingian kings of Italy, however, favored Milan as a residence, as the location of their principal

mint, and as a burial place. Nevertheless, there is no reason to think that Pavia lost the status of a capital. Lothair I (Lothar, 817-855) and Louis II (r. 844-875) enhanced Pavia's prestige, and both kings resided there frequently during certain periods of their reigns. The translation—which may have taken place at this period—of the relics of Pavia's first bishop, San Siro, from the extramural church of Santi Gervasio e Protasio to the cathedral church of Santo Stefano in the center of the city has also been explained as part of a "revalorization" of the city's status as capital. A capitulary issued by Lothair in 825 required students from a large area of northern Italy to attend the school at Pavia: the area included most of modern Lombardy and Piedmont as well as Genoa. The presence of Dungal—an Irish monk and teacher—in Pavia during these years also enhanced the city's reputation for scholarship.

The fifty years after Louis II's death saw intense competition for the kingdom of Italy, and possession of the kingdom turned largely on the occupation of Pavia and especially of the palace. Indeed, some scholars describe the later part of this period as a series of "races for the capital" by weak kings seeking the political legitimacy that Pavia alone could give them.

The disorder of these times reached its height in 924, when the city was burned by the Magyars, who may have begun their siege on the orders of Berengar I. Most of the early medieval descriptions of the city were written to lament its destruction. Liudprand of Cremona, for example, spoke of molten rivers of precious metals running into the sewers. The magnitude of destruction is suggested by the fact that only one of Pavia's monasteries preserves any documents from before the fire. The city seems, however, to have recovered rapidly: Rudolf of Burgundy was able to stay in Pavia in August 924, and the royal mint continued to function. Hugh of Provence (r. 926-947) rebuilt the palace, confirmed the goods and privileges of several monasteries, and attracted to his court men of religion and learning like Odo of Cluny.

For a time after the death of Hugh's son Lothar (d. 950), power alternated between Berengar II and Otto I, who had made his first claim to rule the kingdom of Italy in 951. After 967, Otto consolidated his power in Italy and began to hold imperial assemblies at Ravenna: he divided his time in Italy between Ravenna and Pavia, and the connection between the two cities along the Po once again became of

primary importance. Pavia has been described as the "capital of the queens" in the period following Otto's death in 983, since both Otto I's widow Adelaide and Otto II's wife Theophano often resided in the city and took considerable interest in the financial functions of the palace. Adelaide, in particular, was also active in reforming Pavia's monasteries in conjunction with the abbots of Cluny Maiolus and Odilo.

Politically, Pavia's importance in the ninth and tenth centuries was centered in the palace; it, and not the city, was the true capital of the kingdom of Italy. The palace served as the royal residence, the center of the administration of justice, the seat of the chancery, the center of the financial organization of the kingdom, and the site of warehouses and workshops. Nevertheless, the palace and the city were closely connected as regards economic activity, especially since the number of people associated with the palace must have made Pavia an unusually large center of consumption. For example, *Honorantie civitatis Papie*, a text that describes the financial workings of the palace probably in the later tenth century, gives the size of Pavia's fishing fleet (excluding the king's own fishermen) as sixty ships. From at least the tenth century, there were many water mills. Finally, it has been calculated that the mint would have produced about 23,000 *denarii* a year in the tenth and eleventh centuries; thanks to its consistently high quality, Pavia's money was used throughout the peninsula until the twelfth century.

In addition to being an important local and regional market, Pavia was also a major market for luxury goods. Its river port was extensive and busy, and the city lay on the main road between France and Rome. Traders from Venice, Amalfi, and Salerno brought fine eastern fabrics, spices, cosmetics, worked ivory, and precious stones, while Anglo-Saxons brought northern European products—dogs, lances and swords, skins, slaves, and horses.

Of Pavia's citizenry in this period we know relatively little. The most visible group are the judges and notaries who worked out of the palace and whose culture and wealth seem to have been substantial. Two judges, for example, led a failed revolt against Hugh of Provence c. 927; and in the early eleventh century, Cunibert, also a judge, became the count of the palace. Cunibert's son was later able to combine the office with the comital offices of Pavia and Lomello, and all three offices became hereditary in the family. The influence of this group is also

suggested by the fact that of the many new churches founded in the Ottonian period, at least two were endowed by judges.

The bishops of Pavia were exempt from the control of the archbishop of Milan and enjoyed the right of consecration by the pope, privileges which may date back to the seventh century and the conversion of Pavia's last Arian bishop. Despite these prerogatives, they found it difficult to expand their influence in the city or the diocese because of the frequent presence of the king, the number and power of local exempt monasteries, and the proximity of the archbishopric of Milan. Even Bishop Peter III (r. 966-983), whose service as archchancellor of Italy under Otto II led him eventually to become Pope John XIV, was largely unsuccessful in increasing his influence over the royal monasteries.

Pavia remained a small city (the Roman wall contained only about 20-25 hectares, or 55 acres), although suburbs began to develop during the later tenth century. The city was characterized by a relatively high proportion of ecclesiastical buildings, since many bishoprics and important monasteries maintained properties there, probably for convenience in attending imperial assemblies and to participate in the city's economic life. The early eleventh century saw the first of the private towers that would become characteristic of the later city; also dating from this period is the oldest part of the Torre Civica, which stood beside the cathedral as a symbol of civic identity until its collapse in 1989.

After Otto III's death in 1002, the succession in the kingdom of Italy was again contested, and Pavia saw two coronations in the church of San Michele Maggiore—that of Arduin in 1002 and that of Henry II in 1004. Henry's coronation was followed by a revolt of the Pavians, the causes and aims of which are obscure. In 1024, news of Henry's death reached Pavia: the citizens then systematically destroyed the palace, obliterating it so thoroughly that its exact location remains a matter for scholarly debate. The meaning of the action does not seem to have been anti-imperial; it was perhaps aimed rather at removing or loosening the economic control that the palace officials exercised over the city. Thus, Pavian ambassadors were sent in the usual way to the new king Conrad II, although two years of war followed, before peace could be made between the city and the emperor.

The events of the year 1024 represent a largely symbolic break in the history of Pavia. Although the palace was never rebuilt, little seems to have changed in either the economic life or the local government of the city. By 1024, the counts of the palace had already transferred their center to the nearby town of Lomello, yet they seem to have continued to govern Pavia; they retained a residence (*domus*) in the city until the mid-twelfth century. There is some evidence that the officials of the royal palace continued to exercise their functions, and the continued strength of Pavia's coinage suggests continued royal oversight. Some of the functions of the palace may have been relocated to San Pietro in Ciel d'Oro: *placita* (judicial assemblies) were held there, and the monastery had a school which may have continued the palace school. The emperors may have used the monastery as a residence, although, with the exception of Henry IV, they stayed in Pavia less and less often. The power of Pavia's bishops during this period is difficult to assess: unlike other contemporary bishops, they never controlled the city, but they have been described as an important "reference point" in urban affairs; they may have served, for example, as presidents of the *placita*.

Pavia's greatest importance in this period lay in the legal activity of its judges and teachers. Lanfranc of Bee (later archbishop of Canterbury) probably received his early training in the liberal arts and law in Pavia before his departure for France c. 1030. Especially in the last third of the eleventh century, there is evidence of a flourishing legal culture in Pavia, although whether there was an actual school that specialized in teaching law is debated.

In the twelfth and thirteenth centuries, Pavia's generally pro-imperial stance affected its history in important ways. Frederick I Barbarossa received the crown of the Lombard kingdom in the church of San Michele Maggiore in 1155. In a diploma of 1164, he granted Pavia extensive rights of self-government, including the free election of the city's consuls. This diploma sanctioned the city's existing laws and customs, gave the city control over a large territory, and removed the city entirely from the jurisdiction of the count palatine. Thus, Pavia gained through its alliance with the empire a degree of freedom from imperial control which the other Lombard cities would not obtain until the aftermath of the peace of Constance twenty years later.

During this period, Pavia was governed by consuls and by a council

of 150 members. A *podestà* appears first in 1179 and had replaced the consuls by the early thirteenth century. In 1198, the consuls took over the *domus* of the count palatine in the episcopal palace and rebuilt it as the town hall (*broletto*).

The twelfth century also saw a wave of rebuilding of the city's churches. San Michele Maggiore (the church in which Frederick I and many previous kings of the Italian kingdom had been crowned) was rebuilt in Lombard Romanesque style, with a characteristic flat, screenlike facade. San Michele was probably influenced by Sant'Ambrogio in Milan and in turn became a model for other Pavian churches rebuilt during this period, including San Pietro in Ciel d'Oro and the twin cathedral churches of Santo Stefano and Santa Maria del Popolo.

Pavia maintained its pro-imperial stance into the thirteenth century, and in 1219 the commune's privileges were confirmed by Frederick II. Attitudes toward the empire also affected Pavia's internal politics. From the later twelfth century, the *popolo* had played an increasing role in the city's government; by the later thirteenth century, separate organizations of the *popolo*, the nobles, and the notaries had formed, each with its own *podestà*. The *popolo* and the notaries were closely associated, and when the nobles split in the 1260s over Conradin's attempt to claim the imperial succession, the pro-imperial faction associated itself with these two groups. It has been argued, however, that these divisions did not result in the political dominance of the *popolo* and its associated organizations; instead, the commune continued to be ruled by the *podestà*, the council of *credendarii*, and (in the later part of the century) a smaller council of *sapientes*. The powers of the *podestà* of the individual organizations, although potentially extensive, continued to be delegated to them by the communal council.

The twelfth and thirteenth centuries also saw some important changes in the economic life of the city. Pavia's coinage declined into a purely communal currency, perhaps reflecting the decline of imperial control over the mint. At the same time, Genoa began to replace Venice as the city's major trading partner; to ensure tighter control of trade, Pavia developed its own road across the Apennines to Genoa in the thirteenth century. Trade between Genoa and Milan also increased, since Milan relied on Genoa for raw materials for its thriving cloth

industry. This economic rivalry between Pavia and Milan may have been one reason for Milan's continued attempts to bring Pavia under its domination in the fourteenth century.

In the later thirteenth century and the early fourteenth century, regional alliances—loosely organized around pro-imperial sentiments on the one hand, and pro-papal, pro-Angevin sentiments on the other—also shaped Pavia's political life. In 1254, Pavia joined a number of other Lombard cities under the signory of Ubertus Pellavicino. In the 1270s, the marquis of Monferrato became "defender" of Pavia, again bringing Pavia into a larger regional grouping of cities over which he exercised various degrees of authority. Both of these experiments kept Pavia in the sphere of pro-imperial alliances. In the early fourteenth century, however, Pavia was ruled by Count Filippone de Langosco, an important figure in the pro-papal politics of the region. This change in Pavia's political orientation was a further cause for enmity with the generally pro-imperial Visconti family of Milan.

In 1315, Pavia was attacked and captured by its own exiles in conjunction with Galeazzo Visconti. Luchino Visconti served as *podestà* for four years; subsequently we know little about the precise relationship between Pavia and the Visconti. Opicino de Canistris, author of a description of Pavia that is a major source for this period, speaks of a "lord" (*dominus generalis*) placed over the older communal institutions. Chroniclers from other cities describe some type of alliance between Pavia and the Visconti or mention Pavia as a tributary, but the information is scarce and contradictory. Pavia seems to have used the descent of Emperor Lewis (Louis, Ludwig) of Bavaria into Italy in 1329 to move away from any direct control by the Visconti, and the city later maintained close connections with the marquis of Monferrato.

In the years between the capture of Pavia in 1315 and its final fall to the Visconti in 1359, Opicino's vivid description of the city shows us that it was prosperous, though small (modern estimates place the population at 20,000 in the mid-thirteenth century). In this work, which Opicino wrote in exile in Avignon during the last years of the commune's independent existence, the city is structured physically by its three concentric rings of walls, and from a distance the private towers form an impressive skyline. The citizens' lives center on the piazza in front of the cathedral, where business is transacted; the city's

small size allows the citizens to meet one another daily.

A war between Milan and Monferrato led the Visconti to besiege Pavia in 1356; following a peace in 1358, the war was renewed, and Pavia fell definitively to Galeazzo II in 1359. Jacopo Bussolaro, an Augustinian friar who was probably a native of Pavia, led the defense of the city. His preaching called for the moral reform of the citizens and for liberty from the tyranny of the Beccaria family that ruled Pavia. Invoking antique models, Bussolaro rallied the Pavians to expel the Beccaria, and then to resist the Visconti; he became, for the Florentine chronicler Giovanni Villani, the model of the power of eloquence to overcome the mighty.

The takeover by the Visconti in 1359 brought significant changes in government. Galeazzo Visconti now selected the major officials, including a vicar-general, a *podestà*, a referendary to oversee financial matters, and a magistrate for water rights and roads. At the civic level, a *consiglio di provvisione* with twelve members effectively governed the city, and a *consiglio generale* with 200 members met when summoned by the prince to discuss matters of general concern to the commune. Both councils were composed equally of Guelfs and Ghibellines.

Under the Visconti, Pavia became an important cultural center. Galeazzo obtained imperial authority to establish a university there in 1361 and ordered that it serve as the place of higher learning for all residents of the Visconti domains. He resided frequently at the *castello*, and he invited Petrarch to Pavia in 1363. Petrarch lived in Pavia on and off between 1363 and 1369; he described the city in a letter to Boccaccio in 1365, discussing its history and praising its location and climate.

The Visconti signory also brought about important changes in the physical structure of the city. A large *piazza* was opened up near the center of the city, cutting across the main east-west artery, the ancient Roman *decumanus*, and closed at the south end by the *broletto*. This pulled the city's center away from the cathedral, back toward the central crossing of the two main streets, lessening the importance of the *piazza* in front of the cathedral, which had been for Opicino the main gathering place of the citizens. The north-south street that ran to the river (the Roman *cardo*) was widened and straightened; it joined the covered bridge over the Ticino, which had been rebuilt in 1351-1355, to Galeazzo's magnificent new *castello* on the northern edge of the city. In

contrast to Opicino's early fourteenth-century description of Pavia as a set of concentric circles, a fresco painted in the early sixteenth century depicts a densely inhabited rectangular space: the tall family towers blend into the background; and the image is dominated by the river, the bridge, and the *castello*, joined along a central axis by a sharply delineated roadway, the *strada nuova*, cutting through the city's center.

Pazzi Family

There were two unrelated Pazzi lineages in the city and countryside (*contado*) of Florence: the Pazzi of the Arno valley between Florence and Arezzo (Pazzi del Valdarno) and the urban Pazzi. The former were among the most powerful Ghibelline nobles of the Florentine countryside. Emperors Henry VI and Frederick I had both identified them as vassals of the Guidi counts. In the thirteenth and fourteenth centuries, the Pazzi del Valdarno and the Ubertini resisted Florence's

political and military expansion into the Arno valley. Their castles became refuges for Florentine exiles, and they often allied with the Aretines against Florence. In the Florentine ordinances of justice of 1293, they appeared among the magnates of the *contado* excluded from participation in the highest political offices. In 1296, the Florentines established two new settlements—San Giovanni Valdarno and Castelfranco di Sopra—to protect the city from the Pazzi del Valdarno, the Ubertini, and the Aretines. Like other Ghibelline lineages, the Pazzi were allies of the White Guelfs of Florence.

Like the Cavalcanti, Donati, Tosinghi, Adimari, and Buondelmonti, the Pazzi of the city were originally members of the traditional Guelf aristocracy. In the first half of the thirteenth century, they formed a *consorteria* with another Guelf lineage, the Donati. Along with the Visdomini and Tosinghi, these Pazzi sided with the Donati in their feud with the Adimari and their allies at the end of the thirteenth century. Several Pazzi were inscribed in the money changers' guild (*cambio*) in the thirteenth and fourteenth centuries. Pazzino dei Pazzi and his relatives originally sided with Corso Donati and the Blacks against the Cerchi in the opening stages of the conflict between the Blacks and Whites in 1300. However, in 1303 Pazzino, Rosso della Tosa, and Geri Spini eventually broke with Corso over the distribution of offices and favors within the city.

Peasants

In a medieval European context, peasants are the people without history. At best, most texts caricature them as the humble *laboratores*, as in the classic tripartite model of "those who pray, those who fight, and those who work." As a result, little real understanding of peasants'

beliefs and cultural customs can now be had. Sympathy and even recognition are therefore difficult, particularly because Latin writers used an array of other names for peasants: *rusticus*, *paganus*, *illiteratus*, *colonus*, *servus*, and *aldius* could all mean "peasant" in one context and some other social type in another. And since there is no reason to assume that the meanings of words remained at all constant during the medieval period, any attempt to trace peasant history over a millennium is likely to be difficult and unavoidably impressionistic. Take, for example, the word *colonus*, which historians have found tricky: although it could clearly mean peasant in late Roman and medieval documents, it is also equated with *servus* (normally slave or serf) in an edict of Theodoric the Ostrogoth and appears as *coloni liberi* and *coloni servi* in some eighth-century charters. So a study of words alone will not get us very far toward even a simple definition of the medieval Italian peasant. For the purposes of this entry, we can accept Crone's definition of peasants as "rural cultivators whose surplus was forcibly transferred to a dominant group of rulers" (1989). However, even an ostensibly simple statement such as this is problematic, immediately raising issues about the crucial importance of subsistence rather than surplus to peasants, degrees of freedom and unfreedom within the rural population, and the supposed existence of the "free peasant farmer." What follows concentrates on those areas of medieval Italian society where historians have explicitly discovered peasants (*contadini* in Italian): essentially the structures of agricultural production and rural life, the development of communities of peasants, and the forms of oppression suffered by the rural population.

Between c. A.D. 200 and 600, the classic estates of the Roman countryside based on large gangs of slaves for their workforce disappeared as, by some process which is little understood, slaves were "freed" to become serfs or peasants. It may be that the plagues and wars of the sixth and seventh centuries made this change to a different type of rural economy possible. The devastations of the countryside must have encouraged a move to more subsistence production based on smaller estates or even single peasant households. Certainly, as the long-distance trading networks that had supplied the great Roman cities broke down, there was less need for intensive cash-crop production of the sort suited to slave labor. The emergence of the

"peasant household" has preoccupied many historians and requires specific discussion, as it remained the basic unit of rural production throughout the Middle Ages in Italy.

Little is known about the material character of peasant dwellings in Italy, because archaeological investigation into them is just beginning. Most work has concentrated on the ninth and tenth centuries; and, predictably, where there is information, it shows peasant homes as materially impoverished. Galetti (1983) has shown that the typical pattern across the Po valley was a house, courtyard, kitchen garden, and associated land. Sizes varied but tended to be small. Households all over Italy usually had a mean size of four or five persons; i.e., it can be assumed that most consisted of a single nuclear family. Some were larger, as brothers and their families sometimes lived together or widows lived with their children. Here, as elsewhere in Europe, "polyptychs"—inventories of landed properties carried out by great monastic houses in the ninth and tenth centuries—provide the most explicit evidence about peasant family structure. In Italy, the most useful polyptychs are those of San Colombano at Bobbio, Santa Giulia at Brescia, and San Salvatore at Farfa. Ring (1972) has found that at Farfa most peasant families practiced partible inheritance: the family property was passed from father to all children, especially the males. Occasionally brothers and other kinsmen held land jointly. However, even these are at best very partial records covering simply the monastic estates, and we usually have little way of telling if the settlement and social patterns found there had wider currency. These compact households seem to have been well-suited to subsistence production, but in fact their role within the rural economy was rather more complicated than that.

The first complication concerns their occurrence across the rural landscape as a whole: that is, were they gathered into nucleated settlements or more dispersed over the land? In general, nucleated settlement was the norm in the medieval Italian countryside. Peasant households were grouped into hamlets or villages, often focused on a church or castle. In central Italy, many such settlements were on fortified hilltops, particularly after the deliberate transference of settlements from the plains to the hills—a process essentially of the late ninth and tenth centuries known by the shorthand term

incastellamento. Nucleation could result in cooperation among peasants in communal activities, but also in easy domination of the peasant community by the local lord. Dispersed settlement was more common in mountain areas, for straightforward topographical reasons; thus these areas tended to be less amenable to practical lordly domination.

The second complication concerns the relationship between these supposedly self-sufficient peasant households and the networks of estates that we also find in the documents. How did the peasant *casa* fit within the lord's *Curtis*? Here we arrive at the crux of peasant life in the medieval period. There appear to have been very few societies indeed where peasants were truly free of institutionalized obligations to the powerful, such as periodic labor service on estates (*corvées*), the provision of rents in kind or cash, and the return of tithe. The success with which lords dominated their peasants is a key to understanding the Italian Middle Ages, for on this the survival of a complex society rested. In particular, the extraction of surplus from the peasantry formed the basic income of lords and, to an extent, determined the status of slave, serf, and "free" peasant. Most of this surplus went unrecorded, but we can assume that it was common. We do know, from the records of the great monasteries, that wide-ranging demands were made on peasants; these demands were sometimes written down (especially in the later Middle Ages) but often remained simply customary. It is in these obligations that the differing social positions of "peasants" are most visible. Labor service obligations varied widely. In general they were fairly light in Italy, confined to a few days of work for the lord each year, usually at harvest time. Peasants could be involved in cultivation (planting, weeding, pruning), harvesting (especially threshing), or transportation. However, in some parts of the Po valley such obligations were more intense, especially on the great monastic estates of Nonantola and Bobbio. Transport obligations especially could involve travel over considerable distances and were often the subject of *libellus* records (written agricultural contracts) in monastic archives. For example, in a charter of 897, the monastery of Sant'Ambrogio at Milan demanded that one of its tenants living in Bozzolo (in the Modenese) take his annual food render all the way to the village of Cavenago, where the monastery had a *dispentium*, some 60 miles (100 kilometers) away to the west. Therefore, transport

obligations were at times resisted; indeed, they seem to have occasioned complaints that this was the work of slaves (*servi*). In some places, obligations may have been institutionalized on a regular, even weekly basis; for example, Andreolli (1983) has noticed this in the 760s at Pistoia and Monza. The reason, of course, may have had to do not with agriculture as such but rather with ensuring effective political domination.

If the peasant was able to produce a surplus, there was a chance that some would be left over for the peasant himself to dispose of outside of the estate system: i.e., at a local market. Whether peasants made use of local markets is most problematic in the early Middle Ages, when the evidence for markets themselves is hardly common. The vitality of smallholders' initiatives, such as land clearance, has been stressed by Davies (1988) and Dockès (1984) with reference to French examples as early as the mid-ninth century. But Duby (1974) has taken the concept of "peasant gains" as most characteristic of the period after 1000. It seems fairly certain that around the end of the tenth century, many peasants began to escape from the confines of the great manors. In the great leases of that period, we begin to read of vacant plots, labor shortages, and the flight of dependents to the flourishing towns—not everywhere, of course, but mostly in the north and especially near Pavia and Milan. The reason for these developments is unclear. Partly, it was a need to find money rents, which were increasingly demanded by lords instead of rents in kind. Possibly, some peasant families managed to profit from such transactions, move into the city, and thus escape peasant status. But for those left behind, the pressures exerted by lords were greater.

Simple exploitation of peasants by lords was one impetus for change. Another was the conflict between peasant and lord on which Marx placed such weight. This becomes most visible in the later Middle Ages in Italy in the form of the rural communes and rebellions, which were essentially caused by this conflict. To understand this properly, we have to go back to the beginning of the Middle Ages. At that time, most peasants did not live in isolation: as has been seen, they tended to live in communities, where some communal agricultural activities were practiced. In many areas, at some point in the early medieval period there is some reference to communal fields or pasture, fields belonging

to the village. But it is unclear if these were actually owned in common by the villagers. Boggetti (1978) and others believed strongly in the existence of the community of the village, constituted socially and legally as well as agriculturally from before the Roman period, a notion which recent scholars have attacked as anachronistic. Not until the ninth century can we sometimes see the local community in action against outsiders, notably when it was under threat from lordly demands perceived as unreasonable. The classic conflict of lord and peasant is illustrated by two instances of complaints by peasants living on estates owned by the monasteries of San Vincenzo al Volturno and Sant'Ambrogio at Milan. In both cases, labor services were at issue, and it is clear that both monasteries were trying to impose increased demands, which were resisted by the peasants (referred to as *servi*) on the grounds of customary practice. Between 779 and 872, there were a series of court cases between the monastery of San Vincenzo and the inhabitants of the village of Carapelle (Valle Trita in the Abruzzi). Wickham (1981, 1982, 1984, 1989) has concluded that as a result of the prolonged resistance of the locals to monastic aggression, feudal control was imposed over previously free peasants. In the case of Sant'Ambrogio, the peasants of Limonta (an estate near Lake Como) had a long dispute with the monastery which resulted in the production of a written charter recording their precise, increased obligations. After this we never hear of the Limonta peasants in such a context again.

Such events probably paved the way for the emergence of rural communes in the twelfth and thirteenth centuries, periods for which there is much better evidence. Communes helped to define the collective rights of the peasant community and to run the village in a basically consensual fashion (although the richer peasants took the lead). The result was often fierce conflict with local lords who refused to give up political control over the rural population. The peasant rising near Parma in 1385 was the beginning of numerous rebellions in the fifteenth century, directed against unjust taxation and lordly misgovernment.

In the period before 1000, political power over peasants had been very much the concern of the highest lords of all: kings. Peasants were all too often caught between the demands of the state and their immediate lords. The Carolingian capitularies are preoccupied with the

public obligations of free men, the *arimanni*. The *arimannus* would not have been a typical peasant—only the richest would have been able to afford the armor required in the laws—but the monarchs' concern came about because local lords were in general deemed to be oppressing the poor. With the collapse of royal power c. 1000, there was little to protect the weak from the castle-owning *domini*; as a result, feudal powers (of command) came increasingly to be exercised over the peasantry. Peasants' access to public courts declined, and increasingly they were subject to judicial oppression by local gentry. This marked the start of the decline of the peasantry, which can be observed all over Italy in the later Middle Ages.

For some peasants, the thirteenth century saw the start of a better life: real land ownership, different work (such as dock labor), and of course the consolidation of collective rights. But others lost out, becoming leaseholders or simply traveling wage laborers (as is well evidenced in the south from the twelfth century on). Divisive hierarchies began to develop within peasant society, and the downtrodden became the butt of refined literature. In some ways the "golden age" for the Italian peasants was the period between the end of the Roman empire and the ninth century, when they had few centralized taxes to pay and more surplus to keep and were subjected only to as yet underdeveloped powers of local justice. Afterward, "the normal life of grinding extortion for the peasant classes" (Wickham 1984) returned.

Il pecorone (*The Big Sheep, The Big Booby*) was written in the latter half of the fourteenth century by *ser* Giovanni Fiorentino, about whom we know very little. The preface dates the beginning of the work to 1378, but events referred to in the stories occurred as late as 1385; thus the book was probably compiled over a number of years. A poem at the beginning, possibly also by *ser* Giovanni, claims that the author knows nothing about writing books; and indeed the style is plain.

The framing narrative concerns a beautiful, honest nun of Forlì and a young man from a good family who becomes chaplain to the convent in order to be near her. Although these two are in love with each other, they chastely spend their time together telling each other a story apiece for twenty-five days. The monk's name, Aurette, may be an anagram for *auttore*, "author," especially as the author claims at the end to have been present on many of the occasions. As in Boccaccio's *Decameron*, each day ends with a song (*ballata*); the freshness and charm of these twenty-five songs have generally won more praise than the prose.

The tales combine stories of love and fantasy (of which the best-known became a source for *The Merchant of Venice*) with episodes of Roman and Florentine history. More than thirty tales toward the end of the book are taken directly from Giovanni Villani's chronicles of Florence. The final tale is a bawdy parody of the frame story, which is left unresolved.

The collection was recopied during the fifteenth century and was first printed in Milan in 1558. It has been reprinted a few times during every century since then.

Pegolotti, Francesco di Balduccio

Francesco di Balduccio Pegolotti (born c. 1280s) was a Florentine factor for the great Bardi banking house in the first half of the fourteenth century, until its failure in 1347. His name appears in 1310 in the firm's payroll for the branch in Florence, at a rate which suggests that he already had considerable experience. His work was rewarded with promotions to positions of greater importance. In 1315, he negotiated trade rights for Florentines in Antwerp. From 1318 to 1321, as director of the firm's English office, he had duties that included financial transactions to help finance the English king, private business, and transferral of the tithes collected in England to the papal curia. Pegolotti next moved to Cyprus, where he remained until 1329; again, his job involved diplomacy, handling papal monies, and handling monies for individual merchants. He returned to Florence in order to hold civic office but then moved back to the east by 1335. In 1340, he returned again to Florence, for the last time. The last known mention of him is in 1347, when he was one of the civic officials overseeing the liquidation of the assets of the bankrupt Bardi firm.

Pegolotti is best known not for his service to the Bardi but for the compilation of his observations on trade now known as *La pratica della mercatura*. The oldest known manuscript, from 1472, is a copy made by Filippo di Niccolao Frescobaldi in the Riccardian Library in

Florence. The manuscript has evident inaccuracies, which can be attributed to the copyist; these include misreadings that arose when the copyist was trying to expand the original abbreviations, and chapters that are out of place. Internal evidence, such as the mention of current kings, helps to show that the material in the *Practica* was collected throughout Pegolotti's career with the Bardi, and also that it was not written down all at one time.

The *Practica* is one of a "genre" of documents called merchant manuals. It is by far the best-known because historians have used Pegolotti's discussion of the route to Cathay as proof that Europeans had knowledge of and easy access to the Silk Road. The data come from Pegolotti's experience and from documents he collected that had something to do with his work—such as a list of brokerage fees charged in Pisa, quoted from the *Breve dell' Ordine del Mare* of 1323. The section on Cathay is almost certainly based on information Pegolotti collected rather than on personal experience. The manual contains information on conversions for weights, measures, and currencies between various places, as well as discussions of other topics such as the steps involved in producing the most important commodities of a particular region and the expenses involved in producing coins. The *Practica* is among the earliest known merchant manuals, but it is possible that Pegolotti borrowed some of his material from still earlier manuals, just as later manuals would borrow from his. This type of book probably functioned as an exemplar to teach apprentices how international trade worked, not as a reference for absolute values or information,

Pelagius and Pelagianism

In the late fourth century, Christianity was no longer the religion of a persecuted minority; it was the religion of the empire. One of the main issues that faced the church was to agree on the correct way to believe and practice the Christian faith. A pious reformer, Pelagius (c. 354-after 418), precipitated a theological crisis when he tried to reform Christian behavior.

Pelagius was born in Britain. Around 380, he went to Rome, where he tried to improve the conduct of complacent Christians, urging them to lead more virtuous lives. Pelagius acquired a reputation for asceticism and a large following. In Rome, he became acquainted with two men—Celestius and Rufinus the Syrian—who joined him in his belief that Christians had the capacity, and thus the obligation, to avoid sin.

At the same time, Augustine was arguing that fallen humanity was incapable of virtue without continuing help from God in the form of divine grace. Between 402 and 405, Pelagius disagreed with this view of grace, as expressed in Book 10 of Augustine's *Confessions*, and wrote several tracts (*On the Trinity*, *Extracts*, and *Commentary on the Pauline Epistles*) opposing it. Pelagius's works (seven complete tracts and letters survive) established a controversy which was to engage Augustine for the rest of his life and which involved Jerome, two popes, an emperor, and the Roman people.

The core of the debate was how to achieve salvation: Pelagius stressed free will, claiming that people had the absolute freedom to choose good or evil. According to Pelagius, God's grace had been expressed historically: by his creation; by his revelation in the scriptures, which taught people to choose good; and by his promise of redemption—forgiveness of sins—through the crucifixion of Jesus. For Pelagius, God had done as much as was necessary; it remained for humanity to choose salvation. Augustine, on the other hand, believed that Adam's initial free choice had condemned all future generations to sinfulness. Adam's original sin was passed down physically from parent to child, and this inherited sinfulness had robbed humanity of its free choice. People were powerless to be virtuous and so were condemned to sin. Salvation lay only in God's power to grant grace to individuals to keep them from sin. Augustine saw grace as an ongoing gift that was necessary for the salvation of fallen humanity.

This profound difference between Augustine and Pelagius led to other disputes. Pelagians denied original sin, whereas Augustinians considered original sin central to the human experience. They also differed on the efficacy of infant baptism. Augustinians believed that baptism was crucial, to cleanse the infant from the inherited sin of Adam. Pelagius himself was noncommittal on this question, but other Pelagians, such as Celestius, denied the efficacy of infant baptism, since infants were not yet capable of exerting their free will to choose the good.

The debate was conducted by an exchange of treatises during the early fifth century, and ecclesiastical and public opinion wavered between the two positions. In 416, Pelagius and Celestius were condemned by North African councils, and Pope Innocent I upheld

these decisions by threatening to excommunicate the Pelagians unless they renounced their opinions. Innocent's successor Zosimus reversed the decision and remained ambivalent for a while.

In 418, Roman supporters of Pelagianism took matters into their own hands and rioted, attacking a retired official. This unrest brought Emperor Honorius into the conflict. He condemned the Pelagians and ordered Pelagius and Celestius to be banished from Rome. The Council of Carthage followed up with a series of canons against Pelagianism, and Pope Zosimus finally bowed to pressure and excommunicated Pelagius. Pelagius probably went to Egypt and soon afterward died there.

Eighteen Italian bishops, led by Julian of Eclanum, continued the Pelagian cause. They had been deposed for refusing to renounce their support of Pelagianism. Julian engaged in a vehement dialogue with the aging Augustine until Augustine's death in 430. In 431, the Council of Ephesus condemned the Pelagian position once again and confirmed the deposition of Julian and the other dissenting Italian bishops. Julian died in Sicily between 443 and 445.

Pelagius. Hartmann Schedel, *Liber chronicarum* (*Nuremberg Chronicle*).
Nuremberg: Anton Koberger, 1493, p. 135r.

The fifth-century councils established the Augustinian position as orthodoxy. However, the Pelagian issue of the relationship between free will and grace continued to engage theologians through the Reformation and into the twentieth century.

Pepin (777-810), son of Charlemagne, was an important figure in the integration of northern Italy into the Frankish kingdom. He was named Carloman at birth but was renamed Pepin on the occasion of his baptism in 781 by Pope Hadrian I. At this same time, at his father's behest, Pepin was anointed and crowned by the pope as king of the Lombards, ruling over an Italian subkingdom.

Pepin's kingship was marked by some signs of autonomy. He presided over his own court; he summoned assemblies of magnates to deliberate on affairs of state; his officials carried out administrative functions, including the administration of justice under Lombard law; and he issued capitularies dealing with problems unique to his kingdom. Perhaps this appearance of autonomy was calculated to assuage the feeling of ethnic identity existing among the recently conquered Lombards. In reality, during Pepin's reign the main course of events in Italy was controlled by Charlemagne in the interests of pacifying his Italian subjects, extending his Italian holdings, and exercising his protectorship over the papacy and the papal state. Charlemagne controlled Italy through a variety of techniques, including especially the assignment of trusted agents to supervise Pepin's court, the appointment of Frankish magnates as counts and bishops in Italy, and the granting of landed benefices in Italy to Franks willing to settle there as royal vassals. To all of this Pepin acceded, apparently anxious to play a part in promoting the interests of the Carolingian dynasty. He figured most prominently in serving his father's cause as the leader of the military forces raised in his kingdom to join in the Frankish wars of expansion. Troops under his command were involved in campaigns against the Bavarians, the Avars, the Beneventans, and the Byzantines.

The existence of Italy as a quasi-independent entity within the larger Frankish empire was clearly recognized in the provisions made by Charlemagne in 806 to provide an inheritance for each of his three sons. This *divisio* provided that Pepin would inherit the kingdom of Italy, to which would be added Bavaria and southern Alemannia. Pepin did not live to enjoy his father's inheritance, but in 813 his own son, Bernard, was installed as king of the Italian subkingdom.

Pepin III the Short

Pepin III (714-768), called "the Short" by later historians, played a key role in establishing the Carolingian family as the predominant force in the west. In 741 Pepin and his brother Carloman succeeded their father, Charles Martel, as joint holders of the office of mayor of the palace, an office that had been successfully exploited by Charles Martel (in 714-741) and his father, Pepin II of Herstal (in 687-714), to the point where they exercised real power at the expense of the Merovingian kings of the Franks whom they supposedly served. From 741 to 747 Pepin III and Carloman acted jointly to withstand threats to their position, especially from the dukes of Bavaria, Aquitaine, and Alemannia who were seeking to escape Frankish overlordship. They strengthened their ties with the church by supporting the missionary and reforming efforts of the Anglo-Saxon monk Boniface, acting in Francia under papal auspices.

In 747 Carloman withdrew from his office to become a monk. Pepin assumed sole power and soon decided to assume the royal office. To legitimize this bold act against the claims of the Merovingian dynasty,

he sought and received the approval of Pope Zacharias I (r. 741-752). In 751 Pepin deposed the last Merovingian king and had himself elected king by the Frankish magnates and anointed by a bishop, an innovation in Frankish history that gave a sacramental character to the royal office.

Pepin's accession to the royal office soon led to his involvement in Italian affairs. By the mid-eighth century a crisis had developed in Italy as a result of the decline of Byzantine power. The papacy, which had established control over the territory around Rome, was challenged by the Lombards, who in 751 seized Byzantine territories around Ravenna (called the Exarchate) and threatened Rome. Pope Stephen II (r. 752-757) turned to Pepin for protection and in late 753 traveled to Francia to negotiate with him. The result was a promise by Pepin to protect the pope and his Roman subjects and to restore to the papacy territories that Stephen claimed the Lombard had illegally seized. In return, Stephen reanointed Pepin and his sons and invested them with the title *patricius Romanorum*, which implied a role as protector of the Romans. Pepin made good his promise by conducting successful military campaigns against the Lombards in 755 and 756. He forced the Lombards to surrender to the papacy considerable territories legally belonging to the Byzantine empire. This "Donation of Pepin," coupled with the territory around Rome that the papacy already controlled, formed the basis of an independent papal state stretching across the Italian peninsula from Rome to Ravenna. During the remainder of his reign Pepin honored his role as protector of the papacy and the "republic of Rome" by using diplomatic means to restrain the Lombards.

As king of the Franks, Pepin was mainly concerned with solidifying and expanding the power and prestige of the royal office. He effectively used force to increase the Franks' control over Bavaria and Aquitaine and to ward off attacks by the pagan Saxons. He took the lead in promoting reform of the church, a role that gave substance to his claim to rule as an agent of God promoting the true faith. The expanding influence of the Franks in Italy and southern Gaul led to diplomatic exchanges with the Byzantine empire and the Abbasid caliphs of the Muslim world. By the end of his reign, the first Carolingian king of the Franks had expanded the position of his people to the status of a major power.

Percivalle Doria

The poet Percivalle Doria (d. 1264), called *messer Prezivalle Dore* in Vatican Codex 3793, was descended from the illustrious Doria family of Genoa. Between 1228 and 1243, he held the position of *podestà* in Asti, Aries, Avignon, Parma, and Pavia, and in 1258 he was Manfred's official representative in the dukedom of Spoleto, the March of Ancona, and the Romagna province. Percivalle died during an attempt to cross the Nera River.

Chronologically, Percivalle is the last poet of the Sicilian school, and he is its northernmost exponent. He may also lay claim to being its only bilingual practitioner, as the author of two *canzoni* (*Come to giorno quand'è dal maitino* and *Amor m'à priso*) in the Sicilian medium and a *serventese* in Provençal.

Perugia

Perugia is situated on a high hill overlooking the valley of the Tiber River. It was an ancient Umbrian settlement which became, with Cortona and Arezzo, one of the leading Etruscan cities, one of the twelve *lucumoniae*. Perugia became involved with the Romans in the late fourth century B.C., and although it joined forces with other Italian cities against Rome, it was gradually drawn into Roman alliance. In particular, Perugia remained loyal to Rome during the war with Hannibal; and after the defeat of the Roman army by Hannibal at Lake Trasimene (21 July 217 B.C.), Perugia became a *municipium*. The massive ancient walls of the city, large sections of which are still visible, were constructed in the second century B.C. In the conflict between Octavian (the future Emperor Augustus) and Mark Antony, Perugia was destroyed, but it was subsequently rebuilt by its conqueror, Augustus, and renamed Augusta Perusia; thus Perugia entered into a period of prosperity in the Roman imperial age.

During the Ostrogothic wars of Justinian's reconquest, Perugia changed hands several times. According to legend, it was besieged and taken by Totila in 547, after heroic resistance by its bishop, Saint

Ercolano, who encouraged his fellow townspeople to valiant acts. Ercolano was martyred (decapitated) by the Ostrogoths, and his remains are kept in the altar of an eponymous octagonal church constructed on the site of his martyrdom.

With the coming of the Lombards, Perugia was made the seat of a duchy (592), but it was overshadowed by that of Spoleto. Perugia's Lombard identity was challenged by the Byzantine exarchate of Ravenna and the papal states. By the eleventh century, Perugia played a balancing role in the struggles among local cities, while maintaining good relations with both sides during the investiture controversy and even escaping the devastation visited on other cities of the area by the German forces under Frederick I Barbarossa in 1174.

In 1139, the first references to a municipal government under consuls appear, and there are further indications through the twelfth century of the development of Perugia's commune, whose rights were formally recognized in 1186 by Emperor Henry VI. In the last years of the twelfth century, Perugia subjugated numerous surrounding towns, including Città di Castello (1180), Gubbio (1183), and Assisi (1205). In a bull of 1198, Pope Innocent III confirmed the rights granted by the emperor and consolidated Perugia's strong ties to the papacy. On 16 July 1216, Innocent III died in Perugia, where the conclave to elect his successor, Honorius III, was held. Another conclave, with a decidedly different outcome, took place in 1305 after the death of Pope Benedict XI (7 July 1304). On this occasion, Bertrand de Got—the archbishop of Bordeaux from Gascony—was elected Pope Clement V (5 June 1305), and it was he who moved the papacy to Avignon.

In the early years of the thirteenth century, internal politics were torn by family rivalries and divided between loyalty to the papacy and affiliation with the city's guilds. In 1223, the papal legate Giovanni Colonna was sent by Honorius III to suppress internal unrest. With the election of Pope Gregory IX, the political situation in Perugia improved, and the city became a frequent place of refuge for popes (indeed, Gregory stayed there for two years, 1228-1230), even while continuing to cultivate good relations with the Holy Roman emperor.

With regard to civic government, Perugia was ruled by consuls (who were members of the nobility) from 1139 until 1214, when a foreign *podestà* was elected who displaced them. In 1255, the office of *capitano*

delpopolo (captain of the people) was established, and the person who held this office was in effect the financial controller of the commune, sharing power with the *podestà*. The late thirteenth century was characterized by a series of power struggles between magnate families and the *popolani* (common citizens), resulting in new laws that were generally against the magnates, and in the political exile of certain families. These changes in political institutions led to a transformation of the commune into a republic governed by trade guilds. In the late thirteenth century, Perugia was governed by a council of five men, the *consoli delle arti* ("consuls of the arts"), who were members of the trade guilds; this institution lasted from 1266 to 1303. In 1303, there was a serious division in the city between the major merchant guild (*popolo grasso*) and the smaller artisans (*popolo minuto*). Two families emerged as leaders of the two factions: the Baglioni for the *popolo minuto* and the degli Oddi for the *popolo grasso*. The body known as the "consuls of the arts" was replaced in 1303 with a priorate—ten priors, two per district of the city, with the majority coming from the minor guilds. A new office, the *gonfaloniere del popolo e delle arti* ("standard-bearer of the people and the guilds"), was established, and this person was in charge of the city. This form of government endured until the mid-sixteenth century.

By the mid-fourteenth century, Perugia had reached a high point in terms of population (35,000), wealth, and dominance in Umbria, and it continued to wage war with neighboring towns and extend its hegemony. These conflicts came to a climax at the battle of Torrita (1358), when the forces of Perugia defeated those of Siena. In the latter half of the fourteenth century, Perugia found itself caught between the expansionist policies of the Visconti and the efforts of the papacy, which had returned to Rome from Avignon, to reassert regional control. In 1376, the city rebelled against the oppressive policies of the papal vicar, Gerardo Dupuis, abbot of Monmaggiore, thereby participating in a more general series of insurrections in cities and towns throughout central Italy, known as the *guerra degli otto santi* ("war of the eight saints"), which had its origin in Florence. Perugia's reconciliation with the papacy in 1378 ushered in a period of troubled independence under a series of signorial regimes. A brief period of rule by Gian Galeazzo Visconti (1400-1402) was followed by continued periods of internal

factionalism leading to the emergence of the Baglioni family as a recurrently dominating force, in constant conflict with efforts by the papacy to reassert control. Not until the mid-sixteenth century (1540) under Paul III was papal government definitively established.

Church of Sant'Angelo, Perugia. Photograph courtesy of Christopher Kleinhenz.

There are impressive reminders of Perugia's ancient past in surviving Etruscan and Roman relics, of which the most famous are the massive city walls of travertine marble and the great Etruscan-Roman portal known as the Arch of Augustus. The earliest medieval church is Sant'Angelo, dedicated to Saint Michael Archangel; it was built in the fifth century on a circular plan with sixteen ancient Roman columns supporting the drum of the rotunda. In the latter tenth century (964), the basilica of San Pietro was built on the site of the first cathedral; it was commissioned by a Perugian monk of noble origin, Pietro Vincioli, who became its first abbot (San Pietro Abate). The basilica retains the architectonic features of its original construction, but it has undergone many changes in subsequent eras; indeed, its former convent now houses the faculty of agriculture of the University of Perugia (the original *studium* was founded in 1266 and was located in the present-day Piazza Matteotti). The nearby Romanesque church of San Costanzo is named for the first bishop of the city, who died a martyr and was buried there. The present church was rebuilt in 1205 and has a lovely

portal with sculptures in the architrave depicting a blessing Christ and the four evangelists. The church of San Domenico, begun in the early fourteenth century (1304–1305), contains the impressive Gothic funereal monument of Pope Benedict XI (who died in Perugia); this monument (1324-1325) is attributed to Giovanni Pisano but is more likely the work of a follower of Arnolfo di Cambio. The cathedral, in characteristic Gothic style and dedicated to Saint Lawrence, was begun in the mid-fourteenth century (1345) but was not completed until the fifteenth century.

Among the civic buildings, the most notable is the Palazzo dei Priori (or Palazzo Comunale), a formidable structure in Gothic style by the architects Giacomo di Servadio and Giovannello di Benvenuto. Its earliest elements date from the late thirteenth century (1293), but major additions were made over the next two centuries. In the late fourteenth century and the early fifteenth century, certain prominent guilds established their offices in a new wing of the Palazzo dei Priori: the Collegio della Mercanzia (merchants' guild, 1390) and the Collegio del Cambio (money changers' guild, 1457). The offices of the money changers' guild were decorated with frescoes by Perugino. In 1317, the commune entrusted Ambrogio Maitani (Lorenzo's brother) with the job of enlarging the Palazzo dei Priori over a period of twenty-nine years, to 1346. Under his direction, the main portal of the *palazzo*, on its longest side, that on Corso Vannucci, was constructed. Indeed, Ambrogio may have carved the figures of the three patron saints of Perugia—Lawrence, Costanzo, and Ercolano—in the lunette over the doorway, which also is richly decorated with allegorical figures and crests: these reliefs were perhaps executed by Gano da Siena (1340) or by Florentine followers of Andrea Pisano. Above the portal on the main facade opposite the cathedral and at the top of the ceremonial staircase are displayed trophies taken following the victory over Siena at Torrita (1358). These trophies—the chains and bars of the city gates of Siena—are mounted between the civic symbols of Perugia: the bronze figures (1274) of the griffin (for the city of Perugia) and the lion (for the Guelf party) that were cast by the *cire-perdue* process. This doorway leads into the magnificent and spacious Saia dei Notari ("room of the notaries"), formerly known as the Sala del Popolo ("room of the people"), which is used for popular assemblies; in this *sala*, the walls

and vaulting (eight massive arches) are decorated with the crests of the various *podestà* (from 1297 to 1424) and with scenes from legends, fables, and the Old and New Testaments. The decoration of the spandrels has been attributed to Pietro Cavallini and his followers.

In the square between the Palazzo dei Priori and the cathedral is Perugia's most famous monument, the Fontana Grande ("great fountain"). The general plan for the fountain was conceived by Fra Bevignate da Perugia, and the technical assistance for the water supply, brought via a new aboveground aqueduct, was provided by the hydraulic engineer Boninsegna from Venice. The specific design of the fountain is credited to Nicola Pisano and his son Giovanni. The fountain has two polygonal marble basins: the lower basin has twenty-five double relief panels; the upper basin, which is twelve-sided, has twenty-four statuettes. An inscription provides the names of the four artisans and the date of completion, 1278. The relief panels on the lower basin represent the "labors of the months" (with the respective signs of the zodiac), the liberal arts, scenes from the Bible, legends of Rome, and fables. The statuettes on the upper basin depict Old Testament figures, personifications of cities, saints, and contemporary historical figures. On a single support rising from the upper basin of the fountain is a small bronze basin containing a group of three female figures (caryatids), also in bronze cast by the *cire-perdue* process.

The rich artistic atmosphere that prevailed in Perugia from the thirteenth through the fifteenth centuries is not matched in the literary arena, where we find relatively few talented writers. Nevertheless, we do find in the early to mid-fourteenth century a small group of poets generally referred to as the *poeti perugini*—chief among them Marino Ceccoli, Cecco Nuccoli, and Neri Moscoli—who composed a goodly number of sonnets and a few *canzoni*. These compositions, while individually distinct, are related stylistically and thematically and generally belong to the popular comic genre. Most of this poetry treats elements of daily life and presents parodies of the more elevated courtly poetry of the *dolce stil nuovo*, but some of it does take up serious issues: religion, politics, and homosexual love. Thus, although Perugia was not a major center of literary production, it did have several noteworthy poets. One final literary note: in 1293 Bonifacio da Verona was commissioned to compose an epic poem, *Eulisteia* (named for the

legendary founder of the city, Euliste), to celebrate the municipal history and glories of the city of Perugia. This practice was fairly common in medieval Italian cities.

Peruzzi Family

The Peruzzi lineage, perhaps originally known as the Delia Pera, was one of the most powerful and prominent houses in the Florentine ruling class during the thirteenth and fourteenth centuries. Like the Cerchi, the Alberti del Giudice, and the Gherardini, the Peruzzi were originally rural landlords who had moved into the city before the early thirteenth century. In the twelfth century, Ubaldino di Peruzzo, originally from Ruota in the Arno valley, had apparently been the founder of a *consorteria*. Traditionally Guelfs, the Peruzzi were residents of the *sesto* (one of six administrative divisions of the city of Florence) of San Pier Scheraggio.

Their fortune came primarily from moneylending and from the

international trade in finished cloth, and they used their wealth to acquire extensive landed properties in both city and countryside (*contado*). The earliest surviving administrative documents of the Peruzzi company date from 1292, but the company itself seems to have existed at least from 1274. The first account books date from 1308. In 1302, several Peruzzi opened an exchange bank in Naples, establishing close relations with the Angevin regime. However, there is evidence that a small branch had existed in Naples from the 1270s. Like the Bardi, the Peruzzi extended large loans to the Angevin royal house and financed the importation of grain from Apulia and the Abruzzi to Florence in the early fourteenth century. The most prominent branch of the company was founded in 1310 and led by Tommaso, Arnolfo, and Giotto dei Peruzzi. At its height it included twenty-one partners, ten of whom were members of the lineage. They established financial ties throughout the western Mediterranean basin, creating a financial empire that lasted for two centuries. Enriched by international trade (Florentine finished cloth) and their connections to Naples and England, several of the Peruzzi commissioned the artist Giotto to decorate the walls of their chapel (the Peruzzi Chapel) in the Franciscan church of Santa Croce with scenes from the life of Saint Francis. Giotto probably completed the frescos by 1328.

In October 1343, the Peruzzi bank failed; scholars have long argued that this failure occurred because Edward III defaulted on the loans made to him to finance his wars against the king of France. The Bardi company failed in 1346. More recent scholarship has revealed that the failure of both banks resulted primarily from political and economic factors in Florence rather than from loan defaults in England.

At the end of the thirteenth century, the Peruzzi came to assume major positions of political influence in the Guelf regime, commensurate with their economic power. Like a few Portinari and Strozzi, several Peruzzi seem to have formed Ghibelline allegiances before 1266. After that date, however, the Peruzzi became loyal Guelfs. Three members of the house served as priors between 1282 and 1292. The lineage was heavily represented in the money changers' guild (*Arte del Cambio*), but there were also several members in the guild of the wool finishers (*Calimala*) and that of the physicians and apothecaries (*Medici e Speziali*). Unlike the Bardi, the Peruzzi were not among the

magnate lineages stigmatized by the Florentine Ordinances of justice of 1293. Allied with the Medici and Giugni, most Peruzzi had become strongly aligned with the Black Guelfs by 1302. Along with the Bardi, they supported the failed dictatorship of Walter of Brienne in 1343. Relying primarily on their landed income after 1343, the Peruzzi continued to be a wealthy and influential lineage for the remainder of the fourteenth century.

Peter III of Aragon

Peter III of Aragon (Peter II of Catalonia; 1239-1285, r. 1276-1285) was the eldest surviving son of King James I of Aragon and Catalonia, Peter was the figure who brought a Catalan political presence to Italy with the conquest of Sicily in 1282.

In 1262, Peter's father had decided to divide his inheritance among his two legitimate sons, Peter and James; and Peter's reluctance to recognize James's claim to an independent kingdom comprising Majorca, Roussillon, and Montpellier was a sign of his uncompromising position whenever his rights or those of his family were challenged. Within three years of his succession, he had forced James of Majorca to become his vassal (1279). His father assured the papacy that a marriage between Peter and Constance—who was the daughter of its enemy Manfred of Hohenstaufen, king of Sicily—had no implications for Aragonese political interests in the Mediterranean. However, this

assurance was shown to be wishful thinking; Peter was not prepared to accept the claims of the house of Anjou to southern Italy and Sicily, as he made plain at a conference with the French and Majorcan kings in Toulouse in December 1280. The meeting was attended by Charles of Salerno, the heir of Charles I of Anjou, to whom Peter acted in a way that the French and Majorcan kings considered unpardonably rude. On the other hand, Peter and Philip III of France did agree that they were so closely bound by marriage ties that war between them was unthinkable.

Peter may or may not have been intimately involved in planning a rebellion in Sicily, but in any case acted as host to Sicilian and southern Italian exiles such as Giovanni da Procida, who later became his chancellor. In 1282, he announced that he planned to go on a crusade to Collo (Alcoll) in North Africa, but the papacy suspected that he was really hoping to launch an attack on Sicily as soon as its master, Charles of Anjou, who was busily planning a crusade against the Greeks, actually became tied up in the venture. Revolt broke out unexpectedly in Palermo; Peter took advantage of the revolt of the Vespers (in March 1282) to land in Trapani (in August 1282) with a sizable army. With the assent of the nobles and townsmen of Sicily, who had issued an urgent invitation, he laid claim to the entire kingdom of Sicily, both the islands and the mainland territories. Brilliant naval victories by his admiral Roger de Lauria ensured the Catalans' domination of the seas around Sicily, but the invasion of the mainland was slower work than the takeover in Sicily had been. In 1283, Peter had to return home to face a French invasion of Catalonia, in support of his Angevin foes.

Peter never went back to Sicily; he died in Spain in 1285. In his will, he assigned Sicily to his second son, James, aware that the Sicilians sought a king of their own descended from Frederick II.

Peter Lombard

Peter Lombard (c. 1095 or 1100-1160)—a theologian, biblical exegete, and bishop of Paris—was one of the most influential thinkers of the twelfth century. He was born in the region of Novara in Italy and was drawn to study in the schools of northern France, first in the cathedral school at Reims and then in the schools at Paris. In 1136 he arrived in Paris with a letter of introduction from Bernard of Clairvaux to Gilduin, abbot of the well-known community of regular canons at the abbey of Saint-Victor, which was then one of the leading intellectual centers in France. In his writings, Peter shows great familiarity with the work of Hugh of Saint-Victor (d. 1141), the abbey's most prominent thinker. Peter became a master in the Parisian schools by 1143 or 1144. In 1145 he was made a canon of the cathedral of Notre Dame in Paris, a rare honor for one not associated with the royal house and not a relative of the local aristocracy or royal officials. At the Council of Reims (1146), Peter joined Bernard of Clairvaux in opposing the Christology of Gilbert of Poitiers. By 1156, perhaps earlier, Peter was archdeacon of Paris; in 1159, the year before he died, he became bishop of the city.

Peter's most enduring contribution to medieval thought was a systematic investigation of a whole range of questions arising under the topic now designated as theology. His *Sententiae in IV libris distinctae* (*Four Books of Sentences*) became one of the most famous works of medieval theology. The four books, or divisions, are: (1) the Trinity; (2)

creation, human nature, and sin; (3) Christology, the virtues; (4) the sacraments, last things. The *Sententiae* formed the basis of theological education for almost four centuries. Generations of scholars, including Thomas Aquinas, wrote commentaries on it as part of their theological education and teaching. The *Sententiae* has often been presented in modern scholarship as simply a collection of the opinions of earlier authorities on theological topics, but it is now recognized as a sophisticated work that resolves major (and minor) theological issues with skill and insight. Peter applied new methods of twelfth-century theological inquiry and debate in order to resolve currently disputed questions (such as the essential elements of the sacrament of marriage) and conflicts between authorities. Peter's book appeared in final form in 1155-1157 and incorporated references to the works of John of Damascus, which had first become available in 1154 in a Latin translation from the Greek. Although the *Sententiae* was criticized vehemently for some of its conclusions, it was judged orthodox at the Fourth Lateran Council in 1215. Peter made important clarifications in the theology of the sacraments and was among the first to distinguish seven sacraments. The *Sententiae* is notable for its comprehensiveness, for the skill and clarity with which the topics are arranged and presented, and for objectivity which Peter brings to the resolution of difficult matters such as the definition of marriage, the nature of the sacraments, and issues in Christology.

Peter contributed significantly to biblical interpretation with his commentaries on the Psalms and on the letters of Paul. His commentary on the Psalms, completed before 1138, circulated widely, although Herbert of Bosham (one of Peter's students, who edited a deluxe version of the commentary) reports that it was intended for Peter's private use. The commentary on Paul's letters, *Collectanea in omnes b. Pauli epistolas*, was first composed in 1139-1341 and was revised in 1155-1158. Both commentaries were immensely popular. Peter built on the work of earlier eleventh- and twelfth-century exegetes but presented his own work as a continuous commentary on the text rather than as a collection of comments written in the margin or between the lines of the biblical text, as in the contemporary *Glossa ordinaria*. Peter followed the compilers of the *Glossa* by citing texts from patristic authors in full; he followed the example of Gilbert of

Poitier's commentary on the Psalms by adopting the literary form of the *accessus ad auctores* to introduce the book and individual Psalms, and by using a system of marginal marks and symbols to cross-reference passages, themes, and citations. These commentaries incorporated Peter's analysis of theological questions and themes as well as commentary on the verses of each text.

Twenty-four of Peter's sermons are printed under the name of Hildebert of Lavardin in Jacques-Paul Migne's *Patrologia Latina*, and four more have been discovered, relatively recently, in manuscript.

Peter of Eboli

Peter of Eboli (Petrus de Ebulo, d. 1219 or 1220) was the author of two Latin poems notable for their content and also for their historically and artistically significant medieval illustrations.

The first poem, in three books consisting now (there has been some loss of text) of 833 elegiac distichs plus an eight-line "insert" in dactylic hexameters, is known both as *Liber ad honorem Augusti*, or *Book in Honor of the Emperor*, and as *De rebus* (or *motibus*) *Siculis carmen*, or *Song on the Affairs* (or *Rebellions*) of Sicily. This poem treats, partly

from the perspective of an eyewitness, political matters in the kingdom of Sicily from the death of William II (November 1189) to shortly before the death of Henry VI (September 1197)—that is, the transition from the Norman to the Swabian monarchy. Unremitting hostility to William's immediate successor Tancred of Lecce and a strong dose of pro-Swabian panegyric diminish its reliability as a historical source but increase its literary interest. The poem is preserved in a single richly illuminated and codicologically complex manuscript (Bern, Burgerbibliothek, Codex 120 II), seemingly prepared as a presentation copy for Henry. It is no longer believed that Peter was a scribe of this manuscript or that any of the illustrations is his own.

The second poem, in perhaps 237 elegiac distichs (some thirty-nine sections of mostly twelve lines each; a critical edition is lacking), describes the famous thermal baths in and near the Phlegrean Fields west of Naples. It is variously known as *De balneis Puteolanis* (*On the Baths of Pozzuoli*) or *De balneis Terre Laboris* (*On the Baths of the Terra di Lavoro*), and as *Nomina et virtutes balneorum* (*Names and Virtues of Baths*). This account is of interest for the history of medieval medicine and of the region and its tourist industry. The poem, transmitted anonymously and not assigned to Peter until the nineteenth century, could be addressed either to Henry VI or to Henry's son Frederick II; the preponderance of scholarly opinion favors the second alternative. Some twenty-five manuscripts survive, many of which are copiously illuminated. There are also fourteenth-century verse translations in the Neapolitan dialect of Italian and in French, as well as fourteenth-century prose adaptations in Latin and in Italian.

In the dedicatory section of *De balneis Puteolanis*, Peter mentions a *mira Frederici gesta* ("marvelous deeds of Frederick"); this has been thought to refer to Book 3 of *Liber ad honorem Augusti* but is more likely to have been a separate poem, now lost. In that case the Frederick in question would in all probability have been Frederick I Barbarossa.

We know little of Peter apart from the evidence of these two poems. In a prose subscription to *Liber ad honorem Augusti* he identifies himself as the emperor's servant and *fidelis* (a technical term for someone at least occasionally entrusted with official missions); two of the book's illustrations show him in ecclesiastical tonsure. For Peter's services Henry gave him life tenure of a mill at Eboli. The identification

of Peter with a Petrus Ansolinus of that town, proposed in the early twentieth century, is unconvincing.

Petrarca, Francesco

It is a critical commonplace to refer to Dante Alighieri as the "last medieval man" and to Petrarch (Francesco Petrarca, 20 July 1304-19 July 1374) as the "first modern man," but this tends to obscure the many distinctly "medieval" aspects of Petrarch's works. To be sure, Petrarch does anticipate certain characteristics that are central to our (modern) understanding of the changeover in attitudes in the passage from the Middle Ages to the Renaissance: the emphasis on the individual and on secular matters; the minute investigation of the human psyche; the imitation of classical literary forms, style, and language; the understanding of discrete periods in history; and the interest in travel undertaken to see and experience the world. While all these characteristics suggest Petrarch's desire to escape the narrow frame of the religiously and morally proper medieval world, he repeatedly and simultaneously gives evidence of his longing to embrace that same world and its precepts. This constant state of tension is what defines Petrarch's so-called modern sensitivity and allows us, his readers, to identify with him and his seemingly contradictory aspirations; and this sentiment is aptly presented, over and over, in the *Canzoniere*. We find it in the poems themselves, as in the final verses of *canzone* 264 (*I' vo pensando*): *ché co la morte a lato/cerco del viver mio novo consiglio,/e veggio 'l meglio et al peggior m'appiglio* (verses 136-136), of which the final verse is a direct and sympathetic translation from Ovid (*Metamorphoses*, 7.20-21). Or we note how Petrarch has ordered the poetic universe of the *Canzoniere* by juxtaposing poems that praise,

alternately, his love of earthly things and his profound repentance for such an attitude, as, for example, in the positioning of the two sonnets *Benedetto sia 'l giorno, e 'l mese, e l'anno* (61) and *Padre del ciel, dopo i perduti giorni* (62).

In all of Petrarch's works, we recognize the acute eye of the intellectual who carefully observes himself and the world around him and attempts to make some sense of the fragile human condition and its immediate and ultimate purpose within the great order of the cosmos. It is in this unprecedented focus on his own personal situation that we may observe Petrarch's genius and the human drama played out on a small yet universal stage.

While most of his works are ultimately about himself and are thus full of interesting though stylized and carefully crafted bits of autobiographical information, Petrarch did write, late in his life, a *Letter to Posterity* (the Latin title is *Ad posterios* or *Posteritati*), to future generations who might be curious to learn more about him and his life. This fragmentary epistle was first composed in 1367 and was revised in 1370-1371, yet the latest event recounted is from 1351. In the letter, Petrarch intends to speak about himself, his interests, his outlook—in short, about his personality. What strikes the modern reader is the egotism that pervades the letter, the dramatic departure from the more humble attitude generally adopted by medieval authors who were less likely to put themselves and their accomplishments on display in such a self-centered and self-serving way. Although idealized, conventional portraits are common in works of medieval literature and although the *vidas* of the troubadours and Dante's *Vita nuova* present so-called personal data as historical facts, the authorial "I" and the empirical "I" remain distinctly separate persons. With Petrarch, however, we see a dramatic change in the attitude toward autobiography, such that we know more about this fourteenth-century author than about virtually any other person of his age, precisely because the author himself decided that this would be the case. To make sure that we would know about him, Petrarch compiled large collections of letters, made copious annotations on his manuscripts, and left us other pieces of evidence that allow us see and understand his life as he wanted it to be recorded and remembered. Thus, in the *Letter to Posterity*, Petrarch fashions his own identity, creates his own historical persona, and delineates his role in

the events of his time. From other, independent documents we are able to judge the accuracy of the *Letter to Posterity*, and we may conclude that he was a master of self-promotion, acutely aware of his particular place in history. For this reason, we may view him as a precursor of humanistic attitudes on the individual that would emerge in the next centuries.

In the *Letter to Posterity*, Petrarch describes himself as modest and even tempered, as one who prefers sacred literature to vernacular poetry, who is acutely aware of the greatness of antiquity to the impoverished state of his own age, who yearns for the tranquil life of the country and disparages the hectic pace of urban society. While he notes that in his youth he had been overwhelmed by a powerful love, he declares that this is a thing of the past. Despite his voluminous literary production in both Latin and Italian, Petrarch refers only to his works in Latin—his epic poem *Africa*, his treatise on the solitary life (*De vita solitaria*), and his pastoral poems (*Bucolicum carmen*)—for they are the reason for his coronation as poet laureate in Rome atop the Capitoline Hill. As Petrarch tells the story, on the same day (1 September 1340), he received invitations for coronations from the chancellor of the University of Paris and from the Roman senate; to have chosen Paris would have been to give precedence to scholastic culture, and thus his choice of Rome was intended to help restore the ancient glory of that city.

In the *Letter to Posterity*, Petrarch also speaks about his family and friends, his personal habits, his travels, the cities where he lived, and the benefits—for work and mind—of his "transalpine solitude." The last few sentences of the letter speak of Petrarch's affection for Jacopo da Carrara the Younger, ruler of Padua; and while Petrarch would have liked to reside permanently in Padua, Jacopo's untimely death in December 1350 made that impossible. Petrarch notes: "I could stay no longer [in Padua], and I returned to France, not so much from a desire to see again what I had already seen a thousand times as, like a sick man, to be rid of distress by shifting position." This sentence represents perfectly Petrarch's carefully constructed *persona*: he is the restless traveler, the seeker of old manuscripts, the frequenter of ancient sites in an attempt to recapture something of their past glory. The image of the sick man who tries to assuage his pain by shifting position recalls Saint

Augustine's image of the sick woman, who, in allegorical terms, represents the unquiet human soul that will find its peace only in God (*Confessions*, 6.16); however, here Petrarch's frame of reference is limited to earthly life. In this passage, we also observe the drama of his own internal conflict as one caught between earthly attractions and spiritual aspirations, one who, profoundly discontent with his own age, but powerless to change it, dreams of a past grandeur and of a better future time. His confessional work, the *Secretum*, in which Augustine is one of the interlocutors, is concerned with this same conflict.

Life and Works

Petrarch was born in Arezzo to Pietro di Parenzo and Eletta Canigiani. His father, usually called Ser Petracco, was a notary who had migrated to Florence from his hometown of Incisa in the Arno River valley. During the tumultuous early years of the fourteenth century, he made some political enemies in Florence and was exiled on false charges of corruption in public office in October 1302—some nine months after the expulsion of Dante Alighieri on similar grounds. Early in 1305, Petrarch and his mother moved to Incisa, where his brother Gherardo was born in 1307. After six years in Incisa, the family moved to Pisa (1311), where

Francesco may have seen Dante among a group of fellow Florentine exiles. In 1312, Ser Petracco resettled his family in Carpentras in southern France, where he was associated with the papal court of Clement V in Avignon. In Carpentras, Francesco began his study of grammar and rhetoric with Convevole da Prato and became friends with Guido Sette, a boy his own age whose family had moved to France from Genoa. In 1316, Ser Petracco decided that Petrarch should become a lawyer and sent him to the University of Montpellier. During this period his mother died, and to commemorate the sorrowful occasion Petrarch composed his earliest surviving work, an elegiac poem in thirty-eight Latin hexameters. In 1320, Francesco went, together with his brother and Guido Sette, to Bologna to continue his legal studies, and although he excelled academically, he came to realize that the legal profession was not for him. Nevertheless, the years in Bologna were important in his literary and cultural development, for he befriended a number of other students and became familiar with the Italian lyric tradition. On the death of his father in April 1326, he returned to Avignon.

On Good Friday, 6 April 1327, in the Church of Saint Clare in Avignon, Petrarch first saw and immediately fell in love with the woman whom he would call Laura. This passion would provide inspiration for his poetic imagination for his entire life. Many poems contained in the evolving collection known as the *Rerum vulgarium fragmenta* or *Canzoniere* celebrate his love for her, as well as her symbolic meaning. Her name, Laura—like that of Dante's Beatrice ("one who gives blessedness or salvation")—was significant in that it suggested the evergreen laurel tree, sacred to Apollo, and thus the laurel crown of poetic glory. Throughout the *Canzoniere*, Petrarch engages in elaborate wordplay based on "Laura," using such puns as *l'aura* ("the breeze") and *aureo/a* ("golden") to reiterate her importance.

In 1330, Petrarch and his brother Gherardo had almost dissipated their inheritance. Refusing to follow law or medicine as a profession, Petrarch had to find other employment. Fortunately, he had befriended the bishop of Lombez, Giacomo Colonna, who recommended Petrarch to his brother Cardinal Giovanni Colonna, who in turn offered Petrarch a position as personal chaplain in his household. At Giacomo Colonna's residence in the summer of 1330, Petrarch met and became friends with

two other young men: Lello di Pietro Stefano dei Tosetti from Rome (whom Petrarch nicknamed "Lelius") and Ludwig van Kempen ("Socrates") from Flanders, who served as chanter in Cardinal Colonna's chapel. These and other close friends would be very important to Petrarch throughout the course of his life.

Tomb of Petrarch, Arquà. Photograph courtesy of Christopher Kleinhenz.

As a member of the cardinal's staff, Petrarch was able to travel and meet many people. In 1333, he traveled to Paris and, from there, to Ghent, Liege, Aix-la-Chapelle, Cologne, and Lyon. During these travels he began his lifelong pursuit of manuscripts containing works by classical authors, discovering at Liege, for example, some of Cicero's orations (*Pro Archia*). Also in 1333, in Avignon, Petrarch met the Augustinian monk Dionigi da Borgo San Sepolcro, who introduced him to the works of early Christian writers, especially Saint Augustine, and who gave Petrarch his copy of the *Confessions*. In a letter to Dionigi (*Familiars*, 4.1, dated 26 April 1336), Petrarch gives an account of his and his brother Gherardo's ascent of Mont Ventoux. In it he relates, in thinly veiled allegorical language, how rapidly Gherardo arrives at the summit (signifying the benefits of his monastic vocation) but how difficult his own climb is (signifying the attraction of earthly things). Finally, arriving at the summit and overwhelmed by the majesty of the view, Petrarch opens his copy of Augustine's *Confessions* and reads the

following morally oriented monitory sentence: "And men go about wondering at mountain heights and the mighty waves of the sea and broad flowing streams and the circuit of the sea and the wheeling of the stars: and to themselves they give no heed" (10.8.15). The relevance of these words to Petrarch's own situation and their call to introspection are obvious: it is always more difficult to ascend the steep path to the good than it is to wander around in the valleys looking for an easy route to happiness. This intensely Augustinian moment demonstrates the great influence that the saint had on Petrarch, not only in literature but also in life.

B A S I L E Æ,
PER SEBASTIANVM HENRICPETRÛ

Petrarch, *Opera*. Basilea: Sebastiano Henricpetri. 1581. Reproduced from original held by the Department of Special Collections of University Libraries of Notre Dame.

In January 1335, thanks to a recommendation by Cardinal Colonna, Petrarch was named by Pope Benedict XII to a canonry in the cathedral of Lombez, an appointment that supported him financially but did not require his residence. Sometime before this appointment, Petrarch had written a long letter in Latin verse to Pope Benedict XII encouraging

Benedict to return to Rome. This is the first indication we have of Petrarch's firm belief in the preeminence of Rome as the rightful seat of both the papacy and the empire. Petrarch first journeyed to Rome, as a guest of the Colonna family, late in 1336, and that visit determined his attitude toward the classical past. In a letter to Cardinal Giovanni Colonna, dated 15 March 1337 (*Familiare*s, 2.14), he recounts his first impressions of Rome: "No doubt I have accumulated a lot of matter to write about later, but at present I am so overwhelmed and stunned by the abundant marvels that I shouldn't dare to begin. . . . Rome was greater than I thought, and so are its remains. Now I wonder not that the world was ruled by this city but that the rule came so late." Petrarch's enthusiasm for Rome is complemented by his patriotism for Italy in general; for example, in *canzone* 128 of the *Canzoniere*, *Italia mia, benché 'l parlar sia indarno*, he laments Italy's abject, strife-torn condition; issues a call to arms (verses 93-96); and concludes with an urgent plea for peace, *i' vo gridando: Pace, pace, pace* (verse 122).

Shortly after his return to Avignon in 1337, Petrarch purchased property and a house in Vaucluse along the Sorgue River, and this became his resort of peace and solitude: *transalpina solitudo mea jocundissima* ("My most delightful transalpine solitary refuge"). In this *locus amoenus* he found the time to read, meditate, write, and entertain close friends. Vaucluse represented for Petrarch the Ciceronian ideal of *otium*, the leisure to pursue one's interests without having to attend to the concerns of everyday life. A new acquaintance of his in Vaucluse was Philippe de Cabassoles, bishop of Cavillon, to whom Petrarch would later dedicate his Latin treatise *De vita solitaria* (*On the Solitary Life*).

During this period of medicative leisure, Petrarch began several of his works, some of classical inspiration: the treatise on the lives of famous men, *De viris illustribus*; his epic poem on the deeds of Scipio Africanus, *Africa*; his collection of Italian poems, the *Canzoniere* or *Rerum vulgarium fragments*, and the *Triumph of Love*, the first of the *Trionfi*—six allegorical poems in *terza rima*, based on the descriptions of ancient triumphal pageants. Petrarch would continue to revise most of these works for the rest of his life. The evolution of the *Canzoniere* can be traced through extant manuscripts, some in Petrarch's own hand, that disclose the successive forms of the collection; this would

culminate in the version in the Vatican Library, Codex Lat. 3195. Although he divided his time at Vacluse between Latin and Italian works, Petrarch clearly indicated his preference for the former. On 1 September 1340 he received two invitations to be crowned poet laureate: one letter came from the chancellor of the University of Paris and the other from the Roman senate. Because we know that Petrarch carefully planned the sequence of events leading to these invitations, we can appreciate the coyness with which he reports his careful weighing of these offers, his asking advice from Cardinal Colonna, and his eventual (but foregone) decision to accept the invitation from Rome. Petrarch was familiar with the coronation of poets in antiquity and with a recent revival of that tradition (the coronation of Albertino Mussato in Padua in 1315). This signal honor would, he thought, ensure his fame for posterity and, just as important, reestablish Rome as the locus for culture in the world. To ascertain his worthiness for this honor, he voluntarily underwent a rigorous examination by his sponsor, King Robert of Anjou of Naples. On 8 April 1341, in the palace of the senate on the Capitoline, Petrarch was crowned poet laureate and delivered an oration, in which he spoke of the poet's responsibility and rewards as well as the nature of the poet's profession. The *Coronation Oration* is a wonderful combination of medieval homily and classical rhetoric; in it Petrarch begins with a citation from Virgil's *Georgics* (3.291-292), interrupts it with a recitation of the *Ave Maria*, and then immediately returns to the Virgilian passage. The remainder of the oration contains numerous citations from Virgil, Ovid, Cicero, Horace, and other classical authors. The fame that Petrarch achieved in this single event was immeasurable; indeed, he was now a celebrity, one who was in demand as an honored guest in cities throughout Europe and was cheered wherever he went. This was, in many ways, the beginning of what we might call the cult of personality that Petrarch cultivated and shaped for himself. After leaving Rome, Petrarch spent time in Parma as a guest of the Correggio family and finished a draft of his *Africa*. When he returned to Provence, he began to study Greek with the Calabrian monk Barlaam, but without mastering much beyond a very elementary level.

The year 1343 was important for Petrarch. At the papal court in Avignon, he met Cola di Rienzo, who would later become the Roman

"tribune of the people." In February, Robert of Anjou died. In April, Petrarch's brother Gherardo became a Carthusian monk, and this led Petrarch to reexamine his own life and goals. In 1343, his illegitimate daughter, Francesca, was born. From these troubling events emerged his soul-searching imaginary dialogue with (Saint) Augustine—the *Secretum*—as well as his *Seven Penitential Psalms* and his treatise on the cardinal virtues, the *Rerum memorandarum Libri*. In form and content, the *Secretum* is based on classical and early Christian models, especially Augustine's *Confessions*. Whereas in his work the saint achieves a relative peace, Petrarch is constantly tormented by the unresolved conflict between spiritual aspirations and worldly concerns. Despite the sound Christian advice imparted by the character Augustinus to Franciscus and the insistent call to meditate on death in order to prepare one's soul for the afterlife, Franciscus cannot easily abandon his earthly pursuits, nor does he really wish to. The lack of resolution at the end of the three-day dialogue suggests not so much Petrarch's lack of faith as his very human reluctance to abandon immediate worldly pursuits in favor of distant eternal rewards.

The Triumph of Love. Li Sonetti Canzone e Trivmphi del Petrarca. . . . Venice: Bernardino Stagnino, 1513. Reproduced by courtesy of Department of Special Collections, General Library System, University of Wisconsin-Madison.

During the next few years, Petrarch traveled frequently: to Naples (in 1343), Parma (1344-1345), and Verona (1345). In the Capitular Library in Verona, he found and transcribed the manuscript of Cicero's letters to Atticus, a discovery that encouraged him to begin his own series of letters addressed to classical authors. After returning to Vaucluse in 1346, Petrarch began work on his treatise on the solitary life, *De vita solitaria*, which he subsequently dedicated to Philippe de Cabassoles. In

1347, Petrarch was happy to receive news of a revolution in Rome and the nomination of Cola di Rienzo to the position of tribune (essentially, dictator), for in these events he saw some signs of the old Roman grandeur. In letters to Cola and the Roman people, Petrarch encouraged them in their battle for liberty. However, Cola's excesses and megalomania would gradually undermine his position and destroy Petrarch's faith in him. After imprisonment in Avignon on charges of heresy, Cola returned to Rome as a senator, only to meet his death at the hands of the Roman people in 1354.

In 1347-1348, the time of the black death, Petrarch was in Verona and in Parma, where news of Laura's death (6 April 1348) came to him in a letter from his old friend "Socrates." The date of Laura's death and that of his first meeting with her, exactly twenty-one years before in 1327, would provide the basic chronological structure for a series of "anniversary" poems in the *Canzoniere*. The disastrous effects of the plague, which resulted in the deaths of several friends (e.g., Cardinal Colonna and Franceschino degli Albizzi), led Petrarch to write the *Triumph of Death* (*Triumphus mortis*).

His discovery of Cicero's letters in Verona in 1345 gave Petrarch the idea of collecting his own letters, and by 1350 he was actively engaged in this project, which would lead to the formation of the *Familiares* (twenty-four books), *Seniles* (seventeen books), *Sine nomine* (nineteen letters), and *Epistolae metricae* (three books). For the jubilee year of 1350, Petrarch traveled to Rome, stopping on the way in Florence, where he met Giovanni Boccaccio for the first time. Among Petrarch's many admirers in Florence were Boccaccio, Zanobi da Strada, Francesco Nelli, and Lapo da Castiglionchio. Always searching for manuscripts, Petrarch found in Lapo's library a copy of Quintilian's *Institutes* and some of Cicero's orations. After his Roman pilgrimage, Petrarch spent time in Parma and Padua. The Florentine republic offered him a teaching post at the university there, and the pope summoned him to return to Avignon. In 1351-1352, Petrarch was once again working in Vacluse on *De viris illustribus* and the *Canzoniere*. In 1353, during his last months in Vacluse, Petrarch was involved in an extended and intense debate with one of the pope's doctors over the relative merits of medicine and poetry, and this discussion resulted in the *Invective contra medicum*, in which Petrarch defends the supremacy

of the liberal arts over the lower mechanical arts and praises poetry as the highest form of wisdom.

During 1353-1361, Petrarch lived for the most part in Milan, as a guest of the Visconti family and with the special support of Archbishop Giovanni Visconti. Despite the criticism he received from his friends for living under a despot, Petrarch was pleased with his circumstances, for he was able to do virtually anything he wanted. One project he began there became his longest work, *De remediis utriusque fortune*, a moral treatise in two books, the first dealing with the perils of good fortune and the second with the dangers of its opposite, adverse fortune. The form of *De remediis* is a series of dialogues between personified qualities; for example, in Book I, Joy and Hope—the children of Prosperity—argue against Reason; and in Book II, Reason's opponents are Sorrow and Fear, the offspring of Adversity. It was in Milan that Petrarch met Emperor Charles IV, whom he encouraged to reestablish the empire with Rome as its capital. These dealings with Charles, undertaken on behalf of the Visconti, allowed Petrarch to travel to Basel and Prague. In 1361, the Visconti sent him to Paris, where he delivered an oration, in Latin, in the presence of King John of France and John's court. Petrarch's eight years in Milan marked the longest nearly continuous residency of his life. Moreover, they were productive years, allowing him to complete *De remediis* and to make great progress in his compilation of the *Canzoniere* and the *Familiars*.

After his move to Padua in the summer of 1361, Petrarch received the sad news of the deaths of his illegitimate son Giovanni (who died in the plague in Milan) and of his old friends "Socrates" and Philippe de Vitry. However, he enjoyed frequent correspondence and encounters with Boccaccio, who often supplied him with copies of rare manuscripts (e.g., Augustine's *Expositions on the Psalms*, Varro's *De lingua latina*, the life of Peter Damian). In May 1362, Petrarch had an opportunity to advise Boccaccio, who had been terrified by a visit from a fanatical monk representing the late Pietro Petroni of Siena. Informed that he did not have long to live and that he should renounce the study of poetry, Boccaccio thought first to dispose of all his books, but Petrarch dissuaded him and encouraged him to continue his studies. However, Petrarch said that he would gladly buy Boccaccio's books if Boccaccio had a change of heart. Petrarch's love of books, and his zeal in

collecting them, enabled him to amass what was at the time perhaps the largest private library in Europe. Recognizing the value of his collection, Petrarch reached a formal agreement with the *maggior consiglio* of Venice whereby he would give his library to Venice in exchange for a suitable house there and the assurance that his books would not be dispersed. Petrarch's collection thus formed the basis for the Biblioteca Marciana in Venice. In Venice, Petrarch enjoyed visits from Boccaccio and numerous other friends; he also was gladdened by the birth of his grandchildren (Eletta and Francesco) and saddened by the death of his friends "Laelius" and Francesco Nelli.

Around 1366, Petrarch employed Giovanni Malpaghini as a scribe for the tedious task of copying the *Familiars* and the *Canzoniere*. In 1367, during a journey to Pavia by canal barge, Petrarch was able to respond to accusations lodged against him a year previously by four Aristotelian philosophers (Leonardo Dandolo, Tommaso Talenti, Zaccaria Contarini, and Guido da Bagnolo) who claimed that he was "a good man, but uneducated." In his response, the invective *De sui ipsius et multorum ignorantia* (*On His Own Ignorance and That of Many Others*), Petrarch gives clear evidence of the changeover from the outmoded ideas of scholastic philosophy to the new humanism; in particular, he argues that the source of knowledge lies not in pseudoscientific syllogistic arguments but rather in a profound intuitive awareness of the self.

In 1368, Petrarch, having been given some land near Arquà (some 10 miles, or about 16 kilometers, southwest of Padua)—initiated the construction of a house, which was finished in 1370. Among his possessions were a lute and a painting of the Madonna by Giotto, both of which have disappeared. Failing health prevented him from undertaking some highly desired trips to Rome and Avignon. His last works include a translation into Latin of Boccaccio's story of Griselda (*Decameron*, 10.10) and the *Invective against the Man Who Maligned Italy* (*Invectiva contra eum qui maledixit Italie*). The motivation for the *Invective* was an anonymous letter written by a Frenchman (Jean de Hesdin) that praised the French and spoke ill of Italy. As for the tale of patient Griselda, Petrarch was so taken by its value as a moral example that he wanted to make it available to readers who did not know Italian, and his translation was Chaucer's model for the Clerk's Tale in the *Canterbury Tales*. In his last years, Petrarch went on several

diplomatic missions for Francesco da Carrara; he wrote letters and continued to work on the definitive versions of the *Canzoniere*, *Trionfi*, and *De viris illustribus* as well as on the compilations of his letters. During the night between 18 and 19 July 1374, Petrarch died. He was buried on 24 July in a marble tomb in the parish church at Arquà.

The Vernacular Works

Although the *Letter to Posterity* says virtually nothing about his Italian works, Petrarch obviously considered them of great importance, for he was continuously revising them up to the very end of his life. If what he says in the *Letter to Posterity* is truly indicative of the way he wanted to be remembered, then it is a great irony, for his fame today rests primarily on his Italian poetry, which proved so influential during the Renaissance, particularly in France, Spain, and England. The composition of the *Canzoniere* was attended to with great care: its 366 poems are divided into two major sections—*In vita di madonna Laura* and *In morte di madonna Laura*—beginning with the secular sonnet *Voi ch'ascoltate in rime sparse il suono* ("You who hear the sound in scattered rhymes") and ending with the religious ode to the Virgin *Vergina bella, che di sol vestita* ("Beautiful Virgin, clothed with the sun"). A large variety of subjects and themes—amorous, political, artistic, moral, and religious—are treated; nevertheless, the truly remarkable feature of the collection is Petrarch's obsessive attention to the presentation of his own poetic persona. Many poems in the *Canzoniere* are characterized by stylized, conventional attitudes toward love and by the presentation of a pensive, introspective lover, and these features were imitated widely in the Renaissance. This combination of psychological and poetic conceits would come to constitute what we generally refer to today as Petrarchism. Although Petrarch was not the inventor of the sonnet, he brought it to such perfection that this fourteen-line metrical form has become known as the Petrarchan sonnet. The six allegorical *Triumphs* (*Trionfi*), which relate the progress of the soul in relation to love, chastity, death, fame, time, and eternity, had a major impact on Renaissance literature, art, and pageantry.

The Latin Works

Petrarch's literary production in Latin encompasses a number of major themes that highlight his crucial place in the history of western civilization. On the one hand, his treatises on fortune (*De remediis utriusque fortune*) and on the monastic life (*De otio religioso*) are distinctly medieval in flavor and conception. On the other hand, there is a definite, forward-looking "Renaissance" cast to many of the Latin works. Petrarch consciously attempted to revive classical genres and patterns in the epic poem *Africa* and in the series of famous lives (*De viris illustribus*) and events (*Rerum memorandarum libri*). His treatise on the solitary life, *De vita solitaria*, is a well-reasoned defense of the Ciceronian ideal of studious leisure (*otium*), which he tried to follow in his own life. He took the cue from classical examples in his collections of letters, in his invectives, in his pastoral poems (*Bucolicum carmen*), and in his dialogue with Augustine (*Secretum*).

Phaedrus

The *Phaedrus* is generally placed among the dialogues written in Plato's middle period, perhaps toward its later phase c. 370 B.C., when Plato was sixty. It is, in any case, the product of a man at the peak of his philosophic and literary powers. Since Socrates is ordinarily to be found in the busy streets of Athens, the unusual nature of what follows is suggested by the setting: a warm summer day in the countryside outside the city walls. He has met Phaedrus, a younger friend who is infatuated with fashionable rhetoric and is carrying a copy of a new

speech by Lysias. After the two find a pleasant place in the shade, Phaedrus reads aloud Lysias's contention that a youth ought to have an affair with a man who professes *not* to love him, since lovers are notoriously irrational. Socrates, who is not really impressed, under the influence of local spirits, offers a technically improved version of the same theme; then, becoming more inspired, he delivers a second speech defending the opposite view—that erotic madness may be a great blessing. With these three examples of oratory in view, the second part of the dialogue is devoted to a sober analysis of true and false rhetoric.

The two parts, though quite different in mood and subject, are held together by the notion of "persuasion," a familiar goal in rhetoric and here also bearing a narrower erotic meaning of "seduction" embodied in the subject of the speeches as well as in the efforts of Socrates and Lysias to influence Phaedrus. In the second half of the dialogue, Plato modifies his earlier hostility to rhetoric (e.g., *Gorgias*) because of its indifference to truth. He is now prepared to concede that persuasion is useful so long as philosophy provides direction by furnishing genuine knowledge. The foregoing speeches have illustrated in the person of Socrates what an honest philosophic rhetorician can do by way of dealing with the nonrational aspects of human nature, which in fact play an important role in life.

A major part of the philosophic content of the dialogue is in Socrates's second speech. The fact of its inspiration represents limits to what can be achieved by analytic reason alone. The astonishing paradox that irrationality may be a divine blessing is defensible because reason—symbolized in its vulgar form by the trivially clever Lysias—does not exhaust reality. Socrates's spectacularly poetic style of speaking, moreover, highlights the unusually explicit portrayal of pederastic sexual feeling. Plato's aim is to show that even the overly physical aspects of attachments in contemporary Greece can be interpreted as initial stages in the emergence of philosophic passion, much as rhetoric can be put to philosophic uses. Sexual response to physical beauty is (ultimately) a response to beauty itself. Balancing this emphasis on the powerful emotional component of philosophy is a carefully worked-out formal proof of the soul's immortality based on the principle of self-motion. Analytic reason reemerges again in a definition of dialectic synthesis and analysis in the cooler second portion of the dialogue.

The eloquent description in the *Phaedrus* of divinely inspired love and of the soul's winged flight from the body to higher spheres attracted attention from the later Neoplatonists and again during the Renaissance, when Ficino, in particular, elaborated its religious-mystical aspects.

The Jowett translation is often eloquent, though dated. The Loeb edition of Plato conveniently combines Greek text with translations but is uneven. Penguin translations are relatively recent and readily available.

Philagathus of Cerami

Greek prose in medieval Italy reaches a high point with the sermons of the twelfth-century Siculo-Calabrian monk Philagathus (d. 1154 or later). He is conventionally called "of Cerami," although it is not clear whether the designation *Keramítes* refers to Cerami in Sicily or to some other place, or is instead a classicizing version of the demotic surname *Kerameús* ("Potter"). Until fairly recently, he was known as Theophanes Cerameus, thanks to a misattribution in one branch of a later Byzantine redaction that converted his sermon collection into a homiliary organized according to the liturgical calendar, and his work was at times presented as that of a ninth- or eleventh-century writer into which more recent material had been inserted. In his Italo-Greek manuscripts he is styled "the philosopher" (and therefore is sometimes so identified in library catalogs) and is also often called Philippus (perhaps his baptismal name) rather than Philagathus. Of his approximately ninety surviving sermons, only thirty-eight have a modern critical edition; the remainder either must be read in texts descended from the very defective *editio princeps* of Francesco Scorso (1644) or are still unpublished. Even so, these cultured and rhetorically accomplished productions have earned a considerable reputation for artistic excellence.

To the extent that they can be localized with certainty, Philagathus's early associations are Calabrian. After entering religion at an unidentified church of Saint Andrew, he trained at the Nea Hodegetria monastery near Rossano, later known as the Patir or the Patirion, for whose founder, Bartholomew of Simeri (d. 1130), he gave a commemorative sermon. Philagathus preached in Rossano proper; in Reggio; and in Sicily, at Messina, Taormina, Troina, and especially

Palermo, where at least one of his sermons was delivered before King Roger II in the predecessor of today's cathedral. His sermon in Roger's Palatine Chapel (seemingly after 1140 but sometimes assigned to the chapel's consecration in 1140) contains the earliest extended description of this renowned monument.

Although Philagathus has been called a court preacher, it might be more accurate to call him a preacher whose distinction led to appearances at court. The venues of most of his sermons are not fully known. He was still active during the reign of William I (1154-1166). An allegorical commentary on *the Aethiopica* of Heliodorus (an ancient Greek novel used by Philagathus in at least one sermon), recently thought to be his, has now been shown to be much older. The attributions to him of the anonymous *Life* of Bartholomew of Simeri, of a grammatical textbook now lost, and of a verse introduction to the fables of Symeon Seth (one form of the Greek "mirror of princes" *Stephamtes and Ichneutes*) are all very dubious.

Phocas

The Byzantine emperor Phocas (d. 610, r. 602–610), a minor officer of obscure origins, was propelled into the leadership of a mutiny against the unpopular emperor Maurice. As Constantinople dissolved in factional chaos and Maurice fled, Phocas found himself elevated to the throne. The fleeing Maurice and his sons were captured and executed, but Phocas's position remained insecure, and this led him to devote his energies to purging enemies, hunting down conspiracies, and imposing a general reign of terror. Thus preoccupied, and resisted locally throughout the empire, he was unable to deal with perilous conditions on the frontiers, as the Avars and Slavs renewed their devastation of the Balkans while the king of Persia mounted a relentless campaign of conquest against the empire's eastern territories. Eventually, a rebellion launched from Carthage under the son of its exarch, Heraclius, made its way eastward and reached Constantinople in October 610, whereupon Phocas was deposed and executed.

Only in distant Italy was Phocas regarded positively. Pope Gregory I, who had been on bad terms with Maurice, hailed the usurper's accession in fulsome letters of rejoicing. In response, Phocas showered

Gregory and his successors with honors (among them, the award of Rome's Pantheon to the church). In 608, the exarch of Ravenna, Smaragdus, had a column erected in Phocas's honor in the Roman Forum; it was the last public monument to rise in that decaying locale. The column is still to be seen in the Forum, although Phocas's name was subsequently expunged from the dedicatory inscription.

Photian Schism

The Photian schism of 863-880 was a controversy between the patriarchs of Constantinople and the popes. In this case, the schism was a split caused by organizational differences, not basic disagreements in belief, but it was the most serious to date between what would become the Roman Catholic and Orthodox churches. The papacy's claim to some sort of authority over Constantinople was present in the background, but the immediate causes were a personality conflict and a struggle for religious control of southeastern Europe.

Nicholas I became the pope in Rome and Photius became the patriarch of Constantinople in the same year, 858. Nicholas involved himself in a dispute over irregularities in Photius's appointment by

sending a fact-finding delegation to Constantinople in 861. Although the accounts are contradictory, it is known that the investigators ruled in favor of Photius. Nicholas, however, eventually repudiated their decision. Other matters also entered the conflict. The Byzantines had deprived the papacy of control over the Balkans during the Iconoclastic period. Reviving old claims, Nicholas claimed jurisdiction over Bulgaria, which converted to Christianity at this time.

Before the 1950s, most scholars believed that Photius, backed by the Byzantine government, allied himself with Nicholas's enemies in Italy, including the western emperor Louis II and John, archbishop of Ravenna. Since 1950, many historians—citing newly discovered evidence—have minimized Photius's role in Italy; they believe that Nicholas's problems there were due purely to western politics. In any case, Photius's attempts to undermine Nicholas culminated in a council, held at Constantinople in 867, which deposed the pope. Nicholas died before the news of this deposition reached Rome; and ironically, Photius—having lost political support—was himself deposed that same year.

Tension continued after 867. Photius's replacement proved just as stubborn with regard to Bulgaria. In 877, Photius again became patriarch. Pope John VIII (r. 872-882) was more flexible than the uncompromising Nicholas. At Constantinople in 879-880, papal legates confirmed Photius as patriarch in return for a face-saving agreement on Bulgaria that gave Rome nominal jurisdiction while leaving actual ecclesiastical control to Constantinople. Accounts of a second Photian schism in older histories have now been discredited by scholars.

Physiologus

Physiologus was the early medieval foundation for all later bestiaries. Except for the Bible, it was the most often translated and most widespread book in the medieval world, known in Greek, Latin, Syrian, Ethiopian, German, Arabic, Armenian, Anglo-Saxon, and other languages. *Physiologus*, actually a nickname for the unknown Greek author, came to be widely used as the title of the work, which was written sometime between the second century and the fifth century after Christ, probably at Alexandria. The work was first translated into Latin in the period between the fourth and the sixth centuries. A number of modern translations have been made from manuscripts of *Physiologus* found throughout European collections; and the text has been attributed to several figures, including Epiphanius (c. 315-403), bishop of Salamis, who composed a treatise on gems (*De gemmis*).

Like other well-known authors of antiquity, including Aristotle, Aelian, and Solinus, *Physiologus* was a naturalist, and his sources were often these other naturalists. His words in the hands of many copyists during the Middle Ages came to be conflated with numerous variations including infusions from local traditions, some descriptive of actual animals, others utterly fantastic.

The rich imagery of *Physiologus* served as a literary resource for animals and fantastic beasts in literature, sermons, sculpture, and painting throughout the late Middle Ages. More importantly, *Physiologus* became the literary foundation for all later encyclopedic summaries of *naturalia* and (as noted above) for the specialized texts on animals known as bestiaries. In addition to collecting stories about various animals, *Physiologus* attached symbolic significance to all creatures. Following scriptural advice (Job 12:7) and models provided by the ancient literary traditions of Aesop's *Fables* and Ovid's *Metamorphoses*, the author of *Physiologus* found in each animal a moralizing metaphorical image. According to an apocryphal story, Pope Gelasius I was given a copy c. 496, disagreed with its moralizing content, and put it on a list of banned books. Nevertheless, *Physiologus* increasingly became a vehicle not only for teaching moral behavior but sometimes for imparting medical advice. For example, eating certain

fowl or other animals at specific seasons or for a variety of ailments was considered advisable. Sometimes these remedies were based on inappropriate and inaccurate verbal analogies, such as *urica* (canker-worm) whose bite burns (*urit*), causing one to "make water." *Physiologus* provided much information for Isidore of Seville's *Etymologies*. As White observed, *Physiologus* was written in a time when "people believed that the Universe was governed by a controlling mind and was capable of a rational explanation. They believed that everything meant something. . . . Every possible article in the world, and its name also, concealed a hidden message for the eye of faith" (*The Bestiary* 1960, 244). Therefore, to know those disguised messages was to master the hidden solutions to the mysteries of spiritual and physical ailments and healing.

Among the versions of *Physiologus* that have a common Roman origin are those of Philippe de Thaun, Pierre le Picard, and Guillaume le Clerc of Normandy; the Millstater and Waldensian *Physiologus*; the Provençal excerpts; and the Spanish *Physiologus*. Although there are few references to or acknowledgments of *Physiologus* in thirteenth- and fourteenth-century bestiaries and books on animals, their core content is based on the passages found in this early text.

Piacenza

Piacenza, an ancient city in the Po River valley in the westernmost part of Emilia, was settled as a Roman colony in 218 B.C. during the second Punic war. It was reorganized in 187 B.C. in connection with the establishment of military units whose name—*placentia*—eventually was transferred to the city itself. As a Roman city, Piacenza grew in prosperity. During the period of Roman decline, it was ruled in turn by the Goths, Byzantines, and Lombards. In the late ninth century and the early tenth it was held by various local lords, such as Berengar of Friuli, Lambert, and Hugh of Aries, with at least two disruptions by the Magyars. In the later tenth century, the city was incorporated into the Ottonian feudal regime of northern Italy. Immediate control of the city

had long been vested in the bishops, but their power was increasingly shared with and challenged by the emergence of a growing secular population.

Early urban leadership was dominated by aristocratic families, one of whose members, Count Bishop Dionysius, held the city in defiance of Pope Gregory VII. The aristocratic elements that dominated the city supported imperial rule and the dissenting movement called the Pataria. Growing support of the papal reform program prompted the lower classes of the city to initiate a period of internal strife, which resulted in the expulsion of the nobility and cooperation with Milan and other northern cities in their struggle against the German emperor Henry IV during the ongoing investiture controversy. In 1095, Pope Urban II acknowledged Piacenza's allegiance by making it the site of an important synod directed at church reform and the supporters of Henry IV; this synod brought the first hints of what would soon become Urban's call for the First Crusade. By 1126, a commune had taken shape under the leadership of elected consuls (five in number); it rejected both feudal and episcopal traditions of power and expanded its control over the neighboring countryside. Despite threats and impositions by Frederick I Barbarossa, Piacenza persisted in loyalty to the Lombard League, and its soldiers participated in the emperor's defeat at the battle of Legnano (1176). By the peace of Constance (1183), Piacenza regained its municipal autonomy, and in the ensuing decades it refined its governmental institutions and continued its program of territorial expansion in conflict with its neighbors. Piacenza participated in the Second Lombard League against Emperor Frederick II and suffered punishment after the emperor's victory at Cortenuova (1237). By 1250, however, Piacenza's communal vigor was renewed, with popular risings that led to the creation of the office of *capitano del popolo* and were followed by further movement toward the creation of a *signoria*.

Palazzo del Comune, Piacenza. Photograph courtesy of Christopher Kleinhenz.

Leadership in the city was exercised for some years by the Pallavicino and Landi families. However, after the defeat of Manfred by Charles of Anjou in 1266, Piacenza submitted to his rule, electing him protector of the city and accepting his designee as *podestà*. After ten years of Angevin rule, Ubertino Landi reestablished his control of the city. In 1290, Alberto Scotti was chosen "captain and lord" of the city, an office that became hereditary in 1303, enabling the Scotti family to consolidate its power. The Scotti were able to repel the Ghibellines' efforts—supported by Henry VII of Luxembourg—until 1313, when Galeazzo Visconti seized power and was proclaimed lord (*signore*) in a Ghibelline coup. This coup was reversed in 1322, when forces loyal to the Landi conquered Piacenza, making it a new center of Guelf sentiment. In 1335, Francesco Scotti, attempting to reestablish control of the city with the assistance of the Visconti of Milano, brought about the ultimate introduction of Visconti rule in the person of Azzone Visconti, who was followed in power by Luchino and Giovanni. The succession in 1378 of Gian Galeazzo Visconti initiated a new period of institutional reform and brought a brief relocation of the University of Pavia at Piacenza (1398-1402). Republican rule in the city was reestablished in 1447, on the death of the last Visconti, Filippo Maria; but this movement was quickly suppressed by Francesco Sforza, who was proclaimed lord in 1448.

Among significant medieval monuments in Piacenza is the cathedral, built between 1122 and 1233, though it was extensively restored in the nineteenth century. Its facade was augmented in 1350 by Pietro Vago's atrium, popularly known as *Paradiso*. Another church of the period is Sant'Antonino, the original cathedral (fourth-eleventh centuries); it was rebuilt in 1014, on a Greek-cross plan, with subsequent additions. The church of Sant'Eufemia, built in the eleventh century, has been restored to something of its medieval character and has an interesting twelfth-century facade. The twelfth-century church of Santa Brigida, though much rebuilt later, preserves Gothic elements, including a fine portal. Here, in 1185, the commune ratified the treaty of Constance. The church of San Francesco, begun in 1278, is a fine Lombard-Gothic building, with a handsome facade portal and a well-preserved Gothic interior, with ambulatory and radiating chapels.

The Palazzo Comunale, begun in 1281, is regarded as a masterpiece of civic architecture in the Lombard-Gothic style. The Visconti fortress (*rocca*) was begun by Galeazzo in 1315 and completed fifty years later, but it was heavily altered in the sixteenth century to incorporate it into the massive new Palazzo Farnese—now the civic museum, whose holdings include a famous Etruscan divination tool, the *Fegato di Bronzo* ("bronze liver").

Although Alessio Tramello's masterpiece, the church of La Madonna di Campagna, dates from 1522-1528, it highlights the Piazzale delle Crociate, the site where, according to tradition, Pope Urban II in 1095 preached a preliminary call for the First Crusade at the end of his council in Piacenza.

Pier della Vigna

Pier della Vigna (Petrus de Vineia, c. 1190-1249) was born in Capua of obscure parentage and became a senior bureaucrat and officer of state under Emperor Frederick II. Pier had broad and enduring influence as a master of Latin documentary composition and Latin prose stylistics more generally.

Pier's education included the study of law and rhetoric, the former probably at the University of Bologna, and the latter probably at a notarial school in Capua or Bologna, since Bologna and Capua were centers for this sort of instruction. He entered Frederick's court chancery in the early 1220s, became a high-ranking judge, had major financial responsibilities, and wrote private letters for Frederick that did not go through the chancery. It is thought that his superior skill as a stylist and advocate was immediately recognized and that from the beginning of his lifelong employment in this milieu it fell to him to compose the most important and stylistically taxing documents. By 1243, he was protonotary of the imperial court and logothete—a high official with the functions of chancellor—of the kingdom of Sicily. In 1244, he and his colleague (and fellow Campanian) Thaddeus of Sessa were authorized to decide on all petitions presented to the emperor. Pier was a trusted counselor to Frederick, and Frederick's spokesman in many of the emperor's troubled dealings with the papacy and with the communes of northern Italy. Throughout Frederick's long dispute with Pope Gregory IX, Pier represented the emperor at the papal court and at

the courts of foreign princes; shortly before Pope Innocent IV deposed the emperor in 1245, Pier attempted to intervene on his sovereign's behalf.

That Pier used his position to enrich himself and to advance his family is not surprising. But in this regard he does appear to have been excessively grasping and thus to have made many enemies. For reasons that are unclear, Frederick had him arrested in Cremona early in 1249, and blinded a few months later, probably in the fortress of San Miniato near Pisa. Pier's death not long afterward was believed in some quarters to have been a suicide, a view shared by Dante. Pier is one of the most memorable souls in the *Divine Comedy*, though he is identified only as "the man who held the double key to Frederick's heart" (*Inferno*, 13.58-59). It seems likely, as Stephany (1982) has argued, that the portrayal and punishment of Pier in the *Divine Comedy* were provoked by Dante's literal reading of Pier's widely admired *Eulogy* of Frederick, a composition that may have struck Dante as blasphemous and idolatrous.

One of a pair of busts of bearded males from Fredericks monumental gate at Capua (the gate was demolished in 1557 and the bust is now in the Museo Provinciale Campano) is sometimes considered a portrait of Pier. But it seems unlikely that the Hohenstaufen regime would have knowingly permitted this showpiece of imperial iconography to retain, in close proximity to the image of Frederick himself, the likeness of a man stigmatized in official documents of the early 1250s as *Petrus proditor* ("Pier the traitor"). Pier has also been identified as one of the figures in a portrait (now lost) at the emperor's palace at Naples, which supposedly showed him dispensing justice in Frederick's presence; but this too seems dubious.

Pier was famous in his lifetime as a person of high culture and as an artist in Latin prose. His production as a writer falls into several different categories. His early official letters match the style of the Roman curia at the time, a style characterized by elaborate patterns of verbal, phonic, and rhythmic ornaments and laden with biblical citations, all intended to convey honor and respect for the addressee and a solemn celebration of the status quo. The same verbal musicality and allusive citations of well-known biblical and classical texts are evident in letters of consolation, as well as occasional pieces such as the

famous *Eulogy*, in which messianic proclamations about Frederick are amplified with biblical language. After 1225, when the emperor abandoned his posture of gratitude toward the papacy and began to focus on what he perceived as conflicts of interest between papacy and empire, the rhetoric of Pier's letters shifts, in certain cases, from persuasion rooted in praise and affection for the addressee to persuasion based on the points of contention between the parties. The historical circumstances of controversial events become an integral part of the persuasive strategy. For nearly thirty years, Pier would wage a polemical campaign in defense of Frederick II in an attempt to win the support of prelates and princes throughout Latin Europe. Ultimately, his choice of rhetorical approaches would always depend on his perception of the intended public and the subject matter discussed in the letter.

Although the extent of his personal contribution remains controversial, Pier was at least partly responsible for the drafting of *Liber Augustalis* (1231), the Latin version of Frederick's Constitutions of Melfi, a massive law code asserting the absolute authority of the prince in his kingdom. The language of its *Proemiurn* is richly ornamented and cadenced. Just as the *Eulogy* appropriates biblical language to glorify the emperor and his court, the *Proemium* invokes biblical, patristic, and Aristotelian phrases, as well as classical Roman legal phrases, to suggest the universality of imperial rule.

Collections of Pier's documents, to which were added some of his personal letters and various writings of his correspondents and others, began to be made as early as the 1270s and came to be known as the *Epistole* (*Letters*), *Dictamina* (*Formal Communications*), or *Summa* (*Treatise*) of Pier della Vigna. Circulating in several different redactions, they served into the fifteenth century and beyond as models in rhetorical instruction and were used pragmatically in many chanceries. At least 230 manuscripts are known; their quantity and quality attest to the importance that contemporaries and successive generations attached to these writings. The Florentine Guelf Brunetto Latini, writing several decades after Pier's death, commemorates this imperial official as an exemplary orator, and as such, master of Frederick and of the empire.

Pier's other surviving works and possible works include two Latin poems in rhythmical quatrains whose attribution to Pier, though early,

is not certain: one on the months of the year and their properties, the other a satire on the mendicants. Most of Pier's Latin writings and the Latin texts associated with him still lack modern critical editions.

Pier is also a minor figure in early Italian literature. He was one of the court poets of the Sicilian school and is named in the manuscripts as the author of at least eight pieces. Two *canzoni* and a sonnet (the latter is part of a *tenzone* with Jacopo Mostacci and Giacomo da Lentini) are securely attributed to Pier; a third *canzone* (*Poi tanta caunoscenza*) is less certainly his. The modern editor of the Sicilian school corpus, Panvini (1962/1964, 1994), rejects, on a variety of grounds, Pier's authorship of the remainder.

Pierleoni Family

In the course of the twelfth century, as aristocrats in Latium became more conscious of lineage and family names became more common, a Roman family began to be called Pierleoni, after its most powerful representative, Peter of Leo (Petrus Leonis, d. 1128). The family had existed for at least a century before Peter of Leo's time; its earliest recorded member was the Jewish merchant (*laudabilis negotiator*) Baruch, who translated his name as Benedict when he converted to Christianity c. 1040 (he will be referred to here as Baruch-Benedict). The power of the Pierleoni in Rome peaked between 1060 and 1140, but the family received prestigious papal appointments as late as the *Quattrocento*.

Baruch-Benedict married a Roman aristocrat, thanks to the status his riches gave him. The wealth of the Pierleoni was always proverbial, though they were not major landowners like the "old" Roman families. Trade and presumably money-lending (including lending to the popes) created the family fortune. Because of their traditional association with the papacy, the Pierleoni expanded their fortune through lucrative posts and donations from grateful popes. The Pierleoni were also firm allies of the Norman kings of Sicily, from the days of Pope Gregory VII (d. 1085); Roger II paid lavish sums to the family in exchange for a military alliance, further augmenting its wealth.

Baruch-Benedict inaugurated the Pierleoni policy of close cooperation with the papacy, specifically the reform-minded papacy of Leo IX and Leo's successors. Owing to their association with what emerged as the winning party in the Lateran, the Pierleoni rose to preeminence among Roman families. Alongside the Frangipane, with whom they shared the honors and favors bestowed by the reformed popes (some of whom, like Gregory VI, were possibly Pierleoni themselves), the Pierleoni represented the "new" aristocracy of Rome, which replaced the "old" feudal families (the Crescentii, the Tusculani) as the style of papal government changed. The "new" families did not control the popes or dictate their conduct; rather, they adopted Gregorian ideology and loyally executed the will of the reform-minded popes.

Money and military assistance from the Pierleoni enabled several popes to rule Rome despite local hostility. The original Pierleoni strongholds were in Trastevere, the Jewish and commercial neighborhood which remained marginal in Roman history until after 1000. In the second half of the eleventh century, the Pierleoni extended their control over the Tiber island onto the left bank of the river, where they held the theater of Marcellus (and the nearby church of Saint Nicholas). Having secured this crucial southern crossing of the Tiber in Rome, the Pierleoni wielded great influence in the city. Popes who were denied access to Saint Peter's could reach the basilica by crossing the Tiber at the island and proceeding through Trastevere to the "Leonine city" under the protection of the Pierleoni. By the later eleventh century, the family also controlled Castel Sant'Angelo. All popes until Callistus II (d. 1124) relied on this web of castles cast throughout Rome.

The downfall of the Pierleoni began with the death (in November 1128) of Peter of Leo. He had guided the house successfully for half a century, and he died "peerless" for wealth and progeny (as his epitaph in the cloister of Saint Paul's Outside the Walls declares). His children became involved in a debilitating struggle with the Frangipane family, who had imposed their own candidate as pope in late 1124 and had thus offended the Pierleoni. Seeking to recover prestige and influence with the next pontificate, the Pierleoni had one of their own family—a respected, upstanding cardinal—elected as Anacletus II in February 1130, just as the Frangipane elevated another pope, Innocent II. The Pierleoni seem to have stood for the die-hard Gregorian reformers' party, whereas Innocent II received support from northern Europe and the new monastic orders of the period.

This Anacletan schism of 1130-1138 proved the Pierleoni capable of dominating Rome in the face of the enmity of all Europe, but it ended with the victory of Innocent II and his supporters. The antipope Anacletus, eloquently vilified by the best writers of his day, was the last Pierleoni to have great authority in Rome. Thereafter, the Pierleoni rarely played significant roles in Roman affairs. They remained aloof during the Roman revolt of 1143-1155; and they were soon eclipsed by another generation of "new" lineages (the Orsini, the Savelli).

Like most aristocratic Roman families of medieval origin, the Pierleoni claimed to have origins in antiquity (the Anicii were said to

be relatives). Renaissance genealogists also invented a relationship with the Hapsburgs.

Piero da Firenze

Piero da Firenze (Maestro Piero, first half of the fourteenth century), despite the surname conventionally given to him, does not seem to have come from Florence; rather, he may be identical with a Magister Petrus Andreutii who originated in Assisi and is documented in 1335 in Perugia as a singing teacher hired by its commune. Although Piero was a major figure in the first generation of *Trecento* musicians of the Italian *an nova*, we know almost nothing of his life. However, it is clear that he died just after 1350; and from allusions in his works, it is understood that he was present at the Visconti court of Milan and the Delia Scala court of Verona during the 1340s and was apparently in contact (if not also in friendly competition) with such contemporary masters as Giovanni da Cascia and Jacopo da Bologna. He must have been their senior, though, and a surviving document of his time seems to illustrate him as an old man with a white beard and a monastic tonsure.

Presumably because Piero was not from Florence, his music was not included in the great Squarcialupi Codex. It survives scantily in contemporary manuscripts and consists of only eight secular Italian works: six madrigals, mostly for two voices; and two *cacce*, for three voices, to which might be added two more *cacce* of doubtful attribution. His two authenticated *cacce*—*Con brachi assai* and *Con dolce brama*—are delicious exploitations of double entendres, based respectively on evocations of hunting and sailing. Piero's few extant works are enough to indicate his importance as a trailblazer. He seems to have been particularly partial to canonic writing, and his madrigals and *cacce* are the earliest examples of these forms in which canonic part-writing is developed. In that sense, he was the pioneer in establishing the main musical point of the *caccia*: its imitative "chasing" of voice parts. It is clear that these techniques strongly influenced Jacopo da Bologna and Giovanni da Cascia, and that they served to create a stylistic

momentum which would be carried forward through the continuing Italian *Trecento* tradition.

Pietro Abano

Pietro Abano (Pietro d'Abano, d. 1316) was the most important medical teacher in early fourteenth-century Padua. He was a Lombard by birth, but little is known of his life. In spite of his fame, and the fame he brought his university, he seems never to have accumulated the wealth of such successful teachers and practitioners as Taddeo Alderotti. Pietro's most famous book, *Conciliator of the Differences of the Philosophers and Especially the Physicians*, remained in use in universities well into the early modern period.

Pietro received his medical training at the University of Paris, where he would have been indoctrinated into the highest levels of scholarly debate surrounding the natural philosophy of Aristotle and Aristotle's interpreters. He returned to Italy from Paris c. 1306 to teach medicine, philosophy, and astrology at Padua. The *Conciliator*, which was completed sometime after 1310, shows his Parisian training. The book presents more than 200 disputed questions on the subject of medical philosophy and attempts to reconcile conflicts between the physiological teachings of Aristotle and the medical teachings of Galen. Pietro apparently was deeply impressed by similar attempts by Averroës and Avicenna, who adopted the Neoplatonic scheme of the ultimate reconciliation of conflicting philosophical viewpoints.

Pietro also distinguished himself as one of the early translators of Galen's works from the original Greek into Latin. Much of his writing examines the importance of medical astrology. This interest in astrology, as well as his devotion to Averroist teaching, marred his reputation in some circles.

Pietro Alfonsi

Pietro Alfonsi (Petrus Alfonsi, twelfth century) was a learned Andalusian Jew, originally named Moses, who converted to Christianity. He was baptized in Huesca, in the kingdom of Aragon, on the feast day of Saint Peter in 1106 with Alfonso I serving as his godfather—hence his new name, Pietro Alfonsi.

Little is known of Alfonsi's life. He may have served in the Aragonese court before his baptism. He had an Arabic education in letters, philosophy, and science, and he demonstrates in his writings a fundamental knowledge of the Talmud and the Bible. Between 1106 and 1116, Alfonsi emigrated to England, where he taught astronomy and served Henry I, perhaps as his physician. During that period, he produced a rather inaccurate Latin translation of Arabic astronomical tables. Through his residence abroad and writings, he passed on an intimate knowledge of Arabic culture and learning to Europeans.

Around 1108 or 1110, Alfonsi composed the *Dialogi contra Iudaeos* the most important anti-Jewish polemic of the Middle Ages. His widely circulated *Disciplina clericalis* (of uncertain date) had an important influence on the development of the European narrative tale; echoes are apparent in Petrarch and Boccaccio.

The remarkable *Disciplina* fused scatological stories with didactic form and context. Its generic models were Oriental books of wisdom

and the European "mirror of princes." Alfonsi recounts thirty-four aphoristic stories in the form of short teacher pupil or father-son interchanges intended as a manual of moral education for the cleric. He used a complex tradition of non-Christian sources, drawn, in part, from philosophy and including Arabic proverbs, animal fables, verses, and *exempla*, to illustrate universal truths. The *Disciplina* is general enough to avoid doctrinal pronouncements: it could as easily have been written by a Muslim or Jew as by a Christian. The more scandalous stories serve to entertain but do not detract from the book's didactic purpose. Major themes include moderation; good counsel; the attributes of kings; and injunctions against alcohol, women's wiles, and the vanity of earthly things. Some stories debunk superstitions and belief in magic.

The text's extensive tradition of seventy-six extant manuscripts demonstrates its popularity and its appeal to medieval readers in different cultural contexts. There were numerous translations into the vernacular, including Italian. Thirteenth- and fourteenth-century mendicants mined the *Disciplina* for material to use in sermons, adding Christian morals to the stories. Compilers of later *exempla* collections often included Alfonsi's tales, verbatim or modified. Fourteenth- and fifteenth-century redactions diminished the didacticism, emphasizing instead the entertaining aspects of the narratives.

In Italy, the thirteenth-century compiler of *Il novellino* included Alfonsi's Fables 6 and 12a. *Disciplina* is the best-known Arabic source for Boccaccio's *Decameron*, a strain of influence that awaits thorough study. Boccaccio could have learned these tales from the original Latin, from Italian or French translations, or possibly from an *exempla* collection. He transformed them into modern fiction; he enriched Fable 14 with distinctive personalities for the characters and a more sympathetic portrayal of a wife (*Decameron*, 7.4). Menocal (1987, 140) has suggested a possible pattern in the *Decameron*: the ninth story of each day relates to the Arabic world.

Pietro da Barsegapé

The didactic poet Pietro da Barsegapé (fl. second half of the thirteenth century) was from Lombardy. The name Barsegape derives from *de Basilica Petri*, now Bescapé, a suburb of Milan. Barsegapé wrote a long religious poem referred to in the text as *sermón* or *dito*, *digio* (the last to be pronounced as Spanish *dicho*). *Sermone* is its modern title; its German editor, Keller (1896), called it a *Reimpredigt*. The work has been preserved only in a richly illuminated manuscript from the end of the thirteenth century or the beginning of the fourteenth (iMilan, Brera, or Braidense Library, AD XIII 48) and consists of no fewer than 2,440 lines of different meters—mostly alexandrines and approximate novenaries (the Old Italian rendering of Provençal octosyllables), which are rhymed (occasionally only assonated) in pairs.

In the colophon of the last lines (2431-2440), where Barsegapé declares his name and the date when he finished his poem (1 June 1274), he calls himself a *fantón* ("soldier"), thus lending support to scholars inclined to identify him with the Milanese chieftain to whom (i.e., *nobili et probo vivo domino Petro de Bezacape*) Iacopino Randone, at that time the *podestà* of Florence, addressed a Latin letter on military affairs (31 March 1260).

The thematic range of the *Sermone* stretches from the creation of Adam to the resurrection of Christ, with the customary view to doomsday as a supplement. Barsegapé faithfully follows the narrative of Genesis and the Gospels, opening occasional excursuses—predicatory in tone but not totally deprived of colorful remarks—on the corruption of human society and the greediness of his fellow men. A difficult question is raised by several passages that are closely echoed in the works of earlier or contemporary poets of the same region, as in Pateg's *Splanamento* and especially in Uguccione's *Libro*, whose verses 2180-2201 are also to be read in Barsegapé's *Sermone* (verses 1713-1734). Plagiarism on the part of the author or *contaminatio* on the part of the scribe (particularly in the latter case) may be taken into account, without excluding the possibility of a common vernacular source not available to us.

Barsegapé rarely sounds original or dramatic; hence Contini chose not to include him in the Lombard section of his paradigmatic anthology (*Poeti del Duecento*, 1960, Vol. 1). Nevertheless, because of the linguistic interest aroused by such a long and detailed text in Old Lombard, and because it is the work of a layman rather than a cleric or a grammarian, Barsegapé's *Sermone* remains a notable document of the literary culture of his time.

Pietro dei Faitinelli

Pietro dei Faitinelli (c. 1310 or 1320-1349) was born into a noble Guelf family of Lucca. He married Becchina di Coluccio della Volpe in 1313, and in 1314 he went into exile as a result of political events. After seventeen years of exile he returned to Lucca, where he worked as a notary until his death.

Pietro wrote seventeen sonnets and one *canzone* on political, moral, and comic themes during the first quarter of the fourteenth century. His nine political sonnets are among the most mordant and powerful of his time. Of particular note are those in which he castigates the Guelf army for lacking bravery and conviction on the battlefield: *Poi rotti sète a scoglio presso a riva, Già per minacce guerra non se vénze*, and *Voi gite molto arditi a far la mostra*. Some of his works are of interest for their metrical innovations: a political *tenzone* (*Muggbiando va il leon per la foresta* and *Amico, guarda non sia mal di testa*) in which the proposal sonnet, sixteen lines in length, ends with a rhymed couplet and the response *per le rime* ends with a second *coda*; and a "triple sonnet" of thirty lines (*Io non vo' dir ch'i' non viva turbato*).

Pisa

The city of Pisa was one of Italy's most important economic, religious,

and artistic centers in the Middle Ages. Situated on the Tyrrhenian coast, Pisa was protected by the sea, about 6 miles (about 10 kilometers) from the city's western edge. To the south were the Livorno hills, to the north the Alpi Apuane, and to the northeast the Monti Pisani. Together with the forests that immediately surrounded the city and its *contado*, these mountain ranges insulated Pisa from its adversarial neighbors, especially Lucca. On its eastern side, however, Pisa was more exposed. The Arno connected it to the Valdarno and to the communes further inland. Florence lay only 50 miles (80 kilometers) across this valley, leaving Pisa open to unwanted aggression. Despite this vulnerability, the sea and forests guarded Pisa well. They also offered the commune's economy unbounded resources throughout the Middle Ages.

We know relatively little of ancient and early medieval Pisa. The city was founded by the Romans as an outpost in the imperial period. As a major port, Pisa took in tribute from Rome's subject territories and sent it on to the capital. The city's connection to Rome was further strengthened by two roads: the Via Aurelia, built c. 241 B.C., linked Pisa to Rome; and the Via Emilia, built later, in 109 B.C., as an extension of Via Aurelia, wound its way through Liguria and even farther north. Situated on Rome's principal route to Gaul, Pisa was thus a significant city during the Roman period, as its archaeological remains indicate. Traces of a Roman bath and an amphitheater, a broad collection of sarcophagi, and the rudiments of a road system, all found north of the Arno, suggest that the colony there was well developed and densely settled.

How long the Romans stayed is uncertain. But when the Lombards arrived in Italy in A.D. 568, and afterward made Pavia their capital, Pisa declined in importance. The Lombards came to and dominated Pisa, inhabiting roughly the same area covered by their predecessors. Like the Romans, however, they left little evidence of the duration of their stay. By the ninth century Pisa was free from Lombard rule and accommodated a Christian population. In 814, a baptismal church, a *pieve*, could be found at some distance from the former Roman city. Also in the early ninth century, the Pisans began to form a fleet for defense and for maritime conquests. This strategy paid off: their first naval success against the Saracens in 823 gave the Pisans control of the African coast. Thus the early Middle Ages saw Pisa emerge as a

Christian center, prepared to flex its muscle in order to expand its territory and bring in much-coveted booty. Yet in spite of these early advances, Pisa and its environs remained relatively uncultivated until c. 1000.

In antiquity and in the early Middle Ages, Pisa had been important for its proximity to the sea, but beginning in the eleventh century, it soared as an economic, commercial, and political power. Easy access to the Mediterranean gave Pisan merchants and military forces a lead in their enterprises in the Tyrrhenian Sea and in the east, stimulating precocious and intense economic growth that lasted until the thirteenth century. This growth gave Pisa primacy in Tuscany and prominence among other port cities on the peninsula. Only Genoa and Venice attempted, and eventually managed, to displace Pisa from this position in the later Middle Ages. In addition, natural resources from the Pisan hinterland furnished its merchants and artists with a variety of agricultural products and raw materials, and thereby helped to promote commercial and creative activities during the eleventh and the twelfth centuries. This period of economic prosperity was also important for Pisa's political and ecclesiastical history. The commune gained autonomy from imperial domination, and the church and diocese grew in both size and prestige. All together, these aspects of the city's institutional and economic expansion changed the shape and appearance of the city, as its infrastructure and artistic traditions testify. In the mid-thirteenth century, however, various factors caused all this growth to slow. Changes in the prevailing political and social order, seen most markedly in the rise of the *popolo*, transformed the city. One result of this transformation was a series of struggles between social and familial groups, which in turn opened the commune and church to meddling outsiders. The contest between the Guelfs and Ghibellines also divided the city. Moreover, the very sources of Pisa's economic success turned out to be at least a partial source of its demise. Challenged by other seafaring communes, as well as by those further inland, Pisa found itself constantly under attack in these later years. War and natural disasters also continually depleted Pisa of its human resources. By the end of the fourteenth century, Pisa had entered a long and irreversible economic and political decline.

Duomo, Pisa. Photograph courtesy of Christopher Kleinhenz.

Political and Economic Life

Pisa's political institutions emerge clearly from the sources beginning in the eleventh century. The government first took the form of a consulate c. 1085, the earliest of any Italian city. The consulate consisted of twelve members of the city's most successful maritime families, and it ruled the city throughout the twelfth century. It is mentioned for the last time in 1217. How the consuls were appointed remains unclear, but we do know that their election was subject to the acclamation of a general assembly of citizens. Once formed, the consulate relied on various subgroups to assist it in administering the commune. An elected group of senators—who were, however, not firmly organized into a senate until the late twelfth century—acted with the consuls to steer the commune through war and to decide on methods of taxation. As early as 1164, these senators worked with six representatives from each of the city's newly named *quartieri* (jurisdictional divisions), totaling twenty-four in all, to form an advisory council to the consuls. To be elected to one of these positions, a citizen had to belong to one of the major guilds in the city. *Viscomites*, acting as judges, and *gastaldi*, who for some time headed the city courts, also filled important roles in the consular government. Together, they presided over the city's legal affairs, which

were dealt with directly by imperial judges and a court system dominated by the *curia legis* and *curia usus*, both of which addressed civil cases.

The responsibilities of the consuls and their aides fluctuated with the commune's diplomatic and economic needs. In almost all matters, and especially in directing war, the consuls had to follow the advice of the senators and their council. The council thus checked the decisions made by the consuls, and it did so by vote. In fact, to establish any rules, whether or not these rules were of immediate concern to the consulate, the council had to have the assent of a quorum. Ad hoc commissions were also formed in times of crisis to buttress the support already provided by the *viscomites* and the senators. It appears that the coordination among these groups was intended to maintain some balance of power within the city; their presence did not, however, obviate the need for a *podestà* (podesta, or city magistrate). Pisa's first *podestà* came c. 1190, and podestas continued to hold an important position within Pisan politics until the mid-thirteenth century, that is, for as long as the consulate was in power.

This gradual crystallization of Pisa's internal government in the eleventh and twelfth centuries occurred as the city achieved autonomy from the Holy Roman Empire, which had long exerted its hold over the commune. In 1081, just four years before we see the consulate acting as an independent power, Pisa received the first of three charters liberating it from imperial power. At this time, Emperor Henry IV granted the commune political freedom by relinquishing his jurisdiction over the city and by promising to name no new marquis in Tuscany without the Pisans' consent. The second charter, issued in 1132 by Emperor Lothair II, confirmed the Pisans' possession of lands in the *contado* (countryside). Thirty years later, Frederick I Barbarossa delimited the territories that the commune controlled, exempted the commune from imperial taxation, and confirmed its right to self-government. Such privileges not only ensured Pisa's political autonomy but also enabled economic growth—for with these, the commune could exact tribute from its suburban territories and could impose both direct and indirect taxes on them as it saw fit.

In the eleventh century, however, it was neither the consuls nor their *viscomites* but the archbishop who enjoyed the fullest fiscal rights.

Frederick I granted financial privileges to the *opera del duomo*, which in turn made numerous loans to the commune for public works. These privileges put the archbishop at the center of Pisan political life. As the city expanded in size, absorbing feudatories from the *contado*, consular and archiepiscopal interests came together. These new possessions not only became part of the commune but also belonged to the Pisan diocese, so that inhabitants of newly acquired lands had to swear fidelity to both the consuls and the archbishop. Surprisingly, these overlapping interests resulted in relatively little conflict. The archbishop and consuls combined their strength against external forces and together acquired a mass of new territories to the northeast and to the south of Pisa. By the twelfth century, though, the archbishop virtually disappeared from these acts of submission, indicating that the lines between commune and diocese had become much more distinct.

Foreign relations naturally constituted another critical part of early Pisan political history. In the same years that the commune acquired greater territory, political freedoms, and economic rights, Pisa established itself as a sea power. Its desire to control Sardinia and Corsica, along with other territories, brought the commune into conflict with Muslim and Italian forces throughout the eleventh and twelfth centuries. In 1063, for example, the Pisans cooperated with Norman forces to send a fleet to western Sicily in order to defeat the Muslims in a raid at Palermo. The raid was a success for the Italian forces, and in Pisa the victory was celebrated with the foundation of the cathedral. However, the momentum of this victory was soon countered by local contests with the Genoese over coastal territories. The Pisans and Genoese temporarily overcame their rivalry to make a truce in the 1080s and to join other Italian forces to attack the Muslims in northern Africa. Again, the Pisans and their allies won this battle and divided the territories among themselves. Such attacks on the Muslims were crucial to the Pisans' expansion.

Baptistry, Pisa. Photograph courtesy of Christopher Kleinhenz.

Interest in the east continued throughout the twelfth century, but not without consequences at home. The absence of so many Pisans in Tuscany left the commune open to attack by their neighbors. Genoa frequently took advantage of the Pisans' dispersal by instigating maritime disputes over trade routes and island territories. Another rival, Lucca, also began a series of attacks on Pisa at the end of the eleventh century, striking most forcefully in 1141. The main items of contention between these neighboring communes were control of the Via Francigena (the coastal road connecting France and Rome) and the port of Viareggio. Though tension abated occasionally, Pisa engaged in

war with both Genoa and Lucca intermittently throughout the twelfth and thirteenth centuries. Intracommunal conflict was also generated by the growing conflict between the papacy and the empire. By the mid-twelfth century, Pisa had come to depend on the German emperor's military assistance, and therefore its most vocal inhabitants proclaimed their adherence to the Ghibelline party. This loyalty set Pisa in opposition to nearby Guelf communes, Lucca and Florence foremost among them, involving the Pisans in numerous local wars.

Despite this strife, the eleventh and twelfth centuries were, in general, a time of rapid political and territorial growth for Pisa. This growth, moreover, facilitated a broadening of Pisa's commercial enterprises, for its maritime conquests often led to domination of lucrative trade routes. Throughout the eleventh century and the early twelfth century, Pisans used their military victories to establish colonies in Spain, southern France, Sardinia, and northern Africa. Traders followed suit. By 1177, for instance, the Pisans had a center at Montpellier in France. In addition, the crusades pulled the Pisans eastward, introducing them to trading networks in the Holy Land and along the coasts of Syria, Turkey, and Greece. The Pisans' presence in Egypt came to be especially strong as they set up warehouses in Alexandria and Cairo. They brought to these trading ventures a variety of natural resources, such as timber, iron, leather, wool, and marble; and in return they imported spices, silks, and raw materials. By the mid-twelfth century, then, Pisa had established itself as a major sea power, and through military conquests and commercial exchange had made its presence known throughout the Mediterranean.

During the next century, however, the Pisans shifted the focus of their attention and their resources, and as a result this rapid pace of growth could not be sustained. Indeed, Pisan politics and economic activity underwent a significant shift during the thirteenth century. Whereas the early commune followed an expansionist policy and prospered because of it, the later commune had diplomatic and commercial interests closer to home and concentrated on restructuring the government.

Santa Maria della Spina, Pisa. Photograph courtesy of Christopher Kleinhenz.

In the thirteenth century, the most significant political development was the rise of the *popolo*. This transformed Pisan social life as well as its political and economic institutions. The *popolo* was a collectivity of geographically based armed companies, much of its membership consisting of Pisa's mercantile families and immigrants from other cities and the countryside. Though members of the *popolo* had asserted themselves in government for some time, it was not until 1254 that they successfully established themselves as a political entity. In that year, they took hold of the *signoria*, elected a captain of the people, and created a governing board called the *anziani*. In 1259, they drafted the *Breve pisani popoli* as their constitution. Although the power of the *popolo* was challenged repeatedly by former consuls, it stabilized and maintained its rule until the mid-fourteenth century, when a series of signorial governments took over. One sign of the dominance of the *popolo* was its financial domination of archiepiscopal jurisdictions and the cathedral chapter. Those jurisdictions had formerly been controlled by Pisa's aristocracy, but by 1276 they were managed by the *popolo*. New guilds were also granted political recognition. In the early 1200s, Pisa had two major guilds (*ordines*) and four minor guilds (*artes*); by the close of the century, the number of major guilds had risen to six. Now headed by guild representatives, *anziani*, and a captain, Pisan government in the late thirteenth century looked very different from its

earlier consular counterpart.

The administration of this government relied on an expanded bureaucracy and on a fresh set of law codes. Officials depended on the codes that had been redacted during the consular government in the 1190s but added to them a series of documents drafted in the mid-thirteenth century, including their own constitution. An entirely new set of laws was then compiled in 1287 by the despots Nino Visconti and Ugolino della Gherardesca. The statutes they produced amounted to an up-to-date and comprehensive set of laws that regulated all aspects of life within the commune, from prostitution to public works to rules about citizenship.

Citizenship was indeed among the most important issues included in the code. Requirements for citizenship included paying taxes and making loans to the commune based on a yearly citywide assessment. In addition to financial obligations, there was a residence requirement, although this changed throughout the medieval era. The period of residence was normally twenty-five years but was later reduced to ten, and by 1319 it had fallen to merely three years. Furthermore, during any year one needed to stay in the city for only nine months, as the summer months were considered too humid to require anyone to remain. Once accepted, a citizen enjoyed numerous benefits. Perhaps most significant, one could hold political office; and given the number of civic positions that existed in this period, the chances of obtaining such an office were great. As early as 1162, the "oath of the consuls" specified more than ninety official positions in the commune, ranging from measurers and assayers of currency to chamberlains and custodians of streets and bridges. These kinds of civic employment multiplied as the municipal government grew more complex in the thirteenth century. To be sure, some public offices were more coveted than others. The highest-ranking positions in government, especially those in the *anziani*, were the most desirable. Members of Pisa's leading families from both feudal and mercantile traditions, such as the Lanfranchi, Upezzinghi, Roncioni, Visconti, and Rau, traditionally held these posts. The same families also pushed their members into prestigious positions in the church. In spite of this informal monopoly on public positions, members of lesser families could also contribute to the public life of the commune by assuming one of the numerous civic

roles outlined in the communal laws.

Moreover, the security of many of Pisa's prominent families was often put at risk by their involvement in the ongoing struggle between Guelfs and Ghibellines. Though Pisa was predominantly Ghibelline, its population was split rather evenly over this issue, so that when the Tuscan Guelfs were defeated at the battle of Montaperti in 1260, half of Pisa was invigorated and the other half deflated. Likewise, when Charles of Anjou descended into Italy in 1266 and stabilized the Guelf position in Tuscany, reactions within the city were mixed. And although representatives of both parties inhabited the city, the Ghibellines were nonetheless the most successful in asserting their interests, which kept the commune at odds with the pope. Pisa was put under interdict several times throughout the twelfth and thirteenth centuries. In 1241, for example, Gregory IX excommunicated the Pisans for attacking a team of papal legates en route to a meeting with the emperor. That censure was lifted in 1257, but the Pisans again drew the ire of the papacy by inviting Frederick II's grandson, Conradin, to Italy just as Charles of Anjou was coming there. As a consequence, the Pisans were again excommunicated in 1268, though they were pardoned in 1273.

The effects of this cycle of censure were exacerbated by protracted

personal struggles among Pisa's parties and its *consorterie* (family groups). Dissension and factional violence disrupted communal life continually in the late thirteenth century, ultimately splintering the popular regime and leaving the city vulnerable to intervention by despots. Toward the end of the thirteenth century, signorial governments began to assume control of the city, though usually only for a brief period. Examples of short-lived *signorie* are those of Nino Visconti and Ugolino della Gherardesca (1287-1288), Guy of Montefeltro (1289-1292), and Uguccione della Faggiuola (1314-1316). The year 1316 marked the onset of stronger, longer-lasting *signorie*, as the Donoratico family assumed power and dominated Pisan political life until 1347. Other such governments continued to rule the city, and indeed the *signoria* was the common form of political rule from 1365 to 1402. Pisa lost its independence to Florence in 1406.

In the thirteenth century, we also see a diminution of Pisan sea power. As the popular regime came to political power and stabilized in the mid-thirteenth century, the scope of Pisa's trading narrowed. Pisans were slowly squeezed out of important eastern centers by their stronger rivals, Genoa and Venice, so that by the late thirteenth century the seat of Pisan commercial exchange was directed almost exclusively toward the west. Pisans went regularly to France and Catalonia, attending, for example, the fairs in Champagne. To add to the pressures from other communes that sought to expand their own commercial networks, military losses also forced the Pisans to retreat inland. The battle of Meloria against Genoa in 1284, a battle in which Pisa suffered a devastating defeat, was decisive in this regard. Other, later events were Pisa's loss of Corisca to the Genoese in 1299, and the Aragonese conquest of Sardinia in 1324. This is not to say that Pisa's colonies or commercial ventures at sea were shut down. Because of their proximity to Sardinia and northern Africa, Pisans continued to engage in long-lasting activities with these areas; and until the mid-fourteenth century, Pisa's presence was still felt in Sicily and in the east. But its role was of much less importance, and Pisan merchants had to look elsewhere for sources of capital.

This contraction of Pisa's trading connections over the course of the thirteenth century forced the popular commune to devise new ways of raising revenue. In the late thirteenth century, the government created

new forms of taxation that were based on a rudimentary preexisting system. This earlier system was called into being whenever the city needed financial assistance—that is, essentially in times of war. Fragments of the law code from 1162 indicate that this was essentially a hearth tax. With the exception of the knightly class (whose members were seen as already contributing to the cause) and church lands, all residents were asked for donations, the amount for each household being calculated according to the number of its inhabitants. Though somewhat successful, this *estimo*, or assessment of wealth, had to be expanded in the late twelfth century. The commune and *podestà* continued to rely on citywide support of Pisa's army, but now those with the most wealth were made more responsible for the largest contributions. In spite of this change, the costs of war, urban maintenance, and a more complicated bureaucracy had by the mid-thirteenth century rendered even the expanded system of taxation inadequate. Officials therefore had to invent a more regularized means of direct and indirect taxation. Building on the earlier use of the *estimo*, officials came up with the *libra* to judge who should be subject to the heaviest tax burden. The *libra* taxed urban property according to its estimated value, rather than on the basis of its size or the number of people it supported. This assessment was kept as part of permanent record, so that when the commune needed money, it tallied the amount of money needed and then taxed accordingly.

In addition to the *libra*, the commune also reformed its means of collecting indirect taxes. Up to this point, the commune had permitted its feudal families to oversee such transactions. The Upezzinghi and Donoratico families, for instance, collected tolls over roads and bridges. Under the *popolo*, however, new societies, much like modern customs houses, were established so that tariffs could be used for the commune's benefit. An attempt was also made to expropriate all tolls and tariffs in the Pisan *contado*, and to strip the Pisan archbishop and cathedral chapter of their jurisdictions. The church eventually reversed these measures, but the implementation of both the *libra* and indirect taxation greatly helped to support the costs of maintaining and protecting the commune. Both modes of taxation were kept in place throughout the fourteenth century.

Urban Structure and Development

The shape and structures of medieval Pisa—and indeed modern Pisa—were largely determined by the demographic, economic, and political developments that occurred in the eleventh and twelfth centuries. The Roman and early medieval *civitas* formed a rectangle that extended north of the Arno. But as the city began to prosper in the tenth and eleventh centuries, it consistently attracted waves of settlers. By 1150, for example, Pisa's inhabitants totaled between 11,000 and 15,000. These numbers could not be accommodated by the early medieval city. Pisa's population now spilled out into the *contado*, and especially into the area that would become the city's southern half, Kinsica. Thus in 1156 the consuls decided to enlarge the city by constructing a new wall to include Kinsica and areas to the east and west of the earlier city. When it was finally finished in the early fourteenth century, the new wall followed a path that enclosed 185 hectares (nearly 460 acres)—approximately six times the size of the early medieval city. It not only relieved overcrowding by absorbing Kinsica's population and incorporating new territory into the city but also, in so doing, amplified Pisa's tax base: by integrating this fast-growing population into the city, Pisa's consuls increased the number of taxpayers. Related to this was the consuls' decision to redefine the juridical organization of Pisa's population in 1164, shortly after the wall was begun. Previously classified by their relationship to the gates of the city, Pisa's inhabitants were now slotted into four new areas of jurisdiction, called *quartieri*. These *quartieri*—Kinsica, Foriporta, Mezzo, and Ponte—still serve as the city's organizational base.

Perhaps because of Pisa's prosperity, these new zones filled quickly, and with the new population the face of the city changed. Throughout the twelfth century and the early thirteenth, lay and ecclesiastical groups initiated a spate of building projects. Kinsica in particular saw a boom in the foundation of ecclesiastical and secular establishments, such as churches, canonries, and hospitals. These institutions responded to the needs of the increasing population and at the same time attracted further settlement. At the end of the thirteenth century, the city had about 2.5 times the population it had a century before—that is, about 35,000-40,000 people. This increase in the number of inhabitants and

institutions did not occur evenly, however. Space on both sides of the Arno and along the city's older thoroughfares was by far the most popular. In fact, the congestion around these areas soon came to be considered a public hazard. In their thirteenth-century statutes, municipal officials demanded that the streets running parallel to the river's banks be kept clear at all times.

Heavy traffic through the city also necessitated the construction of additional bridges across the Arno. The city's oldest bridge, the Ponte Vecchio, originally built of wood, was rebuilt in stone in 1046 and remained the principal mode of crossing the Arno until it was destroyed in 1328. The bridge was maintained by a *pontonarius*, and it was covered by shops, as is the Ponte Vecchio in Florence. Pisa's second bridge, the Ponte Nuovo, was built by a consortium of four families in 1183. In 1262, construction on Pisa's third bridge, the Ponte della Spina, began.

As with the expansion of the city itself, the multiplication of the city's bridges reflected the demands of a growing population. Furthermore, the maintenance of these bridges and other public works required a vast number of officials. Yet during the twelfth and thirteenth centuries, the functioning of so many offices seems to have fragmented the administration of public works and made it less efficient. In the second half of the thirteenth century, Pisa, like many other communes, decided to join its offices of public works into one centralized bureau. This process was not completed, however, until the mid-1300s.

Ecclesiastical Institutions and Religious Life

The history of the Pisan church and of Pisan religious life follows a pattern similar to that of the commune's political and economic institutions. In the late eleventh century and the twelfth century, as Pisan political institutions became stronger and the commune's economic base expanded, the Pisan church also rose in importance. In the thirteenth century, when the status of Pisa's government and economy changed and the stability of each was uncertain, the church weathered a series of challenges and controversies that forced it to

redefine itself.

As the commune gained increasing autonomy from the Holy Roman Empire with the bestowal of imperial privileges in the late eleventh century and the twelfth, the Pisan church also gained greater power. Most important, in 1092, Pope Urban II elevated the Pisan church to an archbishopric, its archbishop, Daimbert, having won the favor of the papacy. With this distinction came an expansion of the Pisan diocese. It was given metropolitan jurisdiction over Corsica, an honor extended in the twelfth century to include Sardinia. Also in the 1090s, the role of the Pisan church within the city changed. New religious orders entered the city and came to challenge the hold that the archbishop and cathedral canons had on the pastoral care of urban dwellers. This partitioning of the *cura animarum* ("cure of souls") first began in 1090, when the Camaldolesi entered the city. Soon after their arrival, other newcomers followed, so that by the mid-twelfth century various centers of pastoral care had formed: the Camaldolesi were found in San Michele in Borgo, San Erediano, and San Zeno, all located on the north side of the city; the Vallambrosans at San Paolo a Ripa d'Arno in Kinsica; and the Augustinian canons at San Martino, also in Kinsica. For the cathedral and its canons, this meant a gradual diminution of their influence. Though the cathedral was reassured of its exclusive right to baptize and to administer extreme unction, its right to burial was eventually cut back and confined to its original domain, that is, the area of the early medieval *civitas*.

This reconfiguration of pastoral administration resulted in ongoing struggles between the new and older institutions. As a result, when more newcomers tried to insert themselves into the institutional framework of the church during the 1200s, neither the cathedral canons nor the relatively new members of the city's pastoral system welcomed them. The most important of these newcomers were the mendicant orders. The Dominicans first arrived in the city in the 1220s, with the Franciscans trailing close behind. As was common in many Italian cities, both sets of friars were met with suspicion by the Pisan archbishop and clergy. The cathedral canons in particular resisted the attempt by the Dominican order to establish its convent as a center of pastoral care, principally because the Dominicans' church was so close to the cathedral.

By contrast, later archbishops encouraged the activities of the mendicants. Archbishop Federigo Visconti (r. 1254–1277) saw the friars as allies in his larger effort to unite his people and to reform his church. He sponsored their work, helped to refurbish their churches, and urged his lay listeners to do the same. Visconti's support of the friars' activities and his sympathy toward their spirituality ensured their enduring presence in the city; and with the continued reinforcement of Visconti's successors, the friars permanently shaped the nature of Pisan spirituality. The legacy of this environment included two fourteenth-century preachers, Giordano da Pisa and Domenico Cavalca, both of whom spent time in the urban Dominican convent of Santa Caterina. At the close of the thirteenth century, then, the activities and members of the Pisan church were much more diverse than they had been in the 1100s.

As important as this diversification was, the Pisan church should not be understood solely in terms of spirituality and pastoral care. As one of Pisa's wealthiest landowners, the church continually defended, leased out, and attempted to consolidate its patrimony, which was spread throughout the city and province. One archbishop, Ruggieri Ubaldini (r. 1279-1295) made the church's holdings his special concern. The church was also deeply involved in the politics of the day, and in particular acted as an intermediary between the notoriously Ghibelline commune and the papal see. Archbishop Visconti himself tried to restore peace to this troubled relationship, although with limited success, as the commune was put under interdict three times during his career alone. His successors faced similar challenges, and some failed miserably to uphold the name of the institution. Oddone de Sala (1313-1323) had a singularly shaky career, which included a period of exile. The precariousness of de Sala's career rendered all of Pisa vulnerable to the aggression of Lewis of Bavaria, who seized and ruled Pisa from 1327 to 1329. But once he was ousted, the Pisan church was restored to order under Archbishop Simone Saltarelli, who governed until 1342.

Although church leaders were embroiled in the commune's political troubles, the inhabitants of Pisa nonetheless had a vital spiritual life through a variety of religious institutions. The twelfth and thirteenth centuries saw an increase in the number of religious foundations such as hospitals and confraternities. These foundations not only provided an

outlet for new developments in lay religious life but in so doing further diversified the Pisan religious landscape. Pisa's local saints and the cult of the Virgin also became important popular civic institutions. There was considerable enthusiasm throughout Pisa for the city's patron saint, Ranierus (d. 1160), and his compatriots, Bona, Ubaldesca, and Domenico Vernagalli, all of whom, according to their *vitae*, took on the plight of the poor as their central concern. Somewhat later, the *beate* Gherardesca (b. 1230) and Chiara Gambacorta (b. 1362) practiced a less socially oriented asceticism, choosing to lead more solitary lives. It was not so much these local figures, however, as the Virgin who served as the focal point of Pisan religion. The Pisans dedicated the cathedral to her as their protectress, after a military victory in 1063, and they put her effigy above each of the city's gates. In addition, to celebrate the feast of her Assumption the commune prepared for weeks beforehand. These festivities included ceremonies honoring the Virgin and convoluted processions through the city that incorporated residents of both Pisa and the *contado*, thereby unifying two parts of the Pisan commune and diocese.

Art and Architecture

Few Italian *piazze* attract the attention commanded by Pisa's Piazza del Duomo, now also called the Campo dei Miracoli. The cathedral complex, in the northwest corner of the walled city, occupies the original site of the early medieval *pieve*. Three of its monuments—the cathedral, baptistery, and *campanile*—are all models of a unique style of architecture, Pisan Romanesque, which became one of the most influential architectural styles in Italy during the medieval period. With the exception of its cemetery, the Camposanto, the monuments in this complex were begun during the eleventh and twelfth centuries, at the height of Pisa's military and economic strength.

The *duomo* of Pisa (as noted above) was founded in 1063 in celebration of a victory at sea against the Muslims, and it was consecrated by Gelasius II in 1118. The cruciform basilica was designed by the architect Buschetto. The nave, 312 feet (about 95 meters) in length, is framed by double aisles and ends in a wide transept and

apsidal choir. The polychromatic marble exterior is of great importance for both its coloring and its composition—particularly for its use of arches and arcades, which came to serve as a model adopted by craftsmen all over Italy. The facade has three stories, and on the ground level there are three bronze doors carved by Bonanno. Classical inscriptions also decorate the facade, but more important than their decorative effect is that these allusions underscore the idea of Pisa as a new Rome, a strong current in Pisan literary and religious circles in the twelfth century.

To the east and west of the cathedral, respectively, stand the *campanile* and the baptistery. Both monuments embody the Pisan style, as they make use of arcades and thin columns to lighten the appearance of their marble surfaces. The circular baptistery was begun in 1153. Construction was interrupted several times, and the baptistery was not completed until the early fourteenth century; however, the core of the baptistery must have been essentially finished by 1246, for it was then that the font was installed. On the other side of the cathedral is the *campanile*, a cylindrical clock tower (this is the famous "leaning tower"). It was begun in 1173 and, like the cathedral, was founded to mark a sea victory; and as with the rest of the monuments in the *piazza*, its construction was slow, continuing intermittently throughout the following two centuries. In its various phases, the construction was overseen by Giovanni di Simone, the main architect of the Camposanto (c. 1275); and by Tommaso di Pisano (active there in 1350-1372).

The fourth element of the cathedral complex is the Camposanto, the enclosed burial ground north of the cathedral and baptistery. The Camposanto was begun in 1277 by archbishop Visconti and became a popular site for members of Pisa's elite families. Its name (meaning "holy field") derives from a story that it holds earth brought back from the Holy Land in 1203. The design and decoration of the cemetery were the work of Giovanni di Simone. Protected by walls of solid white marble, the interior of the Camposanto is filled with Roman sepulchres that were reused by Pisan families and leaders. Frescoes, although now for the most part lost, also covered the walls of the interior. Their subjects include the *Triumph of Death*, *Legends of the Anchorites*, *Last Judgment*, and *Life of Saint Ranierus*. Though these murals were badly damaged by bombing during World War II, the preliminary sketches

(*sinopie*) still exist. The attribution of the frescoes has been widely debated, but many, which date from mid-fourteenth century, are now commonly ascribed to Buffalmacco.

The visual power of this *piazza* has often been said to derive from the stylistic uniformity of the monuments and their spatial relationship. The *duomo*, baptistery, and *campanile* all share the features that came to be characteristic of the Pisan Romanesque: gray-and-white striped revetment, arcades on the ground level, slender columns, upper galleries, and classicizing architectural details. Even the Camposanto, despite its relative simplicity and its later inception, fits into this group. Furthermore, the juxtaposition of the monuments appears to have been carefully orchestrated from the outset. Yet contrary to what this harmonious effect might lead us to believe, the present appearance of the *piazza* was not achieved until the sixteenth century; during the medieval period, other edifices filled the *piazza*. On the north side stands the bishop's palace, and on the south side is the Spedale Nuovo, a redbrick hospital founded in 1257. There were also hospices for men and women, private residences, a house for lay brothers and for the *operarius* of the cathedral, and olive and peach trees. Finally, before the Camposanto was built, Roman sarcophagi were dispersed around the church; and Pisans often chose this area as a burial place. Thus in the Middle Ages the *piazza* functioned not just as a stage for religious ceremonies but as a home for pilgrims and the sick, and as a final resting place for the Pisan dead.

As monumentally important as this square was, it did not monopolize artistic activity in Pisa during these centuries. Other churches throughout the city and *contado* are also noteworthy. The oratory of Santa Maria della Spina, built in 1323, is most akin stylistically to the monuments at the Piazza del Duomo. Its single space is encased in walls of white-and-gray marble which are decorated with sculptures and jewel-like details similar to those seen on the baptistery. The small church got its name because it supposedly housed a thorn (*spina*) from Christ's crown. Originally the church sat on the bank of the Arno, but it was moved to its present position—just above the river—in 1871 for fear of flooding.

Another important church, San Piero a Grado, is a few miles outside the city. According to its foundation legend, when Saint Peter came to

Italy he first set foot in Grado, and he erected an altar on the site. The church was built around that altar. In the Middle Ages, its fame attracted scores of pilgrims from Pisa and from much farther away. Inside, the basilica has a double apse and is decorated by frescoes of the lives of saints Peter and Paul dating from the late thirteenth century.

The interiors of many of Pisa's churches were embellished by Pisan and Tuscan sculptors and painters, among them Nicola and Giovanni Pisano. The Pisanos executed two pulpits in Pisa: one for the baptistery, the other for the cathedral. Nicola Pisano crafted his pulpit for the baptistery c. 1260. This hexagonal pulpit is decorated with scenes from the life of Christ that are characterized by classical forms; like the inscriptions on the face of the cathedral, these forms connect the work to the popular theme of Pisa as a new Rome. In this project, Nicola had two assistants—Arnolfo di Cambio and Fra Guglielmo da Pisa—who went on to fulfill commissions of their own in Orvieto, Viterbo, Rome, and Pistoia, spreading his influence as they went. Later, from 1302 to 1310, Nicola's son Giovanni made the pulpit for the cathedral. In form, Giovanni's pulpit is circular, and as a result it seems less vertical than the earlier piece. It is richly detailed and is the largest of the four pulpits done by this father-son team. Like his father's, Giovanni's pulpit also depended on a large team of assistants for its completion. Perhaps most important among them was Giovanni di Simone, who, as we have noted, became the chief architect of the Camposanto. Before working on the pulpit, the younger Pisano busied himself with another pulpit in Pistoia and other pieces for Pisan churches. For example, he completed an ivory *Madonna and Child* for a tabernacle inside the *duomo* c. 1299.

Andrea Pisano, originally from the Pisan village of Pontedera, and his son, Nino, further strengthened the association between Pisa and the plastic arts. Andrea served as *capomaestro* at Orvieto until 1349, but he is better known for the set of bronze doors that he carved for the baptistery in Florence. These doors occupied him from 1330 to 1336. Covered with scenes of the life of John the Baptist, they show the influence of Bonnano's doors for the cathedral of Pisa, in that Andrea adopted Bonnano's use of rectangular fields. Despite Andrea's provenance, the sculptural style of the reliefs takes little from his predecessors, Nicola and Giovanni Pisano. Andrea's son Nino, on the other hand, carried on Andrea's work directly, albeit briefly—Nino died

by 1368. Nino was an active silversmith in Pisa c. 1358-1359 and carved various pieces for the interiors of Pisa's churches.

Pisan painters, though overshadowed by Pisan sculptors, did produce important works in their own right. In the first half of the thirteenth century, Giunta Pisano painted several crucifixes that seem to have influenced Cimabue. Another native, Francesco Traini, who was active as early as 1320, came to be an important fresco painter in Tuscany.

The history of Pisan secular art and architecture is less prominent, because far fewer examples survive. The central civic buildings of the medieval commune—a *signoria* and a praetor's palace—were razed and replaced by Giorgio Vasari in the sixteenth century when he remodeled the Piazza dei Cavalieri. A few civic constructions do remain, however, to attest to the growth and success of Pisa's government and its mercantile families. For instance, in the Piazza dei Cavalieri, a pair of thirteenth-century towers, one of which held the imprisoned Ugolino (made famous by Dante for his treachery during the battle of Meloria in 1284), still stand in the main *piazza* beside newer structures. Along the edges of the Arno, and along the city's main thoroughfares, especially Via Santa Maria and Via del Giglio, the facades of private palaces provide excellent examples of Gothic domestic architecture.

In the latter half of the fourteenth century, an impoverished economy and, as a result, a decline in commissions brought Pisan artistic and architectural production to an abrupt end. Chaos within the Pisan church, the principal patron of the artists, made Pisa no place to live, let alone work. Indeed the political and economic decline that began in the thirteenth century, together with the problems suffered by the church, brought the efforts of public builders and local artists to a definitive end in the early fifteenth century. Pisa was taken by the Florentines in 1406, and in spite of a few short-lived periods of independence brought about by the Pisans' rebellion, the commune lost its autonomy permanently in 1509. Annexed to the Florentine republic, Pisa attracted some architectural and cultural innovation during the first half of the sixteenth century. But nothing could restore the energy and prosperity that had characterized Pisa during the height of its power in the eleventh, twelfth, and early thirteenth centuries.

Pisano, Andrea

Andrea Pisano (Andrea di Ugolino di Nino da Pontedera, c. 1295-c. 1348 or 1349) is recorded as a sculptor, goldsmith, and *capomaestro* (master of works) of the cathedrals of Florence and Orvieto. Andrea was the son of a notary and is presumed to have been born in Pontedera, near Pisa. His reputation rests principally on his designs for the doors of the Baptistry in Florence (signed and dated 1330), which are considered among the greatest achievements of Tuscan *Trecento* sculpture. In this project, Andrea demonstrated that the direct narrative style and effective compositional principles of Giotto's painting could be successfully translated into the art of relief sculpture.

Though nothing is known for certain about Andrea's formative years, it is thought that he trained as a goldsmith, since the reliefs for the bronze doors, his earliest securely documented commission, exhibit attention to miniature detail and ornament as well as a high degree of competence in working with metal. Given the characteristics of his

securely identifiable oeuvre, it comes as no surprise that Andrea was referred to as *orefice* (goldsmith) in 1335.

Andrea's Reliefs for the Baptistry, Florence (1330-1336)

In 1322, the Arte di Calimala (guild of importers and exporters of cloth) of Florence, the institution in charge of the decorative program of the Baptistry, had made plans for wooden doors covered with gilded metal. By 1329, the project had been revised, and the officials of the Calimala favored a more costly and technically more challenging option: doors in solid bronze. Andrea is first recorded in connection with this project in 1330, but his appointment almost certainly dates from 1329, when the Calimala sent a Florentine goldsmith to Pisa and Venice, which had a tradition of bronze casting, to examine examples of bronze doors. Though Andrea's reliefs carry the date 1330, his work did not end until late 1335: in 1330-1331 he worked on the wax models, which were cast in bronze by Venetian craftsmen in the *cire perdue* method; in 1333 the left door valve was installed; and the right wing was not completed until late 1335, owing to problems in the casting. The doors were dedicated on the feast of John the Baptist (the patron saint of the building and of Florence) in 1336; they originally adorned the east portal but were subsequently removed to the south portal to make way for Lorenzo Ghiberti's work.

Each wing comprises ten reliefs on the life of John the Baptist and four reliefs of virtues; all are set in quatrefoil frames that are, in turn, contained in rectangular fields. The general configuration of Andrea's doors was inspired by the Romanesque scheme of Bonanno's Porta San Ranieri at the cathedral in Pisa and, possibly, the Porta Regia (now destroyed) from the same building. The remarkable unity of Andrea's design, however, depends on a variety of decorative motifs, which include lions' heads that are placed at the corners of each panel, bands of studs and rosettes that unite the lions' heads, and dentiled moldings that frame each of the quatrefoils.

The iconographic program of the figural reliefs is closely related to the mosaic scenes of the life of John the Baptist in the interior of the Baptistry and to frescoes on the same theme by Giotto in the Peruzzi

Chapel in Santa Croce (also in Florence). Giotto's influence is also reflected in the harmonious balance of the compositions, in which reliefs are carefully structured into planes; and in the classical economy of the narratives, which rely on the purposeful movements of concentrated groups of figures. The technique of applying figures to a plain background, a feature of Sienese metalwork of the early *Trecento*, adds to the solemnity of the compositions. Concessions were, however, made for the occasional motif of a doorway, curtain, or canopy; and in five reliefs from the left door valve, landscape is incorporated into the designs with great subtlety. The influence of Giotto's measured style in Andrea's work is tempered by a debt to French and Sienese artistic traditions: activated, spirited drapery forms, which envelope the bodies of Andrea's dignified figures, introduce a note of grace and elegance to the otherwise restrained reliefs.

Andrea Pisano, *Virtue of Hope (Spes)*. Detail of south door of Baptistery, Florence. Photograph courtesy of Christopher Kleinhenz.

That Andrea was at the height of his creative powers when he worked on the doors is clear from the precision of the finely chased details of the fire-gilt surfaces. The Calimala had, evidently, awarded this difficult commission to a mature and proficient artist, and his work would remain a benchmark for artistic excellence into the *Quattrocento*. In fact, when the Calimala set up a competition in 1400-1401, the aim

was to attract an artist who could work on a second set of bronze doors that would follow Andrea's model and maintain his high standards.

Andrea as *Capomaestro* at Florence and Orvieto (1337-1348)

Andrea's contribution to the decoration of the *campanile* in Florence probably dates from before Giotto's death in 1337. Thereafter, Andrea succeeded Giotto as *capomaestro*, supervising work on the tower until 1341. He proceeded according to his great predecessor's plans for the lower part of the structure, which included two rows of reliefs: the lower group, within hexagonal frames, shows scenes from Genesis and practitioners of the arts, sciences, and works of man; the upper set shows the seven sacraments, the seven planets, the seven virtues, and the seven liberal arts in rhomboid frames. However, Andrea departed from Giotto's scheme in adding niches designed to include statuary above these relief cycles. Though the precise nature of Andrea's contribution is still a matter of scholarly debate, one work generally attributed to him is the marble relief *Sculpture*, which, like the style of the bronze reliefs, is characterized by plastic form, harmonious composition, and attention to detail.

Around 1341, Andrea returned to Pisa, where he maintained a workshop even after 1347, the year he was appointed *capomaestro* at the cathedral of Orvieto. By 1349, however, Andrea had been replaced, and it is frequently assumed either that he died of the plague in 1348 or 1349 or, less probably, that he moved to Florence. The family tradition was carried on by Andrea's sons Nino (fl. 1334–1360s) and Tommaso (fl. 1363-1372), especially Nino, who succeeded his father at Orvieto. Andrea's sons were less interested in the classicizing aspects of his work, and both of them evolved a mainly Gothic formal vocabulary. In the early *Quattrocento* the suave, lyrical style of their sculpture was still a force to reckon with, as the early work of Jacopo della Quercia demonstrates.

Pisano, Giovanni

Giovanni Pisano (d. by 1319) was the son of Nicola Pisano. Nicola executed the pulpits in the baptistery of Pisa and the cathedral of Siena,

and Giovanni is first documented as an assistant to his father in the contract of 1265 for the pulpit in Siena; Giovanni received periodic payments until October 1268, when the pulpit was completed (Bacci 1926; Carli 1943; Milanese 1854). Nothing certain is known of Giovanni's activities between 1268 and 1278, when his name appears together with Nicola's on the Fontana Maggiore in Perugia. From c. 1285 to c. 1297, Giovanni was at work in Siena, where he is mentioned as *capomaestro* of the project for the cathedral facade in 1290. His name is recorded in Siena in 1314, but in 1319 he is referred to as having died. There is considerable uncertainty regarding the attribution of his early work or supposed early work on the pulpit in Siena, and elsewhere; passages that convey a greater degree of "spiritual tension" have tended to be ascribed to him, whereas those characterized by greater emotional restraint have suggested the hand of Nicola. One image on the Fontana Maggiore is almost certainly by Giovanni; a pair of eagles with enormous claws, powerful breasts, and twisting bodies that seem to anticipate the griffin on the central support of the pulpit in Pistoia.

The facade of the cathedral in Siena was left incomplete on Giovanni's departure c. 1297, and scholars disagree as to whether the present facade reflects his original plan (Kosegarten 1984) or the upper section is a much later design, c. 1370 (Carii 1977; Keller 1937). The program in Siena (unlike the encyclopedic programs of French Gothic cathedrals) is strictly Mariological, and the coherence of its iconography is strong argument for assigning the conception of the entire facade to a single initial project. From early sources we know that a (lost) Madonna and Child stood in the lunette of the central portal flanked by a representative of the commune swearing an oath of allegiance on behalf of Siena, and by a personification of Siena holding up a model of the cathedral. Scenes from the lives of Joachim and Anna and from Mary's childhood adorned the lintel of the central portal; the side lunettes and the gable fields contained mosaics representing further events from Mary's life. On platforms projecting from the towers and between the lunettes of the lower facade were placed prophets and kings of the Old Testament and sibyls and pagan philosophers, i.e., those who in remote times had foreseen the miraculous birth of the savior. Spread out along the upper facade were evangelists and apostles, whose teachings are confirmed by the prophets. Though these were

executed in the fourteenth century, they too were probably part of the original plan, which envisioned the prophets standing like foundations for the New Testament figures above. Around the rose window appeared a seated Madonna and Child flanked by half figures representing the genealogy of Christ; scenes from the life of David, an ancestor of Christ, appeared on one of the tendril columns that originally flanked the portals. The pictorial program of the facade thus revealed the place of Siena within the total redemptive plan of Christian theology. The initial visual impact of the facade comes from an interplay of its chromatic, plastic, and structural effects: the contrasts of color, light, and shadow created by the deep jambs, gables, and gallery; the rich tactile plasticity and rhythmic flow of concave-convex movements across the lower horizontal band of portals and lunettes; and the stepping back of the upper facade behind the gables. The fourteen prophets and sibyls (the originals are in the Museo dell'Opera del Duomo) are dynamic, plastic forms whose gestures and movements embody the excitement of their special enlightenment. The dramatic effect of these figures communicating across real space has no medieval or antique precedent. However, the facade abounds in classicizing motifs such as bead and reel patterns, dentils, masks, acanthus foliage, and *all'antica* "peopled columns" originally flanking the main portal (Seidel 1968-1969, 1975; Venturi 1927). The traceried *bifore* and *trifore* and aspects of the figure style are influenced by French precedents, whereas the alternation of dark and light marble revetment belongs to the Tuscan Romanesque tradition. The facade, then, shows a creative synthesis of antique traditions, local traditions, and northern Gothic influences—the last of these seen also in the undermining of solid surface in favor of perforated mass.

Giovanni Pisano (1248-C.1314), pulpit, Sant'Andrea, Pistoia. Photo: © Scala/Art Resource, N.Y.

Perhaps as a result of professional difficulties, Giovanni left Siena c. 1297, when the facade was still incomplete (Ayrton 1969). Around this time, or possibly earlier, he executed a number of sculptures for the exterior of the baptistery in Pisa. The remaining fragments (installed in the Museo dell'Opera del Duomo in Pisa) are badly weathered, but these swelling, twisting figures burst with inner energy.

Around 1297, Giovanni received his first commission for a pulpit, from the parish of Sant'Andrea in Pistoia. Pistoia was unusually rich in

Romanesque monumental sculptured pulpits, and the proposal for Sant'Andrea insisted that it must not be inferior to one made for San Giovanni Fuorcivitas by Guglielmo, a student of Nicola Pisano; this suggests that there was a strong sense of rivalry among churches. Giovanni's pulpit is signed and dated 1301 and has an inscription that boasts of a "mastery greater than any seen before" (Pope-Hennessy 1972). This richly carved and elegant structure—its parapet poised on Gothic trefoil arches above slender columns with alternating animal and figural supports—reveals Giovanni's debt to Nicola's two earlier pulpits, but it also reveals that Giovanni was completely independent in terms of technique, composition, and expressiveness. Like Nicola's pulpit in the baptistery in Pisa, Giovanni's pulpit in Pistoia is hexagonal and has great structural clarity. But here Giovanni adopts an invention from his father's pulpit in Siena: the narrative reliefs are flanked by figures. All the forms—capitals, figures, narratives—are more energetic than the corresponding elements in Nicola's pulpits. In particular, the lion, griffin, and eagle of the central support are dynamic opposing forces, revolving around the column as hub. Traces of polychromy on the figures as well as remains of the glazed colored background *tesserae* give a hint of the original chromatic effect. The most stunning aspect of this pulpit, however, is the heightened emotional content of the narratives. In the Annunciation, for instance, the awesome message simultaneously thrusts the Virgin away from Gabriel and magnetically draws the figures together. Expressiveness combines with naturalism to bring the sacred figures down to earth: the Christ child in the Nativity is neither the miniature adult of medieval tradition nor the Herculean child rendered by Nicola but is arguably the first realistic newborn infant in the history of art (Moskowitz 2001). Giovanni's compositional and expressive powers are nowhere more evident than in the Massacre of the Innocents. At first the composition appears chaotic, but closer examination reveals that the violent movements, deep pockets of shadow, and flashing highlights cohere as a series of zigzag vertical and horizontal rhythms generated by the forward motion and gesture of King Herod. In a cinematic sequence, every moment of response is portrayed: to the left of Herod, three women plead before the brutal slaughter; immediately below and at the lower left, several mothers clutch their infants in terror, shielding the babies with their own bodies;

at the base, three grieving mothers bend over their dead children. Finally, bringing the eye upward toward Herod again, mother and murderer—like an angel and devil fighting for a soul in the Last Judgment—battle over the body of a screaming infant who has already received the death blow.

A quieter, more intimate side of Giovanni's artistic personality is revealed in a series of depictions of the Madonna and child executed throughout his career. In Giovanni's hands, the image is transformed from austerity and rigidity to an expression of intimacy, as can be seen in a half-length Madonna from a tympanum of the *duomo* in Pisa of the mid-1270s (Keller 1942, 13). In several later Madonnas, the child leans toward his mother, resting his arm on her shoulder. Finally, in the Prato Madonna, universally attributed to Giovanni (c. 1312), the relationship intensifies, as Mary, smiling, bends her head down to direct her gaze at her son. In contrast to the regular, planar features of Giovanni's figure on the tympanum in Pisa, the Prato Madonna is characterized by refined features and delicate transitions in the soft planes and contours.

Giovanni's mastery extended to wood and ivory. He executed a beautiful ivory Madonna and child (Ragghianti 1954; Seidel 1972, 1991) and a series of wood and ivory crucifixes—none documented or dated—which are so compellingly close to his images on the pulpits that the attributions seem valid (Seidel 1971). These, too, mark a turning point in the history of the theme in Italy: the relative quietude of Nicola's representations is now often replaced by an aching pathos reminiscent of some transalpine examples.

In 1302, Giovanni was commissioned to execute a pulpit for the grand Tuscan Romanesque cathedral of Pisa. Because of its location within the vast space of the *duomo*—beneath the cupola, near the south transept—it had to be much larger than the pulpit in Pistoia. Like Nicola's pulpit in Siena, it is octagonal rather than hexagonal. Since each parapet of the bridge leading from stairway to balustrade contains a narrative, there are nine relief fields (an unprecedented number), with the first and last narratives (those on the bridge) on flat panels and the rest on curved slabs. This expanded sequence includes scenes from the life of John the Baptist: the first relief shows the Annunciation to Mary, Mary and Elizabeth in the Visitation, and the Nativity of John the Baptist. Parallels and intersections between the life of Christ and that of

John, his precursor, were emphasized in the popular apocryphal literature of this period; and here they are made eloquently clear because the two Nativity scenes are at an angle to each other and thus can be seen simultaneously.

An inscription on the pulpit alludes, in a surprisingly self-conscious way, to difficulties: "The more I have achieved the more hostile injuries have I experienced" (Pope-Hennessy 1972). Further along, there is a reference to the "envy" of others and the "sorrow" of the sculptor who lacks adequate "recognition." Vasari was quite critical of this pulpit, and later in the sixteenth century, when an excuse presented itself, the monument was dismantled (Bacci 1926; Moore et al. 1993). After various proposals for reconstruction in the late nineteenth century, the present version was executed by Peleo Bacci in 1926. Responses continue to be mixed. Documents record the names of dozens of individuals engaged on this pulpit, and certainly the quality of the carving is not as uniform as that on the pulpit in Pistoia. Nevertheless, there are passages of unsurpassed emotional power and inventiveness, such as a saint dragging a resurrected soul toward Christ; moreover, many of the reliefs reveal a continuing engagement with issues of spatial illusionism and naturalism in the treatment of figures and landscape.

Giovanni Pisano, pulpit, *Nativity and Annunciation of the Shepherds*. Duomo,

Both artist and patron must have felt the challenge posed by the three earlier pulpits and must have sought to surpass them in size, iconographic and sculptural complexity, and decorative richness. The pulpit in Pisa is, then, a recapitulation, synthesis, and amplification not only of the three others but also of the major innovations in almost all the earlier monuments by Giovanni and his father. In addition to the animals and figures supporting the columns—a feature of the earlier pulpits—here there are unusually complex figural supports: in the center the three theological virtues, supported by personifications of the eight liberal arts; *Ecclesia* supported by the cardinal virtues; statue columns of Saint Michael and Hercules (or Samson); and finally a statue column of Christ supported by the evangelists. Not only do the curved narrative panels boldly flout visual expectations; below the parapet, where in earlier works we would see roundheaded or pointed trefoil arcades, we now find, supporting the spandrel reliefs, exuberant classical volutes that seem to anticipate the Baroque and are impossible to enclose within the regular geometric contours of architectural norms. Here, as in the convex reliefs above, Giovanni must have relished his radical departure from the expected. In its sheer inventiveness of form, and in the range of emotions and the effectiveness of gestures in the narratives, the pulpit in Pisa represents a tremendous intellectual and artistic achievement.

The last major work by Giovanni is the tomb of Margaret of Luxembourg, wife of Emperor Henry VII. After her death in 1310, a cult grew up around her remains; and reports of miracles led to her beatification in 1313, when the tomb was probably commissioned (Seidel 1987). Much of the original complex is lost, but a major element is extant: an exceptionally fine carving of the empress being raised heavenward by two angels. There is scholarly debate as to whether the group represents the *elevatio animae*, the soul elevated to heaven, fervently desired in the prayers for the dead; or the bodily resurrection, which should occur only at the last judgment but might be granted earlier to a saint. The visual evidence suggests a bodily resurrection, since Margaret is sufficiently weighty to require the physical exertion of the two angels. Also disputed is whether the tomb was a wall

monument or, like many later saints' shrines, freestanding (Pope-Hennessy 1987; Seidel 1987).

Pisano, Nicola

Nicola Pisano (c. 1220-1278 or 1284) is generally assumed to have come from southern Italy and thus from the cultural milieu of Emperor Frederick II von Hohenstaufen. Nicola may have arrived in Tuscany as early as c. 1245; a series of carvings in the upper reaches of the cathedral of Siena have been plausibly attributed to him (Bagnoli 1981).

In 1260, Nicola signed and dated the pulpit in the baptistery of Pisa. This pulpit has an unprecedented form; it is a hexagonal freestanding structure whose shape was eminently suited to the centralized plan of the baptistery and echoed Guido da Como's octagonal font occupying the center of the interior space. Its parapet and platform are sustained by seven columns; the central column is surrounded by crouching

figures and animals, and the six outer columns alternately rest on lions and on the ground. The columns support trilobed archivolts flanked by representations of the virtues and John the Baptist. Above these rises a balustrade with historiated relief fields separated by triple colonettes. When the pulpit was in its original state, the creamy marble reliefs framed by reddish colonettes and moldings, the speckled and patterned supporting columns, the relief backgrounds filled with colored glazed tesserae (some of which remain), and the polychromy accenting some parts of the figures produced a richly chromatic effect.

The reliefs embellish five of the six sides (the sixth is the entrance to the platform) with scenes from the life of Christ. In a continuous narrative, the first panel shows the *Annunciation*, *Nativity*, *Bathing of the Christ Child*, and *Annunciation to the Shepherds*. This is followed by panels illustrating the *Adoration of the Magi*, *Presentation in the Temple*, *Crucifixion*, and *Last Judgment*. The figures are powerfully plastic and expressive and reveal the sculptor's study of ancient art and northern Gothic art, enabling him to combine the serene majesty of the former with the deeply felt human experience of the latter. Nicola was not content to present symbolic narratives of transcendental events; his goal was, rather, to tell a human story in a credible and empathic manner. The work is enriched by naturalistic details; the figures convey a sense of bulk and weight, and gestures and movements are rendered with convincing naturalism. This new mode of sculpture was the visual counterpart of the widely diffused apocryphal literature, in which the sparse accounts of the Gospels were enriched with domestic incidents, making the sacred figures human.

In 1265, Nicola signed a contract for a second pulpit, in this case for the cathedral of Siena. Several assistants, including Amolfo di Cambio and Nicola's son Giovanni, are named in the contract. This pulpit, completed in 1268 and placed within the enormous space of the *duomo*, is octagonal and is larger and more complex than the one in the baptistery in Pisa. Here, the narrative program began at the stairway bridge leading to the pulpit casket, with a figure of Gabriel (now in Berlin) corresponding to Mary of the *Annunciation* seen at the left edge of the first relief (Seidel 1970). As at Pisa, there are three tiers—supporting columns, arcade, and parapet. The central support includes figures representing, for the first time, the liberal arts. The narratives

now include the emotionally wrenching *Massacre of the Innocents* and a *Last Judgment* that spreads over two fields, with a full-length figure of Christ the judge between the reliefs. Furthermore, instead of column clusters (as at Pisa), there are corner figures framing the reliefs, resulting in a continuous visual and narrative flow. The classicizing forms of the earlier pulpit give way to more elegantly proportioned figures with softer draperies and refined features—an ideal influenced by French Gothic art. In the narratives, the figures are smaller and more densely packed, and the compositions are organized to suggest movement into depth. Furthermore, Nicola has greatly enlarged his emotional range. The crucified Christ in Siena, for instance, conveys a pathos lacking in the earlier relief: hanging with arms stretched in two great diagonals, shoulders dislocated, abdomen sunken by the weight of the upper torso, and head bent into the chest, the figure conveys human pain and tragedy, intensifying the meaning of the crucifixion.

In 1267, Nicola completed the *Area di San Domenico* (tomb of Saint Dominic) in the church of San Domenico in Bologna. The form and structure of the *area* became the prototype for an entire class of tombs through the fifteenth century (Moskowitz 1994). Many changes have been made to this tomb, but originally it consisted of a freestanding sarcophagus resting atop a series of supporting statue columns representing friars, archangels, and virtues. The sarcophagus, the only part of the original monument that is still in San Domenico, is embellished on all sides with an extensive cycle of biographical reliefs rather than the traditional biblical or symbolic themes. The relief backgrounds show patterns of red and gold *verre églomisé* (much of it restored). The narrative fields are separated by full-length figures projecting in high relief, including the Madonna and child on one long side, the Redeemer on the other long side, and the four church fathers—Augustine, Ambrose, Jerome, and Gregory—at the corners of the sarcophagus. The corner figures, both on and supporting the sarcophagus, project out diagonally, encouraging the observer to move around the ensemble.

The bold and original design of the *area* has sources as disparate as pulpits, bishops' thrones, holy water fonts, and ancient sarcophagi and was conceived as addressing both laypeople and the Dominican hierarchy. "When the tomb was in its original location between the

presbytery and south aisle, Dominic's most public and most spectacular miracles were on the side facing the lay congregation, thus serving to promote the cult; and the scenes of the founding and expansion of the Dominican order, which were of greater interest to the clergy, were on the side facing the choir area.

Nicola Pisano (c. 1220-1287), pulpit. Baptistery, Pisa. Photo: © Scala/Art Resource, N.Y.

The last major work securely associated with Nicola's name is the Fontana Maggiore ("great fountain") in Perugia, completed in 1278. This is a remarkable secular and civic monument, as original in form and

conception among fountains as Nicola's pulpits and the *area* are, respectively, among pulpits and tombs. The Fontana Maggiore is polygonal and embellished with sculptures; it stands in Perugia's main civic and religious square, and it began not as an artistic project but rather as an engineering and hydraulic problem: it was intended to bring an adequate water supply to Perugia, a town poor in freshwater springs (Nicco Fasola 1951). Precedents for some elements of the fountain's formal structure are found in two- and three-basin liturgical furnishings, such as baptismal and cloister fountains; and also in illustrations of the *fons vitae*, copies of the Holy Tomb, pulpits, and altar *ciboria* (Hoffmann-Curtis 1968; Schulze 1994). However, there is no close prototype for the scale, the complexity of design, or the richness of the program of this indispensably functional urban monument. The sculpture on the basins is uniquely expansive, including scenes from Genesis, prophets, saints, "labors of the months," the liberal arts, various fables, allegorical figures, and even contemporary civic personages. A ring of steps serves as a foundation; on this rests a twenty-five-sided basin with low reliefs separated by colonettes. Above this rises a smaller basin of twelve plain concave sides with figures at the angles and at the center of each face. From here a thick bronze column emerges supporting a third, still smaller basin, also of bronze, which in turn contains three graceful bronze female caryatids. The facets of the superimposed lower basins do not line up, resulting in a syncopated rhythm that impels the viewer to move around the structure. Simultaneously, the vertical elements, together with the diminishing sizes of the basins and the increasing plasticity of the sculpture, draw the eye upward. The effect is of a spiral movement that culminates in, and is resolved by, the caryatid group. The fountain was designed to be seen not only from the ground but also from the balcony of the communal palace (altered at a later date), which was used for announcements to the *piazza* below and as an entrance to the audience hall within for government officials and citizens. Even today, the view from above has its own special effect, as the play of descending water contrasts with the ascending concentric superimposed basins.

Nicola's sculpture provided the source and impetus for the development of his two major assistants. His son Giovanni took up the emotional current of Nicola's style, transforming it into a very personal and highly charged idiom. Arnolfo di Cambio's temperament led him instead toward a starkly monumental and classicizing mode. Nicola's art profoundly influenced not only his immediate successors but also the painting of Giotto and, indeed, the entire naturalistic and classicizing tradition of the art of the following centuries.

Pisano, Nino

The Tuscan sculptor Nino Pisano (c. 1315-1368) remains an elusive figure for art historians, despite the wide recognition of his importance in the second half of the fourteenth century. He signed only three marble sculptures: in Florence, the Madonna and Child at Santa Maria Novella; in Venice, the Cornaro Madonna and Child at Santi Giovanni e Paolo; and in Sardinia, the Bishop Saint at San Francesco in Oristano. Archival documents record other projects, including a position as *capomaestro* of the cathedral at Orvieto in 1349; contracts for work as a goldsmith; and contracts for tomb monuments, such as those for Archbishop Giovanni Scherlatti of Pisa and for the merchant Giovanni dell'Agnello—his last documented work (1368). The first edition of Giorgio Vasari's biographies of artists, in 1550, mentions only Nino's completion of the Madonna in Santa Maria Novella; but in his edition of 1568, Vasari added three more works from Pisa: the Madonna and Child at Santa Maria della Spina, the Madonna del Latte (Museum of San Matteo), and an Annunciation group at Santa Caterina. The Santa Maria Novella Madonna and Child, in Carrara marble, demonstrates why Nino's sensitive work enthralled contemporary and later sculptors. The elegantly draped Madonna supports a large, animated Christ child on her left hip and smiles kindly as he reaches, open-mouthed, toward a bird that she grasps in her right hand. Nino signed this piece and identified himself as the son of Master Andrea of Pisa. (Andrea created the first bronze doors for the baptistery in Florence and major marble sculpture for the cathedral bell tower.)

Modern scholars have struggled to identify other work by Nino, a task made particularly problematic by his close association with his father; by his independent interest in increasingly expressive Sienese and French Gothic styles; and by the fact that he had his own workshop, which included both his brother Tommaso and his son Andrea di Nino. The attribution of several works—primarily the famous Madonna del Latte, an unusual half-length nursing figure—has been particularly vexing. Although Vasari considered the Madonna del Latte a work by Nino, scholars now generally attribute it to Andrea; even Pope-Hennessy (1994) finally came to this conclusion. Another attribution by Vasari has been equally disputed: the marble Annunciation at Santa Caterina. In this sculpture, the archangel Gabriel and the Madonna may have been moved from their original location,

and the inscription with the date 1370 may have been added later. Moskowitz (1986) does not consider the Annunciation Nino's work; but other scholars accept Vasari's claim and have used this sculpture pair as a basis for attributing to Nino the famous Madonna and Child in Santissima Annunziata in Trapani, Sicily.

Moskowitz (1986) has argued for a limited group of sculptures by Nino whereas Kreytenberg (1984, 2000, 2002) has expanded the corpus and has included wooden sculptures. One of the most interesting works is a rare wooden tabernacle, presumably by Sienese carvers, with a small polychromed wooden Christ crucified that Kreytenberg believes is Nino's and a painted representation of the Virgin Mary, Saint John the Evangelist, and two angels by the Sienese artist Luca di Tommè. Kreytenberg compares this Christ crucified with another work he attributes to Nino, a marble Christ crucified (c. 1355–1360) in Pisa at San Michele in Borgo.

Almost the entire literature on Nino Pisano focuses on questions of connoisseurship rather than the context of his work, which often seems to have been within the orbit of the mendicant orders. The lively interest in this late medieval sculptor, however, has brought increased attention to a very active area of art commissions, often ignored until recently.

Pistoia

Pistoia is a Tuscan city, about 21 miles (34 kilometers) from Florence and 10 miles (13 kilometers) from Prato. It is situated on the Ombrone River, in a basin circled by the Apennines to the north and the Tuscan hills to the south. The province of which Pistoia is the capital extends into the mountains and out to the plain toward Prato. At its farthest extent, medieval Pistoia covered a territory of which almost half was very mountainous and only about a fifth consisted of arable plains and low hills. The city at the center of this region, Pistoia, supplied agricultural products and other trade goods to the mountainous Apennine settlements, which could grow some grains but was better able to grow chestnuts, acorns, and other nuts. People living at the highest elevations, more than about 2,000 feet (600 meters) above sea level, had to buy or trade for wine and oil. Thus Pistoia was important as an agricultural center.

Though horses and cattle wintered in the mountains, sheep herding was possible in the mountain regions only through transhumance, moving the animals from summer to winter quarters at lower altitudes, either near the city of Pistoia itself or across the Arno into the Sienese Maremma. The mountains were also rich in lumber, stone, and iron, which the city used in building. Though the pistol that gave Pistoia its

name is beyond the dates of this work, ironworks of all kinds were a documented specialty of Pistoia from the twelfth century on. Monte Albano sloped more gently, and subsistence farming of grain, olives, and grapes was possible there. Enough wine was produced for export, not just to Pistoia but also to Prato and Florence.

By the twelfth century, Pistoia was a walled city, a regional trade and ecclesiastical center with six major roads leading out of it, and a hub for numerous monasteries. Three routes went over the Apennines: one northwest to Modena and two to Bologna. The first of the two to Bologna went straight north through Sambucca; the other went northeast along the River Bisenzio. The older of two routes heading south over Monte Albano led to Pescia and Lucca, along the Roman Via Cassia; the newer one went to Pisa. The sixth road led east to Prato and then southeast to Florence. In addition, the Via Francigena, the pilgrim route from France through Lombardy to Rome, skirted Pistoia. So long as land travel remained the chief method of transporting goods, Pistoia flourished. However, the Arno was not navigable for large ships much inland from Pisa. As the sea became more important than roads for international trade in the later Middle Ages, Pistoia's importance lessened.

History

There are traces of Etruscan settlement in the vicinity, but the first written reference to the city's classical Latin name, Pistoria, is in Plautus, who speaks of its bakers, *pistorienses*, c. 200 B.C. According to Livy (*Historiae* 39.1), it was the supply base for Roman legions fighting in the vicinity from 279 to 174 B.C. It also saw fighting under the Republic. Catiline's forces were destroyed, and he himself was slain near Pistoria in 62 B.C.

Much of our knowledge of Pistoia in the early Middle Ages is ecclesiastical. Tradition, perhaps unreliable, ascribes its conversion to Saint Romulus, bishop of Fiesole. Tradition also ascribes the dedication of the cathedral to Saint Zeno, patron and bishop of Florence, who saved Pistoia from a flood c. 500. The earliest firm evidence of a bishopric is a mention in a letter of Pope Gelasius I in 496; the first

bishop whose name has come down to us is Johannes, c. 700. In the seventh century, the city, including its cathedral, was destroyed by the Lombards, but the Lombard king Desiderius fortified Pistoia again in 772. The boundaries and possessions are listed in a charter of Emperor Otto III in 998 and were confirmed and further defined by various twelfth-century popes. In 1067, Bishop Leo of Pistoia figured prominently in the investiture controversy between Emperor Henry IV and the church.

Pistoia was the first city to establish its independence after the death of Countess Matilda of Tuscany (in 1115), and the twelfth century witnessed the ascendancy of a commune. There are mentions of statutes as early as 1107, and there are surviving statutes from 1175, which define its powers. But the landowning and property-owning families did not always work peacefully together.

Pistoia was officially Ghibelline, supporting Emperor Frederick II. But c. 1300 the Guelf Cancellieri and Ghibelline Pancia tichi families began to struggle with each other for supremacy. In May 1301, the Ghibelline faction appealed to Florence for help. The combined Ghibelline and Florentine force was victorious, and the Pistoian Guelfs took refuge in Florence. In November, however, the Pistoian and Florentine Guelfs, under Charles of Valois, captured the city. Between 1302 and 1306, the city was besieged. From 1306 to 1310, the city was

ruled by Lucca and Florence and was heavily taxed. The Cancellieri triumphed but then became divided into Black and White factions; the divided town fell to Castruccio Castracane of Lucca, who was its effectual ruler from 1320 to 1328. In 1325, the city appealed to Florence for help, which came at the price of Florentine rule. Under this rule a consular government was established, headed by officials who were first called consuls and then *gonfalonieri*; it lasted from 1329 to 1821.

Political Institutions

The church. The bishopric had been the central force in Pistoia during the early Middle Ages. But in 1048, the cathedral suffered a disastrous fire. Matilda, Countess of Tuscany, contributed to its rebuilding; however, a document of 1114, in which Count Guido and Countess Emilia gave orders to construct a water channel for the building works, indicates that it was not finished until the early twelfth century. By then, the political power of the church in Pistoia was weakening, and its property was being sold to the commune, which was becoming more influential. There are records of regional groups of landowners from the late tenth century. A free commune of lay landholders is first mentioned in Pistoia in 1105. By the statutes of 1107

—the oldest in Tuscany—the commune ruled the city and the land for 4 miles (about 6 kilometers) around it. Though the bishopric continued to hold land in much of the countryside beyond that, neither Bishop Hildebrand (c. 1107) nor his successor Jacobus (r. 1118–1141) was sufficiently forceful to combat the growing organized lay power.

Bishop Atto (r. 1135–1153) succeeded in restoring the church to something of its former importance and regained some of its property. Through a Pistoian cleric called Rainerius, who had become the schoolmaster at Santiago da Compostela, the cathedral negotiated successfully with the archbishop and canons of Compostela for a relic of Saint James, which arrived c. 1140. By 1145, there was an altar to James in the cathedral, and miracles began to be reported. Aided by an indulgence from Pope Eugenius III, Pistoia became a place of regional pilgrimage. The Opera di San Jacopo, which collected and distributed alms and organized the celebration for the feast of Saint James (25 July), had its own *palazzo* in the cathedral square. Some of the miracles reported in Pistoia were included in the widely circulated *Legenda aurea* (*Golden Legend*, c. 1265) of Jacobus da Voragine, bishop of Genoa, spreading the renown of the city. Bishop Atto was also regarded locally as a saint (though he was not formally canonized until the sixteenth century), and miracles reported at his shrine enhanced Pistoia as a spiritual force. One of Atto's successors, Giovanni Vivenzi (c. 1370), was spiritually remarkable enough to be raised to the rank of venerable, but by the end of the twelfth century the bishopric was no longer a political force to be reckoned with.

Commune. From the mid-twelfth century on, the basis of political power was increasingly centered in the commune. By the late 1170s, the commune controlled not only the city but three hospitals guarding the two mountain passes over the Apennines and the pass over Monte Albano to Pisa. By 1200, it also controlled the lowland route to Bologna. This gave it power over most of the trade coming in and out of Pistoia, and over the landholders along those routes, who were taxed in money and services for the maintenance of the roads.

Church and state shared the Piazza del Duomo in the city center, where the episcopal palace was first built in the eleventh century; this palace now houses the archaeological and diocesan museum. The Palazzo del Commune was built in 1294 on the east side of the square; it

now houses the Museo Civico. The Palazzo Pretorio was built in 1367, when the city was under the domination of Florence; the arms of the city magnates still adorn the walls of the courtyard.

Social and Economic Life

The trade routes running through Pistoia ensured its prosperity during the early medieval period. What we know of its social and economic life is scattered before the early thirteenth century but suggests an expanding rural population, capable of supporting monasteries and hospitals. The *Liber focorum* (*Book of Hearths*), which surveyed the rural households of the 124 communes, indicates a prosperous and stable country population, served by thirty-two parish churches (*pievi*) in the province c. 1244. But a decline was setting in: only 108 communes were reported in 1255. The decline seems to have continued through the fourteenth century. The black death hit the region in 1348, and the rural population suffered further losses.

Herlihy (1967, 73) estimates the urban population at about 11,000 in 1219. It remained steady until the political upheavals of the early fourteenth century, when unstable conditions and high taxes drove many people away. There was a plague in 1340; and then, in 1348 (as noted above), came the black death, cutting the population nearly in half. The result was a lack of tradesmen, craftsmen, and laborers in the city at mid-century. But recovery followed; there was more church building in the second half of the fourteenth century than there had been since the twelfth century, the population grew to about 8,000 by 1400, and there were steady increases in wages for both rural and urban workers. The population also expanded outside the city walls.

The chief industries in the city were ironwork and wool, which continued to prosper. Political subjugation to Florence had economic advantages. As early as 1209, Pistoian bankers were present at the fairs in Champagne. Following land routes or using ships from Pisa, merchants also traveled to Marseilles and beyond. They formed merchant companies, of which the five most prominent were the Ammanati, Chiarenti, Panciatichi, Reali, and Visconti. By the late thirteenth century, the Ammanati had regular establishments in

Bologna, Genoa, England, Orléans, Paris, Montpellier, and Acre in the Levant. Their English office unfortunately lent money to Edward I of England, whose failure to pay led to their bankruptcy early in the fourteenth century, but the others survived as economic and political leaders.

The statutes of 1330 list dealers in spices, gold, silks, and girdles; and money changers, cloth and iron workers, furriers, masons, vintners, innkeepers, butchers, shoemakers, painters, and barbers. In the twelfth century, Pistoia had done little to finish the wool it collected, but by 1330 the city had weavers, finishers, tailors, and stocking and doublet makers. There were also manufacturers of silk. The ironworkers made arms and sent them to Florence and elsewhere.

The cathedral continued to be an important force in the social life of the city; pilgrims came to the shrine of Saint James in the cathedral, and as we have seen, the Opera di San Jacopo, which saw to its maintenance and adornment, had a *palazzo* in the main square. This was run by a city official. Records that survive from the mid-fourteenth century on indicate that the Opera di San Jacopo sponsored increasingly lavish feasts. It also gave alms to the deserving poor of the city and the region. It survived until 1777. By the sixteenth century, a Confraternity of Saint James was organizing processions; we do not know when it was founded.

Other churches also had processions. In ceremonies similar to those at Florence, the Benedictine nunnery of San Piero Maggiore presided over the mystic marriage of its abbess with each new bishop, with feasting and processions, until the seventeenth century. The Cavallieri di Santo Stefano had their celebrations at the church of San Bartolomeo.

Miracles were a part of the social life of any medieval shrine, and in addition to the relic of Saint James the city had a miraculous fourteenth-century painted bed in the church of the Madonna del Letto. The twelfth-century bishop, Atto, was translated to a new shrine in 1337; by 1357, seven miracles had been recorded to be presented in the documents for his canonization.

The oldest city hospital, the Ospedale del Ceppo, has provided care for the sick and permanently infirm since its foundation c. 1277; the present building is remarkable for a series of polychrome terracotta *tondi* by Giovanni della Robbia (early sixteenth century), representing

the cardinal virtues, the theological virtues, and the seven works of mercy. With the hospital of San Gregorio, which cared for the insane as well as the sick and permanently infirm, the Ospedale del Ceppo also distributed alms and food to the poor during specified feasts.

Intellectual and Literary Life

There are manuscripts of Bibles, sermons, commentaries of Augustine, and the decretals of Burchard dating from the eleventh century and the early twelfth century still in the cathedral library and city archives of Pistoia, suggesting that the city must have had both a school and a *scriptorium*.

The earliest named author associated with Pistoia is Bishop Atto. According to a tradition at Vallombrosa, where he was abbot, he was a Spaniard, born in the Portuguese border town of Badajoz. At Vallombrosa, he wrote lives of two Vallombrosan monks—Saint John Gualbert (d. 1133) and Bernard, who became bishop of Parma. All that survives of Atto's literary endeavors at Pistoia is his correspondence with Rainerius and Archbishop Diego Gelmirez of Compostela about the relic of Saint James.

The lively account of the consecration of the first chapel to Saint James in the cathedral in 1145 is the work of Cantarinus of Pisa, who was active as a scribe in Pistoia in the 1140s. Authors of subsequent Jacobean miracles and liturgies are anonymous, but (as mentioned above) two Pistoian miracles were included by Jacobus de Voragine in his widespread collection of saints' lives, *Legenda aurea*. Miracles of Atto himself were collected after the discovery and reinterment of his body in the cathedral in 1337. Later in the twelfth century, Bishop Bonus wrote a treatise, *De cohabitatione clericorum et mulierum* (c. 1189).

Apart from these traces, we know little of the intellectual and literary life of the city. The cathedral must have had a school, but no distinguished scholars are identified with it. We know of independent grammar masters lodging in the city in the late thirteenth century. The city's own historians who left contemporary accounts all fall outside our period: Sozomeno (d. 1458); Manetti; and Francesco Ricciardi, who

wrote a city chronicle from 1494 to 1500.

Zaccagnini (1907) collected the work of a number of Pistoian poets—e.g., Paolo Lanfranchi, Meo Abbracciavacca, and Lemmo Orlandi—from the thirteenth and fourteenth centuries, but the only one of major importance is Cino da Pistoia. Cino, the son of *ser* Francesco dei Sinibalde (Sighibuldi, Sinibuldi), was a canon lawyer as well as poet of the *dolce stil nuovo* and was a friend and contemporary of Dante, who refers to him in *De vulgari eloquentia*. Though Cino served as the judge of civil cases in Pistoia in 1317, he spent most of his career elsewhere. He held teaching positions in Siena (1321-1326), Perugia, and Naples and also lectured in Florence and Bologna. His poems include exchanges with several Bolognese notables, as well as poems to Dante, the best-known of which is on the death of Beatrice. Cino's own ladylove, Selvaggia Vergiolesi, came from a Pistoian magnate family. Cino's Latin legal works—the only ones mentioned in his epitaph in the cathedral—include commentaries on the first nine books of the code of Justinian, and some *quaestiones*, *consilia*, and *additiones*. Cino bought property in Pistoia the year before he died, and a cenotaph was erected in the cathedral, near the altar of his uncle the bishop; Cino's nephew inherited the *castellum* and *torre*.

Zelone Zeloni was also a doctor of law, but c. 1374 he wrote a Latin epic, *Pia fons*. Tancredi Vergiolesi corresponded with Coluccio Salutati. Buonaccorso da Montemagno wrote *canzoni* to the lady Lauretta; his nephew and namesake lectured on law and wrote a treatise on nobility.

Art

The visitor to Pistoia is first impressed by its circuit of walls, dating from c. 1240 and still complete. Within the city, traces can be found of the first circuit with four gates, built under the Lombard king Desiderius c. 772; and the second circuit, of c. 1150. The magnificent tower of the fortress of Saint Barbara is a sixteenth-century addition. Within the walls are numerous churches, as well as the medieval houses where the builders of the baptistery lived, on Via Stracceria between the baptistery and Piazza della Sala. Piazza del Duomo contains the cathedral, with campanile and baptistery, and several medieval palaces.

Palazzo Pretorio dates from 1368 and still has carved or painted crests of *podestà*, *capitani*, and magistrates on the walls and vaulting of the entrance foyer. The Palazzo del Comune was built between 1295 and 1353 for the *anziani*. In the central square, Pistoia still has the feel of a well-built medieval city.

Since Pistoia had few native architects of the first rank, it imported architects from Florence, Pisa, or Siena for major projects. These outsiders, however, had local helpers and assistants, and some of their names have come down to us. We know a bit more about the decorative artists associated with buildings. A group of Pistoians—including Vincino, Leonardo, Enrico, and Giacomino da Pistoia; and Jacopo di Mazzeo—worked in Pisa on the Camposanto under Giovanni Pisano, son of Nicola Pisano, during the last years of the thirteenth century. They also worked in Pistoia. Enrico was probably responsible for the capitals on the main door of Sant'Andrea. In the church of San Paolo, Jacopo di Mazzeo made the statue of the saint above the architrave. Vincino may be the same as the Vincino who worked on the figure of the Madonna in an apse mosaic at the *duomo* of Pisa. Antonio Vite worked in Pisa in 1403, under Stamina, on the passion of Christ, and later assisted with the frescoes in the chapel of Saint Anthony Abbot in Pistoia.

We know little more than the names of most of the members of the artists' guild. Giovanni Cristiani is an exception. He is mentioned first in 1374 and again in 1382. According to Vasari, he had studied with Cavallini; he worked in the cathedral in 1394 and 1396 and wrote manuscripts. His three sons, Bartolo-meo, Jacopo, and Giovanni, were also painters.

The first cathedral was dedicated to Saint Martin of Tours in the fifth century, but it was rededicated in 595 to saints Zeno, Felix, Rufinus, and Proculus. The final rededication in 1453 was to saints Zeno and James. Pistoia suffered the usual vicissitudes of medieval cathedrals. There was a disastrous fire in 1108. Two years later, Countess Matilda of Tuscany gave money for a new cathedral. The massive columns in the nave survived the fire of 1202 and can still be seen. In 1240, Nicola Pisano rebuilt a three-aisle church. In 1298, the nave collapsed in an earthquake; its replacement was restored in 1660. In 1311, the portico was constructed with black-and-white marble from Monte Ferrato in

the territory of Prato and from Valdibrana. Although the choir and Romanesque apse were destroyed in 1599 to make way for the present Baroque apse, the cathedral remains substantially a thirteenth- and fourteenth-century building.

The elaborate silver and gilded altar of Saint James in the chapel in the south aisle was a lengthy project. The oldest part is the base, with New Testament scenes and apostles, which was worked in silver by Andrea d'Ognabene in 1316. The right-wing panel, with silver reliefs of other Old and New Testament subjects, was done by the Florentines Francesco di Niccolo and Leonardo di Ser Giovanni in 1361 — 1364. The left wing with scenes from the life of Saint James was completed by Leonardo in 1367-1371. Gilio Pisano did the silver seated statue of Saint James, surrounded by the other apostles, in 1353. Giovanni Cristiani designed the Christ in the mandorla above the apostles in 1394, and this was executed by the goldsmith Nofri di Buto and Atto di Piero Braccini. Pietro d'Arrigo (1386) did many of the figures of the four doctors and four evangelists, and Pace di Valentino executed many of the figures in the niches surrounding Saint James on the throne. In all, there are 628 figures on the altarpiece. The result of all this industry is nearly overpowering, but Gilio Pisano's Saint James preserves a compelling serene dignity.

Political turmoil did not disrupt the creative life of Pistoia. The *duomo* received further adornment in the fourteenth century, and the octagonal baptistery was begun in 1338 by Celiino di Nese. Jacopo di Mazzeo fashioned the marble statue of Saint James (1366) on the top right-hand side of the facade. The monument to Cino da Pistoia (1337), designed by Celiino di Nese, shows Cino flanked by four of his pupils. The main altar was redone in 1337 and again in 1606. In 1379-1383, Filippo di Andrea fashioned a reliquary of the Holy Cross weighing 28 pounds (about 13 kilograms) and requiring 6 ounces (168 grams) of silver gilt.

Across the *piazza* from the *duomo* is the baptistery, in green-and-white marble with a lead-covered cupola. It was begun in 1338 by Cellino di Nese, working from a design by Andrea Pisano, and was finished in 1359. Statuettes and bas-reliefs are by Andrea's sons Nino and Tommaso. The exterior of the baptismal font is decorated with panels from the choir of the *duomo*. In the interior of the font, an early

basin (1266) in polychrome marble by Lanfranco da Como has been discovered.

The fortified tower of the *poaestà*, dating from c. 1200, became the campanile for the *duomo* in 1301, with the addition of three orders of columns in the Pisan style of dark-green and white marble, designed either by Giovanni Pisano or by his assistant Fra Guglielmo di Pistoia. It is 22 feet (67 meters) high—the approximate elevation of Pistoia above sea level.

The oldest surviving church in Pistoia is Sant'Andrea, built in the first half of the twelfth century. The relief sculpture of the Adoration of the Magi above the doorway was done by Magister Gruamonte and his brother Adeodatus in 1166. The pulpit in the nave is an imitation of Nicola Pisano's pulpit in the baptistery of Pisa, by his son Giovanni. Also from the twelfth century (1159) is San Bartolomeo in Pantano, with a relief of Christ and the apostles (from 1167) on the facade.

San Giovanni Fuorcivitas—which, as its name implies, is located outside the twelfth-century city walls—has one long side adorned with dark-green and white arcades in the Pisan style, and relief sculptures on the architrave by Gruamonte (c. 1162). Inside are a pulpit by Fra Guglielmo da Pisa (a follower of Nicola Pisano) and a font by Giovanni Pisano, both of which date from c. 1270. The altar is composed of intarsia panels from the *duomo*, and to its left is a polyptych by Taddeo Gaddi (1353-1355).

Though it is an old foundation, the church of San Pietro Maggiore dates from the late thirteenth century. The architrave over the main portal is divided into niches containing white marble statuettes of Christ, Mary, and the apostles; these have been ascribed to Bono Fiorentino, who also worked on Sant'-Andrea. The church of San Francesco, begun in 1294, has frescoes on Franciscan themes by followers of Giotto. In the chapterhouse off the cloister in the church of San Domenico, also begun toward the end of the thirteenth century, are collected various frescoes by artists such as Giovanni di Bartolomeo Cristiani and some members of the Sienese school.

Plato

Plato (427-348 B.C.) was born into an aristocratic Athenian family. As a young man, perhaps in part owing to Socrates's influence, he refused to become involved in violent opposition to a democracy led by a relative. But when the democracy itself later executed Socrates, Plato decisively rejected Athenian politics for a life of philosophy. He subsequently founded the Academy, a loose group of intellectuals devoted to philosophy, especially mathematics. Though he did not take part in

domestic politics, he made several visits to Sicily, at some personal risk, in connection with plans for political reform. Most of his own philosophizing in the Academy was carried on through live discussions. What he wrote appeared in the format of dialogues in which Socrates usually played the principal role.

During the fifth century B.C., traditional Greek values had been challenged by the so-called Sophists, who subjected every aspect of life to criticism based on experience and on reason free from the inhibitions of convention. Socrates and Plato, too, insisted on the autonomy of reason, but at the same time they recognized that awareness of its own limitations is a primary requirement for fully rational thought. Many traditional values could then be rigorously criticized with no danger of relativism or nihilism. From the conviction that reason is the key to human nature but that mankind has powerful irrational impulses as well, Plato concluded that human beings are complex creatures and that philosophy, accordingly, is concerned with difficult choices between conflicting moral values. Goodness centers on our true self (reason and soul), evil on our lower self (passion and body). Rational choice is possible only if reason has something objective and binding to work with. Socrates and the Pythagoreans had already viewed philosophy in these terms, and Plato's thought borrows elements from both to support a full-scale justification—epistemological as well as ontological—for the conviction that philosophy is an entire way of life founded on what is absolutely true.

The dialogues are commonly divided into three main groups. The earliest group portrays Socrates attempting, unsuccessfully, to define key ethical terms. The middle group introduces a more positive, ambitious metaphysical basis for knowledge. The last group explores technical questions, especially in epistemology, reflecting current discussions in the Academy. The first group seems to represent Plato's initial grappling with issues raised by the critical questioning through which Socrates showed the need for a firm standard of value without fully providing one of his own. The elaboration of metaphysical tools—the theory of forms—in the middle period is Plato's own proposal (influenced by Pythagorean mathematics and Parmenides's theory of reality) concerning an objective foundation for knowledge and reality. Its central thesis is that only what is fully real can be fully known. The

last group of dialogues, some of which reopen fundamental issues, is an ongoing critical examination that marks the imperfection of human knowledge and is an abiding Socratic heritage. Plato thus has not so much a system as a basic orientation for which he is convinced good reasons can be advanced.

The theory of forms (this term, like others in Platonic philosophy, is often capitalized) is an ontological counterpart to and a basis for the distinctions between truth and error, good and evil, mind and body. Because material objects are subject to change and are inherently imperfect, they are not fully knowable. Yet relativism and skepticism are not inevitable, since we do in fact encounter something that is unchanging, perfect, and therefore an object of true knowledge. This is notably the case in mathematical knowledge of, say, the circle, which as studied by the mathematician is not material at all but a changeless, wholly objective reality. We have access to such objects only through the mind, and so there is a domain made up of perfect entities which serve as exemplars for the countless imperfect things we deal with physically (e.g., circular things). These fully real forms, or ideas, thus represent an alternative "world" opened to us by philosophy; that is why our true self lies in our power to reason abstractly. In addition to mathematical objects (which Plato may have regarded as somewhat different from other forms), forms include perfect patterns of various virtues and of structures in the material universe (e.g., living things), though he remains vague about many aspects of the theory.

We also live in bodies—hence the perennial tension in Platonism between the physical and intellectual dimensions of human life. In several dialogues on love (*Symposium*, *Phaedrus*) Plato gives both sides their due by embracing the paradox that true knowledge—e.g., of the form of beauty—is attained also through nonrational inspiration and passionate response to bodies. On a larger scale, though the universe is material, it is genuinely beautiful and rational in so far as it, too, is shaped by soul and mind at work through body (*Timaeus*).

Plato often uses terms taken from the religious mysteries in speaking of the encounter with true being or with the supreme idea of the good (*Republic*) as a "vision." Such language is natural, given the limits to analytic reason, and several dialogues include elaborate myths dealing with the soul's life outside an earthly body. As something nonmaterial

and akin to the forms, soul is immortal and subject to rewards or punishments for the embodied life it led in the course of cycles of reincarnation. Much of this is vaguely Pythagorean or Orphic; and though it is not intended to be taken literally in detail, it is meant quite seriously in so far as life is not explicable in purely immanent, material terms. Plato, however, leaves many questions unanswered about exactly what the world of pure being and pure thought is. He may have had in mind no more than another way of understanding the familiar material world. It often seems, though, to be another, higher world in a richer sense, the real home of true selves. This view, along with his ascetic insistence on the priority of soul over body, made his thought in its Neoplatonic version attractive to later Christian theologians.

The Jowett translation of Plato is often eloquent, though dated. The Loeb edition conveniently combines Greek text with translations but is uneven. Penguin translations are relatively recent and readily available.

Podestà

Podestà—in English, *podesta*—is derived from the Latin *potestas*, "power," and refers to an office with special authority in the city-states of communal Italy. The term was sometimes applied to leaders of bodies such as the *popolo* and usually denoted the commune's highest officer. The *podestas* were at first often, and later always, foreigners, chosen for their lack of local connections or interests and for their presumed impartiality in the face of inveterate civic strife.

Frederick I Barbarossa, after the Diet of Roncaglia (1158), imposed the first *podestà* to replace or supercede citizen-consuls as chief judicial and executive officials in cities under his control. By 1175, Bergamo, Lodi, Padua, and Parma, and in the 1180s Cremona, Milan, and Piacenza, had all chosen their own *podestas*, without reference to the emperor. After the peace of Constance (1183), powerful cities began establishing the office in subject towns; in 1276 Siena appointed twenty-seven *podestas*.

The position could be lucrative (the *podestà* of Forlì received 70 *lire*, and the *podestà* of Milan received 2,000 *lire*); but it could also be dangerous: some *podestas* were beaten, mutilated, or even killed (in Bologna in 1193 and 1194 and in Modena in 1213). The *podestas* served for nonrenewable terms lasting only one or two years, and later only six months; thus the demand for good *podestas* was always strong. "Professionals" developed a regular clientele: the Milanese Guglielmo Pusterla, for example, was appointed seventeen times. A special civic commission generally elected a candidate to be approved by the legislative council. Those chosen were usually men of arms or law with a background of respectable public service. They had to provide their

own judges, notaries, clerks, and bodyguard. The *podestà* took an oath of office, promising to obey and execute the laws, dispense justice, be accessible to the public, and avoid private meetings or entanglements. He presided over communal council meetings, led the army in wartime, kept the peace, and oversaw both criminal and civil judicial cases. He was paid every two or three months, and at the end of his term his performance was scrutinized very formally and carefully (a process known as "syndication").

The office of *podestà* flourished between 1220 and 1270; but with the rise of *signori*, who often usurped power from their positions as podestas, the power and authority of the *podesteria* faded.

Polo, Marco

What we know of Marco Polo (1254-1324) is based largely on his *Divisament dou monde*, later known as *Libro delle meraviglie del mondo*, or simply as *Il Milione* (after the name Emilione, which Marco Polo and his relatives used to distinguish themselves from the many other Polos in Venice). Tradition has it that Marco dictated this work to Rustichello da Pisa while the two were held in a Genoese prison. Rustichello, a writer of Arthurian romances, transcribed Marco's account into Old French (the preeminent vernacular of the romance genre), and embellished it with narrative and stylistic features typical of a medieval romance. Since people in the Middle Ages regarded *Il Milione* as a book of marvels, it took a long time before cartographers and explorers (including Christopher Columbus) became aware of its importance as a work of geography.

Marco Polo's work is more than a medieval romance or a book of marvels; it was probably meant to be a straightforward account of two journeys to China: the first by his father Niccolò Polo and his uncle Matteo Polo, and the second by all three Polos. There are numerous discrepancies among the manuscripts and early editions of *Il Milione* which probably do not reflect Marco's original account or Rustichello's lost rendition of it. There is, however, sufficient information in the most important manuscripts to enable scholars to reconstruct the Polos' two expeditions to China.

In 1260, the two Venetian brothers departed from Constantinople, where they had done business for six years, and arrived in Bukhara (in the Uzbek republic). They were forced to stay there for three years because local wars had cut off the roads leading back to the west. During that time they accepted an invitation to join an envoy from

Hulaku Khan to Kublai Khan (grandson of the Mongul conqueror Genghis Khan); and in 1266 they arrived at Kublai Khan's summer palace in Shangtu (near Tolun on the Shan-den Ho, or Luan River, about 150 miles—240 kilometers—north of Beijing). The brothers stayed at Shangtu for several months before returning to Italy with a message for Pope Clement IV from Kublai Khan.

Not long after their return to Venice in 1269, the brothers decided to bring Marco with them on their second expedition to China. They left Venice in 1271, accompanied by two Dominican monks who were supposed to travel with them to Shangtu but who soon withdrew from the expedition. When the Polos arrived in Acre (Akko) on the Syrian coast, they received letters from the newly elected Pope Gregory X for Kublai Khan. From Acre they went to Ayas (Cilicia) on the southeastern coast of Turkey and presumably took the caravan route to the Turkish cities of Kayseri, Sivas, Erzincan, and Erzurum before arriving at Lake Van. From there the Polos passed through eastern Armenia, where Marco describes Mount Ararat (the traditional site of Noah's landing after the flood), and then south to the Persian cities of Tabriz, Yazd, and Kerman before reaching the ancient Persian port of Hormuz (Bandar Abbas). When they realized that it was unsafe to go to China by ship, the Polos retraced their steps back to Kerman and went north to Mashhad, in northeastern Iran. It is at this point in the narrative that Marco recounts the tale of the "Old Man of the Mountain," one of the best-known episodes in *Il Milione*. From there the Polos went to Balkh (in northern Afghanistan), where, according to Marco, Alexander the Great married the daughter of Darius, and then to the castle of Taican (present Talikan), known for its nearby salt mountains. They spent a year in the province of Badakhshan while Marco recovered from an illness.

On Marco's recovery, the Polos presumably followed the Oxus (Amu-Darya) and Vakhsh rivers, crossed the Pamirs (known to Marco as the "roof of the world"), and reached the old silk route. The Polos followed the silk route through eastern Turkestan to the Chinese cities of Kashgar (K'a-shih), Yarkand (Soch'e), Khotan (Hotien), Keriya (Yiitien), and Cherchen (Ch'iehmo) before arriving in the ancient city of Lop (either Charkhliq or Milan), where they made preparations to cross the desert and the salt-encrusted bed of dry Lop Nor. After thirty days of

travel through the desert, they arrived at Sha-Chou (Tun Huang), the first Chinese city under the khan's rule. From there they went to Kan Chou (Zhangye or Chang-yeh) in Kansu province, where they spent a year waiting, presumably, for the khan to send them an escort. They resumed their journey by going south to Lanchou and then north along the Yellow River (and perhaps along the Great Wall) in the direction of Beijing, and arrived at Shangtu in 1275.

Marco spent the next seventeen years serving Kublai Khan on several diplomatic missions to the southern regions of the khan's vast empire, including Yunnan province, Burma (as far as the Irrawaddy River), Cochin China (Vietnam), and even parts of Tibet. Although Marco was impressed by most of these places, his greatest praise and most detailed descriptions are reserved for Hangchou in Chechiang province, the largest and most important city in China at this time. As scholars have pointed out, it was probably Marco's ability to describe in detail the people, customs, and geography of all these places (most of which the khan himself had never seen) that enabled him to remain in the emperor's good graces for seventeen years. Marco, in fact, claims that Kublai Khan rewarded him for his services by making him "governor" of the city of Yangchou, 50 miles (80 kilometers) northeast of Nanking (Nanching). Scholars, however, find it hard to believe that a foreigner could have held such an important position: it is more likely that Marco held a minor post, such as that of inspector.

Marco Polo's house and courtyard, Venice. Photograph courtesy of Gail L. Geiger.

In 1292, the Polos found an opportunity to return to Venice by joining an envoy escorting the princess Cocacin to her groom, Arghun Khan of Persia, the grandnephew of Kublai Khan. The envoy departed from the port of Zaiton (Chuanchou or Chinchiang in Fuchien province on the Formosa Strait) and sailed along the coasts of China and Vietnam to Sumatra, Ceylon, and the Malabar Coast of India before reaching Hormuz almost two years later. In Hormuz, the Polos learned of Arghun's death and delivered Cocacin to Arghun's brother Kaikhatu.

They spent the next nine months in Tabriz before going to Trebizond (the Turkish town of Trabzon on the Black Sea). From there they sailed to Constantinople and Negroponte (a Venetian colony on the Greek island of Euboea) before finally arriving in Venice in 1295. Not long after his return to Venice, Marco was taken prisoner by the Genoese while sailing a galley (possibly in 1296). He remained in prison until 1299, during which time he dictated to Rustichello his adventures in the far east.

The Polos' two journeys to China were the farthest any European had traveled to the Orient since the time of Justinian. In 1246, Giovanni di Piano Carpini, who was a Franciscan emissary of Pope Innocent IV and the author of a history on the Mongols (*Historia mongolorum*), went as far as Karakorum (the ancient Mongolian capital, about 250 miles—400 kilometers—west of Ulaan Baatar). In 1253, William of Rubruck, also a Franciscan friar, went to Karakorum as an envoy of King Louis IX of France. Although both friars left written accounts of their trips to Mongolia, neither account captured the imagination of so many people for so many centuries as Marco's *Il Milione*.

Pomposa

The Benedictine abbey at Pomposa in the region of Emilia, 50 miles (80 kilometers) southeast of Ferrara, was founded in 523. It remained a flourishing cultural center until the thirteenth century, when it declined because the marshy land it was built on had become malarial. Pomposa is the best surviving example in Italy of a free abbey—an abbey which was an independent state with territorial rights. Through the favor of

the German emperors, it won independent status, and in 1045 it oversaw the rule of a large territory bordered by the Po and Gauro rivers and the Adriatic Sea. In addition, it also ruled states outside this territory. Although the cloister no longer exists, the surviving remains of the complex include the chapterhouse, the refectory, some of the dormer (dormitory), the campanile, and a distinguished Palazzo della Ragione. All the buildings except for the Palazzo della Ragione stand along two sides of an open courtyard that the cloister once occupied. The restored remains of the Palazzo della Ragione, where the abbot dispensed justice, are situated to the west of the complex.

The church, Santa Maria, was built between 751 and 874, and its design follows the style of many other Romanesque churches of the time, which were characterized by heavy walls, small windows, and a semicircular apse at one end of the sanctuary. The basilican form of the church must have been inspired by similar models at Ravenna. The simple interior has planar stone walls that lack moldings, and three aisles that are nine bays long. In addition, there are three apses; the median apse, decorated with pilaster strips, is circular on the inside and polygonal on the outside. The wall division of the nave is reminiscent of Sant'Angelo in Formis. The lack of structural accents in the church's interior, with the noticeable exception of the raised apse, however, serves to provide an appropriate backdrop for the elaborately frescoed walls.

Pomposa Abbey. Photograph courtesy of Christopher Kleinhenz.

Abbot Guido of Ravenna built the atrium and campanile in the eleventh century. The campanile is constructed in the typical Lombard style of the time: its nine stages are marked with pilaster strips, applied shafting, and arched corbel tables. The Romanesque terra-cotta insets that decorate the campanile appear to have been inspired by similar ornaments at Ravenna. Although the church's exterior decorations do not have an overall iconographic program, the Ravennate design of Pomposa's ornamental terra-cottas, created by molding the clay by hand and then baking it, provides a magnificent decorative complement to the church's facade. The abbey also has two rose windows, a unique

Romanesque or medieval invention, which can be dated to the eleventh century. Pomposa's rose windows, consisting of decorated frames and pierced motifs, resemble a lace design worked into marble. The abbey's floors consist of *opus sectile* pavements alternating with mosaics, which are inspired by an eastern design and feature fantastic creatures contained within circular bands.

The decoration in the church at Pomposa, possibly executed by various Bolognese masters c. 1351, covers the entire nave, the apse, and the entrance wall and presents the viewer with an impressive array of the most complete collection of monumental painting still in existence. Much scholarly debate remains over the identification of the artists who created the extensive decorations, depicting the entire story of the Bible in great detail. The frescoes in the refectory at the abbey are in early Romagnol monumental style, which can trace its influences to Giotto and Cavallini. One of the most distinctive scenes, the *Last Supper*, boldly executed in cool, light colors, shows Christ and the disciples seated at a round table. Although the *Last Supper* has been considered the work of either Pietro da Rimini or Giovanni Baronzio, no positive identification of either artist's hand is possible.

Another artist, who specialized in light, warm colors with soft impasto, is Vitale da Bologna, an exceptional Bolognese master. He is thought to have created the scenes of Saint Eustace in the abbey c. 1351, with the help of some assistants. In addition, the frescoes in the nave of the abbey church are ascribed to Vitale and his pupils. The magnificent *Christ in Majesty* and the large *Last Judgment*, which dominate the nave of the abbey church, are executed in the style of Vitale, even if they are not the work of Vitale himself. The novel composition and iconography of the frescoes, combined with certain naturalistic touches, give new vitality and intensity to the biblical themes. For example, the *Entry into Jerusalem* shows, in addition to the traditional elements of the scene, one young boy reaching down from the top of a tree to assist another boy. The archaizing style of the scenes from the apse wall and the depiction of the *Last Judgment* on the west wall imply that the work was meant to reestablish an earlier design plan. The frescoes were restored in the 1960s by the Istituto Centrale per il Restauro.

Popolo

The term *popolo* (from the Latin *populus*, "people") once indicated the non-Roman—i.e., Germanic—elements of early medieval Italian society. By the later eleventh century, in urban northern Italy, *popolo* referred to the population of towns, sometimes represented in documents by their lay or ecclesiastical lords. As communal governments developed, gaining autonomy for the citizenry from lordship, the *popolo* were increasingly identified as a middle class between the urban feudal nobility and unskilled or part-time workers, the poor, and recent

immigrants. With armed and landed nobles generally dominating communal regimes, the skilled workers, artisans, merchants, and professionals, whose wealth and economic power were driving urban progress, began to demand representation and political power.

Popolani understood organization as it applied to guilds, parishes, and even urban militias, and they used these, and the emerging commune itself, as models for their own *societas populi*. These became states within states, with their own oaths, elected leaders (captains, *podestà*, and standard-bearers), councils (*priori* and *anziani*), courts, treasuries, and *palazzi* (e.g., the Bargello in Florence). Although they confronted the urban nobility as their rivals for power, and often battled nobles in the streets, they needed and welcomed disaffected nobles, who had military and leadership skills. In the early thirteenth century, *popolani* gained guaranteed representation on civic councils: one-third of the seats in Cremona (1210) and Vicenza (1215 and 1222), and half the seats in Milan (1212) and Piacenza (1222). By the 1280s, they controlled the councils, which even passed laws that specifically disadvantaged nobles (or "magnates"), and this marked the high point of the *popolo*'s power.

But success brought division, as poor (the *popolo minuto*: artisans, shopkeepers) opposed rich (the *popolo grasso*: bankers, international merchants), and the rich gravitated toward the nobility, weakening the solidarity of the *popolo*. Popular regimes drifted, by the early *Trecento*, into oligarchies or *signorie*, led at times by former captains of the *popolo*. In the *ciompi* revolt of the 1370s in Florence, we glimpse a brief resurgence of the *popolo minuto*, but their potential had long been spent.

Pornocracy

Scholars, especially those who are not Italian, have used the term "pornocracy" (from the Greek *pornos*, "prostitute") since the nineteenth century to describe the "rule of the prostitutes," a period when female members of the papal entourage enjoyed great authority in Rome and over the church.

The evidence for the notorious promiscuity and immorality of the papacy during the early tenth century comes mostly from Liudprand of Cremona's writings. During the Counter-Reformation, as Catholic historians became sensitive about prelates' lifestyles, Cardinal Baronius uncritically adopted Liudprand's scorn for the tenth-century popes. Thereafter, Catholic and Protestant authors perpetuated the stereotype of dissolute popes in that period, so that by the eighteenth century it was common to refer to the "regime of the whores" (*Hüerenregiment*). Voltaire, always polemical, was virtually alone in his dissent; he

claimed that several popes of the "iron century" had been worthy clerics. Indeed, though it is convenient and clever, the term "pornocracy" is too facile a characterization of the complex workings of Roman history in the early 900s.

Popes Sergius III (r. 904-911) and John XII (r. 955-964) are generally identified as the first and last representatives of the pornocracy. During the sixty-year period that they bracketed, the popes are said to have fathered other popes (in at least one case by a fifteen-year-old girl), and to have attained the Roman pontificate because of their sexual appeal to influential matrons or even to the whole population of Roman women. But within the pornocratic period, behavior was not uniformly scandalous. Alberic's rule at Rome (932-954) marked a hiatus in the pornocracy, as he patronized ecclesiastical reform. By contrast, both Liudprand and the chronicler Benedict of Sant'Andrea mentioned the years when a woman, Marozia, headed the house of Theophylact (924-932) as particularly debauched.

Contemporary ecclesiastical writers felt a venomous hostility for the popes of this period. This is only partly explained by the chroniclers' indignation at a situation which they considered perverse (and which they compared to infamous Old Testament precedents). Aversion to the clan of Theophylact, which monopolized political authority in the competitive atmosphere of tenth century Rome, and ideological opposition to a Romanocentric, anti-imperial series of popes likewise contributed to forming the dark opinions of the chroniclers.

Any evaluation of the pornocracy depends on how much reliance is placed on the partisan accounts of the tenth-century chroniclers. Liudprand and Benedict of Sant'Andrea were not exact contemporaries of the early pornocrats, whose careers they interpreted as a backdrop to that of John XII. The collated evidence indicates that several popes of the period were licentious and applied moral standards unacceptable to other clerics; still, it is questionable whether sexual excess was the salient, defining characteristic of this period in the history of the papacy. Recent historiography is moving toward a rehabilitation of the pornocracy and its protagonists, and away from interpretations of the tenth-century papacy as a decadent institution populated by spineless debauchees, waiting to be swept aside by various reform movements. However, this effort is hampered by a lack of evidence generated by

those directly involved in papal or Roman affairs in the first half of the tenth century.

Portinari Family

Like the dal Borgo, Pulci, Strozzi, del Rosso, dell'Antella, and Saltarelli, die upwardly mobile Portinari were members of the Florentine mercantile elite. They were also intensely involved in the political life of Florence in the thirteenth and fourteenth centuries. They came originally from Fiesole, and the first documented member of the lineage in Florence was Torrosiano dei Portinari (1201). Though most Portinari were supporters of the *popolo*, several had been Ghibelline sympathizers during the period of Ghibelline control of the city (1260-1266). Segna di Assalto Portinari served in communal councils under the Ghibelline regime, and Doccia and Giano dei Portinari are also said to have served in that government. Several members of the lineage were inscribed in the wool finishers' guild (Arte di Calimala) and served in the government as priors. The Portinari were also important creditors. Like the Pucci and Alberti companies, a Portinari company had established a permanent office in Naples in the early fourteenth century.

Folco di Ricovero dei Portinari (d. 1289) had at least two daughters, Ravnana and Beatrice (the supposed beloved of Dante). His son, Manetto, was apparently a close friend of Dante. Folco, a banker, was closely associated with the Cerchi and was also a very influential public figure in the late thirteenth century. He served as consul of the wool finishers' guild in 1280 and 1288 and was prior on at least three occasions (1282, 1285, and 1287). In 1286, he founded the hospital of Santa Maria Nuova, equipped initially with at least twelve beds. He also appeared as a principal patron of the religious community of Santa Maria dei Serviti (Servites) in the north of the city. He died in 1289.

Beatrice dei Portinari, the daughter of Folco, married Simone di Messer Jacopo dei Bardi. According to Boccaccio, she was the inspiration for Dante's Beatrice. Dante probably first met her in 1274. She appeared in three of his major works: *La vita nuova*, *Il convivio*,

and the *Divina Commedia*. Scholars know very little about her life. She apparently died in 1290 at the age of twenty-four, shortly after the death of her father.

Pragmatic Sanction

The first "pragmatic sanction" was an edict issued by the Byzantine emperor Justinian in August 554. This was two years after his general Narses had defeated the last two Ostrogothic kings and effectively shattered the Gothic regime in Italy, and just following the emperor's humiliation of the Roman pope, Vigilius. The edict provided the basis for the reestablishment of imperial government in the peninsula.

The twenty-seven articles of the edict were designed in full awareness of the ruin and devastation that Italy had suffered during some two decades of the Gothic wars, and of the sensitive issues of conflicting property claims resulting from the Ostrogothic occupation. The starting point was therefore a confirmation of the acts of the previous Gothic rulers, excepting only the "tyrant" Totila, and a validation of all contracts undertaken during the upheavals. Provisions were made for restoration of property lost during the hostilities, for the repair or renewal of public works, and for traditional food doles to the urban populace. Taxes, which were to be paid largely in produce, would be carefully regulated (with new provisions for weights and measures) to avoid earlier abuses by venal imperial officials. The judiciary system was restored, and care was taken to guarantee civil due process to all Roman citizens. However, special privileges and exemptions were reserved to great landowners.

The edict preserved the earlier administrative structure essentially intact, except that Italy was now defined solely as the main land—the islands of Sicily, Sardinia, and Corsica were assigned to other jurisdictions. Of particular interest was a change in the method of selecting local governors; their previous appointment through the central regime had allowed too much fiscal abuse, and they were now to be chosen honestly by the bishops and magnates of each locality. Although this arrangement undoubtedly curbed some corruption, it strengthened the local landowners, while also confirming the increased role of the church hierarchy in civil government.

The edict was entitled *Pragmatica sanctio pro petitione Vigili* and was included among Justinian's *Novellae* ("new laws"). It was the first major promulgation to bear the designation "pragmatic sanction," which would be applied in later centuries to instruments of agreement between individual governments and the Roman church.

Prato

The Tuscan city of Prato lies in the broad valley of the Bisenzio River, flanked by the long, low hills of the Monte Calvana and Monte Albana, about midway between Florence and Pistoia. Modern Prato is a bustling center of textile production at the crossroads of the Autostrada del Sole (Milan-Rome) and the Autostrada del Mare (Florence-Pisa-Genoa). In the early 1990s, Prato was Tuscany's third largest city (with a population of about 160,000), and, in 1992, it became the capital of a new province. Its wealth is based on cloth, and has been for 800 years. Several thousand—mostly small—factories continue to absorb immigration to the sprawling suburbs of the walled medieval town.

The site of Prato may have been occupied by the Etruscans and was certainly occupied by a Roman town, probably housing a garrison. Little remains from the Roman period apart from a few fragments and inscriptions, and possible topographical remnants. The town was situated near the Via Cassia and was very likely little more than a stopping-off point and a center for local agricultural production. Evidence of Christianity in Prato goes back no earlier than the third century and tells no coherent story. Pagan remains disappear after the

late fourth century. The archaeological record indicates a very low level of activity on the site from the mid-third century until the time of Charlemagne. In fact, the entire Val di Bisenzio was declining in population and economic activity long before the great Germanic invasions of the fifth and sixth centuries. The 21 miles (34 kilometers) between Florence and Pistoia were marshy and heavily wooded, had no fortified center, and thus fell prey to marching or marauding Goths, "Greeks," Lombards, and Franks. The Lombards tended to be especially destructive, but they also settled in small groups in the area, leaving place-names that echo their presence. The earliest evidence of Pratese law and legal practice embodies elements of Lombard custom, such as the replacement of Roman testamentary practice with "donation" and the use of the *Morgengabe* ("morning gift") in marriage arrangements. Some of these elements remained in use until the late thirteenth century.

In the absence of effective secular authority, the institutions of the early medieval church imposed at least rudimentary jurisdictional order on the Val di Bisenzio. Monasteries carved out holdings. The river itself formed a rough boundary for the diocese of Pistoia, under whose bishop Prato remained throughout the Middle Ages. (Prato would gain its own bishop in 1653, and full episcopal autonomy in 1954.) By the end of the eighth century, Catholic religious life was well established in monasteries and around chapels and churches that dotted the hillside and plain. Villages grew up around some of these, and those with walls or a tower for protection were called *borghi*.

During the early ninth century, the bishop of Pistoia exercised even greater power than the local Frankish count. With the treaty of Verdun (843), however, Adalbert I became the first powerful count-duke. This treaty was a royal attempt to unify much of the administration of Tuscany, and it included jurisdiction over Pistoia and the Val di Bisenzio. The kings also interfered in ecclesiastical matters, appointing courtiers or family members to bishoprics. In the early tenth century, the Frankish kings reinstated the heads of powerful Lombard families as local counts in northern Italy, and thus the Alberti clan came to control and protect the area that would become Prato.

Palazzo Pretorio, Prato. Photograph courtesy of Christopher Kleinhenz.

The stronghold, or *curtis*, of Ildebrandino di Alberti on the Bisenzio River attracted settlers, and the Borgo di Prato was born. *Prato* means "meadow," and the name probably distinguished this Alberti settlement from others in the hills. Nearby, from at least 994, stood the *pieve* of Santo Stefano. This was the region's principal church, which housed the baptismal font and eventually a chapter of canons. In the midst of private churches and chapels, it served as the diocese's outpost in the central valley. Around the *pieve* evolved another quickly growing population center, Borgo di Cornio. During the eleventh century, the

Alberti counts merged these two settlements—one with its church, the other with its castle—and kept the name Borgo di Prato (sometimes referred to as Pezzanese).

By 1150, the process of amalgamation was complete, and large numbers of people immigrated from the countryside to the security and new occupations offered by the Borgo. Indeed, many smaller villages vanished from the records. In part, the attraction of Prato had to do with broader issues of eleventh-century ecclesiastical reform. Santo Stefano was a reformed "Gregorian" church removed from direct lay control and the abuses that often accompanied such control. Many of the local churches and chapels remained in lay hands, and some of these were abandoned by the faithful, who sought orthodoxy and better service from the *pieve*. This issue of reform often pitted landed nobles, ecclesiastical authorities, and the common people against one another, and it served as a basis for the development of both communes and *popoli*. Artisans, local merchants, moneylenders, and landowners built up the town in the eleventh century; and shops, houses, hospices, churches, and chapels sprang up within the walls to meet new civic needs

In 1107, Prato and the Alberti defied Matilda of Canossa, countess of Tuscany. Her army of Lucchesi, Florentines, and Pistoiesi destroyed Prato after a three-month siege. The Pratesi rebuilt their town, and it flourished without interference from its Alberti lords. In fact, the Alberti encouraged Prato's autonomy and civic growth, and they grew rich along with the town. Thus, the development of the commune in the twelfth century was not the typical reaction against meddling by local feudal lords. On the contrary, opposition to the ecclesiastical control of Pistoia united the Pratese lords and populace; and this opposition grew fiercer in the twelfth century as Prato made unsuccessful bids for its own bishop and fought to control the incomes of the churches in its jurisdiction (1138-1142).

The earliest mention of the consuls of the commune dates from 1142, but some organization no doubt long preceded that. Although commune and lord normally enjoyed good relations, the people joined with Florence in 1154, and with Florence and Lucca in 1184, to defeat the feudal ambitions of the Alberti in the area. By 1186, the Alberti clan had ceded its jurisdiction over Prato to the emperor and had turned its

attention southward, to Semifonte. By 1193, an imperial *podestà* had been established, and in 1195 a viscount arrived to exercise supreme local authority.

The lines of communal development remain unclear, but a document of 1212 mentions seven councilors. In 1246, the ruling body included representatives from all of the town's eight sections, as well as fifteen guild rectors, and consuls of the knights and of the merchants. The *popolo*, an independent organization in the town's power structure that excluded nobles and magnates, was also fully developed by 1252. It was led by a foreign captain, four *anziani* (elders), twenty-four councilors, and a larger council of forty. Given its natural Guelf leanings (in opposition to the generally Ghibelline nobility), its history and evolution are closely bound up with events in Florence, which was the arch-Guelf center. As elsewhere in Tuscany, the reaction of the Pratese Ghibellines following the debacle at Montaperti was swift and strong. From 1260 to 1266, many prominent Guelf *popolani* were exiled or imprisoned.

After 1266 the *popolo* again dominated Pratese politics, but in 1271, a resurgent *parte Guelfa*, led by four captains (of whom two had been exiled and two imprisoned), effectively ruled Prato. In 1279 an oligarchic reaction set in, and the government was reorganized. Twelve *popolani* councilors (modeled on Pisa's twelve *anziani*) were to aid the captain of the commune, and three citizens from each of Prato's sectors formed the "council of twenty-four." In 1285 a further reaction added sixteen members to the council of twenty-four and a new body, "the eight" (*otto*), as counselors to the captain. In official documents, to the title *comune* was added "and *popolo*": *comune et populus*. The *otto* became extremely powerful and strictly limited admission to its own ranks.

In 1292, Prato adopted the *Ordinamenti sacrali et sacratissimi*, a law code similar to the Florentine ordinances of justice but directly imitative of codes in Pistoia and Bologna; it included statutory revisions typical of the period. Many of these new laws were aimed directly against the noble or magnate class, which was widely seen as too powerful, arrogant, rich, and Ghibelline despite its traditional economic, administrative, and military leadership. The *popolo* and Guelf oligarchy formally excluded from participation in government

even magnates who were duly enrolled in guilds. For those identified as magnates, fines were much higher, guilt for crimes against *popolani* was simpler to prove, and expulsion from the city was easier to obtain. From 1293 on, the *otto* were no longer "counselors of the captain" but "defenders of the *popolo*." In addition, the office of "standard-bearer (*gonfaloniere*) of justice," traditionally held by the leader of the *popolo*, was also co-opted by the *otto*: the standard-bearer had to have been a member of the *otto*, had a voice in their proceedings, and had to live in their quarters during his term.

By the early *Trecento*, the vehement antimagnate stance of the regime had softened, in fact if not in law. In part, this was because defections by magnates to the *popolo* class (by official declaration), interclass marriages, and aspirations of the bourgeois to nobility made extreme measures against the magnates less and less tenable. The shift may also reflect the declining demographic and economic conditions in the Val di Bisenzio (as elsewhere in Tuscany in the same period). Around 1290, Prato had claimed some 4,000 hearths; but in 1339—which was well before the black death (1347-1348)—there were only 2,762. By 1429, the number had plummeted to 951 (representing about 3,517 people).

The influence of Florence in Prato continued into the *Trecento* as Black Guelfs became prevalent in both cities (1301). Prato experimented with Florentine voting procedures that included eligibility lists for offices and the drawing of names from a bag for candidacy or election (1305, 1310-1311, and 1314). Political and economic ties drew Prato closer into Florence's orbit, and soon *come si fa a Firenze* ("as it is done in Florence") became common shorthand for all manner of procedures.

The descent of Emperor Henry VII into Italy for coronation (1310) was opposed by all good Tuscan Guelfs, and Florence lent generous (and calculated) aid to the Pratesi, including a Florentine garrison for the *castello*, built by Frederick II in the mid-thirteenth century. In 1313, Prato, threatened by Henry's reentry into Tuscany, offered its allegiance and fealty—which still belonged properly to the emperor—to Robert of Anjou, king of Naples, who was a champion of the Guelfs. In the 1320s, the campaigns of Castruccio Castracane of Lucca threatened Florence and its allies, and again Florence insinuated itself more and more into its neighbor's affairs. In 1326, Charles of Calabria received Prato's fealty,

and he sent Florentine vicars to oversee the town.

On 23 February 1351, all pretense to autonomy in Prato fell away as Queen Giovanna (Joanna) of Naples, who had inherited control of the town, presented that control to Florence in return for 17,500 gold florins. Not surprisingly, the arrangement had been engineered by a Florentine, Niccolo Acciaiuoli, seneschal of Naples. Thenceforth, Prato received a *podestà* from Florence. Prato's councils could still pass laws for the town, under the eye of the *podestà*, but Florence had the right to veto them if it saw fit. Florentine taxes were levied, but most civic organizations, including the guilds, were only minimally affected: decades of Florentine influence had removed the need for radical changes after 1351. In the later fourteenth century, the Florentine government tightened its control over its dominions, entailing a further reduction in Prato's self-government.

Economy

Throughout the early Middle Ages, agriculture dominated the economy of the Val di Bisenzio. In the early period, this was small in scale and was hampered by the marshy floor of the valley. Woods and wetland covered much of the territory well into the twelfth century, but canalization, probably begun by monastic houses, revolutionized the use of the land. Lay and ecclesiastical feudal lords, including the bishop of Pistoia and monastic houses in Florence and Pistoia, controlled most of the land, but even in the eleventh century there were at one point 217 freehold parcels in the region of Prato.

Further drainage made more fertile land available, and at least by the end of the tenth century a market had developed in Borgo di Cornio. In the twelfth century a full range of crops were being grown to feed the expanding town population. Typically, cereals headed the list: wheat, spelt, barley, oats, millet, and rye all found their way to Pratese mills and bakers. Pears, apples, figs, plums, chestnuts, and almonds grew in small orchards, and vineyards provided grapes for wine. Peasants and monks cultivated olives, flax for linen, and woad, a popular dyestuff.

Canalization of the Bisenzio was also vital for the development of mills. Monks and feudal lords had provided mills for grinding grain,

and by the very early twelfth century the tamed waters were turning the wheels of cloth-fulling mills (the earliest recorded is from 1107). Nearby was a good source of the soil that was necessary for the fulling process, and new channels off the river's main course invited the further development of this new industry. By the later thirteenth century there were thirty fulling mills and forty-four flour mills in the valley. In the late twelfth century one of Prato's earliest guilds developed, that of the *padroni* (bosses) of the mills. The *padroni* had many interests in common, not least of which were the continued free flow of the river, the regulation of further channeling, and the restriction of entry into the market.

Sheep were not plentiful in the vicinity, and early on the ancillary enterprise of wool importation was added to that of actual cloth production. Local artisans in both town and countryside took up weaving the cloth. Dyeing was carried out in town on a larger scale, since huge vats and drying racks were required. At first, local woad probably sufficed, but over time imported dyestuffs added greatly to the value of the merchandise. Importation of the raw materials, production of the cloth, and exportation of the finished product fed an expanding commercial network both in the town and beyond. The wool guild, or *Arte di Lana*, emerged from familial and monastic origins to regulate those who participated in this burgeoning industry, and to protect the industry's interests in the commune. The *Lana* was the most powerful of Prato's guilds.

The purchase of raw materials and the maintenance of the mills required capital, and local landlords readily invested in the cloth enterprises, often shifting resources away from less lucrative agricultural uses. In the long run, these connections helped ease the tension between nobles and *popolani* in Prato, and clearly delineated the relationship between the countryside and the town.

The division of labor that accompanied wool cloth production and trade further advanced economic organization in Prato, especially during the thirteenth century. The money changers and moneylenders guild of the *Cambiatori* flourished from mid-century on; and the guild of notaries buried 432 of its members between c. 1250 and 1332—a figure that suggests how many notaries there were. In a commercial atmosphere like that of Prato, notaries had ample work drafting and

recording all manner of private documents, including contracts, partnership agreements, and surety arrangements, and more personal instruments such as wills, dowry agreements, and donations to religious houses. One notary was Scrigno, father of Convenevoles, the tutor of Petrarch. During the thirteenth century, along with the development of the commune and *popolo*, the guild system flourished. The number of guilds representing merchants, crafts, or professions increased from fifteen to twenty-six, and without a division into major and minor *arti* such as occurred in Florence.

Prato's most famous entrepreneur was Francesco Datini (1335-1410), whose *palazzo* today houses his own archives—including some 500 account books and 140,000 letters—and the city's. Datini was the son of a local taverner; he lost both parents in the black death of 1348, made a small fortune as a merchant in Avignon, and spent his last thirty years in Prato directing a set of commercial companies that had main branches in Avignon, Barcelona, Florence, Genoa, Majorca, and Valencia. His trading network stretched from England to the Black Sea, and across the Mediterranean. He dealt in almost anything that could be exchanged, but especially in wool and cloth, in good Pratese fashion. Datini's records are uniquely comprehensive and illustrate that despite poor economic conditions, a healthy profit could come to a well managed and innovative business. His activity certainly spurred the ailing Pratese economy, as his network brought wool from the best sources in Europe and distributed cloth across the Christian world. Important as he was, Datini was no Cosimo de' Medici; he chose to play no political role in Prato, nor was he much of a patron of the arts. In his will, though, he established a foundation to support abandoned children in Prato, to which he gave virtually all of his vast fortune. It is said that Prato is still using funds which originated with Datini. His innovations in business practices and his contributions to the local economy earned him a statue (1896) that stands today in the Piazza del Comune.

Buildings

The medieval walled town formed a rough hexagon with one side

running along the Bisenzio. It bristled with family towers, of which a few stumps remain today. The present-day cathedral, originally *pieve*, of Santo Stefano was begun in 1211; its green-and-white facade was added between 1385 and 1457. The nave is flanked by green marble columns and a striped green-and-white arcade. The cathedral is notable for its exterior pulpit by Donatello and Michelozzo (1434-1438), which was created to display the town's greatest relic, the *cintola* (cincture or girdle) of the Virgin Mary. This object was brought to Prato in 1141 by the crusader Michele Dagomari and is said to be the cord handed to "doubting" Thomas, the apostle, by Mary from heaven after her assumption. The *cintola* is displayed on certain feast days and has its own chapel immediately inside the cathedral. This chapel contains a Madonna and Child carved by Giovanni Pisano (1317) and is covered with frescoes by Agnolo Gaddi (1390s) of the life of Mary and the history of the relic.

Prato's mendicant churches are relatively small but notable. The Franciscans traveled through Prato in their earliest days, and they established a church in Prato in 1228. The current church of San Francesco was built between 1275 and 1295 with a trussed roof and a green-and-white striped facade. Its interior was frescoed under Datini's patronage in the 1390s, and his tomb lies prominently at the foot of the altar, according to his last wishes. The chapterhouse (Cappella Migliorati) contains well-preserved frescoes, painted at the end of the fourteenth century by Niccolò Gerini. Radical restoration took place in modern times.

The Dominican church of San Domenico was founded in 1283 and was completed by 1322 under the direction of Giovanni Pisano. Little of the original medieval decoration remains. The Augustinians, too, had a convent and church in Prato. Nestled against the northern wall, the complex was built in 1271 but has been greatly altered in the years since. Its oratory of San Michele and chapterhouse contain late medieval work by Gerini and others.

The Palazzo Pretorio, seat of government in medieval Prato, is a tall structure with a Gothic facade; its height is exaggerated by its second-story entrance. The *palazzo* incorporates two buildings: one of brick from the thirteenth century, and one of limestone from the early fourteenth. Battlements were added in the sixteenth century. Today it

houses the Galleria Comunale and the Museo Civico.

In his effort to control his dominions in Italy, Emperor Frederick II built many castles, including the *castello* in Prato, probably dating from 1237-1248. Although it resembles Frederick's southern Italian castles, it is unique in the north. It remains an imposing edifice, although the restored curtain walls are only an empty shell.

Preachers and Preaching

The study of preaching in medieval Italy has expanded greatly in recent decades as more and more scholars have become aware of the prominent role played by preachers in all sectors of Italian society throughout the period. At the same time, we have discovered the abundance of insight and information furnished by sermon texts on surprisingly numerous topics of research, even far beyond the realm of theology and spirituality. No portrait of medieval Italian society, no reconstruction of the "mentality" of the period, can be complete without taking into consideration the peninsula's many preachers and the traces, written or other, they left behind.

The Periods of Italian Preaching

In studying preaching, one may distinguish between popular (destined for the large masses in cities, towns, and countryside) and elite

(destined for smaller, specialized audiences such as those in monasteries and universities). Much more attention has been focused on popular preaching, probably and above all because it opens a window onto the daily life of a far larger segment of the population. The great season of popular preaching in Italy that begins with the rise of the Franciscans and Dominicans in the first quarter of the thirteenth century (and does not end, in fact, until the seventeenth) is also the best documented and thus the most studied and understood. Our image of the state of preaching in preceding centuries is at times shadowy and fragmentary, owing to the paucity of surviving documentation and scholarly research. However, certain observations may be made with reasonable certainty.

Like every other aspect of life in western society, with the onset of the "dark ages," preaching—public instruction in faith and morals—suffered a tremendous decline in quality and frequency. In the long stretch of time between the death of the last great Latin father of the church—Pope Gregory the Great (d. 604)—and the rise of the mendicants in the thirteenth century, the state of preaching in Italy appears to have been universally dismal. To be sure, there were exceptions to this rule: those very few, privileged places, such as the monasteries, with their higher level of domestic literacy and spiritual striving; and the occasional diocese or parish lucky enough—temporarily—to have that rarest of early medieval personages, a well-instructed, spiritually enlightened, and pastorally conscientious bishop or pastor. When preaching in this long period did occur—above all, within the context of the mass on Sundays and holy days—it often took the form of mere superficially adapted vernacular translations of the homilies of the fathers of the church—especially saints Ambrose (d. 397), Jerome (d. 420), Augustine (d. 430), and the aforementioned Gregory. Even as late as the second decade of the thirteenth century, we find Pope Innocent III, an accomplished preacher in his own right, attempting to set an example for his fellow preachers by simply translating one of Gregory's sermons word for word in a public liturgy on the feast of Mary Magdalene. (The story is related by the Dominican master general Humbert of Romans, in his *De eruditione praedicatorum*, one of the most widely disseminated scholastic *artes praedicandi* of the late medieval period.)

The church's intermittent calls during these centuries for more and better preaching went unheeded, mostly because of a severe lack of trained personnel. The Carolingian reforms directed at the clergy reached Italy in, at best, only attenuated form; and the later Gregorian reform, although successful in its main objectives, had little effect on the quality of preaching. A more urgent impetus for reform in preaching finally came, beginning in the second half of the twelfth century, with the challenge to the clerical monopoly on preaching raised by the many new lay "apostolic" groups—some heretical, such as the Cathars and Peter Waldo's Poor of Lyon; but others not, such as the Umiliati of Lombardy. (Documentation of the preaching of these groups—as well as, we might add, that of the Jews of medieval Italy—has all but disappeared.) In response to this threat, the Fourth Lateran Council of 1215 passed legislation (constitution 10) whose goal was to ensure a proper supply of adequately trained preachers and confessors.

The Dominance of the Mendicants

The council's goal, however, would have probably gone unfulfilled had it not been for the simultaneous rise of two prodigiously successful and influential brotherhoods of late medieval Italy: the Order of Friars Minor (O.F.M.), or Franciscans, founded by the charismatic Francis of Assisi (d. 1226); and the Order of Preachers (O. P.), or Dominicans, founded by the learned Castilian Dominic Guzman (d. 1221). Both of these so-called mendicant orders made competent, ubiquitous preaching—to both popular and elite audiences—one of their most urgent priorities. Their success in this endeavor was such that they soon effectively eclipsed all other categories of preachers—most notably, the secular clergy—and continued to do so for centuries. The most important preachers of late medieval (and, indeed, early modern) Italy were almost all mendicants. Notable examples are, among the Franciscans, Anthony of Padua (d. 1231), Bonaventure of Bagnorea (d. 1274), Servassanto of Faenza (active second half of the thirteenth century), and Matteo d'Acquasparta (d. 1302); and among the Dominicans, Peter Martyr of Verona (d. 1252), Jacopo da Voragine (d. 1298), Jacopo Passavanti (d. 1357), and Giovanni Dominici (d. 1419).

Two Augustinians must also be mentioned: Alberto of Padua (d. 1328) and Simone Fidati da Cascia (d. 1348). In terms of both sheer abundance and engaging vivacity of extant sermon texts, however, none can rival the Dominican Giordano of Pisa (d. 1311) or the phenomenal Franciscan Bernardino of Siena (d. 1444).

Saint Bernardino of Siena. Hartmann Schedel, *Liber chronicarum* (Nuremberg Chronicle). Nuremberg: Anton Koberger, 1493, p. 248r.

The “Modern” or Thematic Sermon

Along with the rise of the mendicant orders came the emergence of the

sermo modernus, or thematic sermon. Its predecessor, the *sermo antiquus*, took essentially the form of the patristic homily, a loosely structured verse-by-verse exposition of a Gospel passage, interpreted in a simple spiritual and devotional key. Although the patristic-style homily never disappeared (especially in preaching to less educated audiences), the thematic sermon became the standard after the first quarter of the thirteenth century and reigned supreme for at least two more centuries. (At no point did the church ever mandate a specific form of preaching, so preachers were at all times free to follow whatever form they desired.) A product of the scholastic mentality, with its love of minutely articulated order and meticulous logical analysis, the thematic sermon was a complex, pedagogical structure that had as its foundation the *thema*, a scriptural verse usually chosen from the mass of the day, whose moral and doctrinal content was explained, step by step, in the *dilatatio*, through a series of divisions and subdivisions (*distinctiones*) of the original biblical "proposition."

Summoned to this at times laborious instructional-persuasive task were traditional allegorical interpretations, corroborating quotations from the church fathers and doctors (*auctoritates*), etymologies, data and observations from the natural sciences, and narrative examples (*exempla*)—often lengthy and comically entertaining—from history, hagiography, and the everyday life of the audience. These homiletic tools were all available, prepackaged, in many dictionaries and handbooks, and the numerous *artes praedicandi* supplied the preacher with the necessary theoretical and structural foundations. Exceptionally busy or under-educated preachers also had recourse to ready-made sermons anthologized in the many *sermonari* of the period. The language of all popular preaching was the vernacular, although most secondhand sermon transcriptions (*reportationes*) and actual published texts from the preachers themselves are usually in Latin.

The Sermon as Social-Civic-Religious Event

Although the primary context for preaching was the mass on Sunday and holy days, the ecclesiastical and civic calendar offered endless occasions for preaching. Indeed, as the medieval period progressed,

preaching became increasingly separate from the liturgy, just as it moved from the confines of the church building to the public square in the case of exceptionally popular preachers. Since the moral instruction imparted by the preachers was deemed invaluable for the collective and individual wellbeing of the citizenry, it was often the secular, not ecclesiastical, authorities who arranged and paid for the services of the preacher. There was at times lively competition among the towns for booking an exceptionally good preacher, especially during Lent, the premier preaching season.

What we know of the logistics of Bernardino of Siena's preaching missions during Lent and Advent was probably usual for the period: each day at the crack of dawn, men and women, young and old, from all walks of life, from both the town and its countryside, would gather to listen to the preacher, who, for two to three hours, would attempt to stir them emotionally to contrition for their sins, while instructing them, in at times detailed fashion, in the essential elements of their duty as both Christians and citizens. (Sano di Pietro's famous panels of Bernardino preaching to the Sienese are, however, idealizations, depicting the faithful in excessively orderly ranks and as highly reverential in demeanor.) Since literacy was low, books were rare, and free public instruction and respectable entertainment—especially for women—were always welcome, it was probably not too difficult for preachers to capture the attention of the populace and to persuade them to change their behavior, at least temporarily. However, ensuring their true, lasting conversion was another, more challenging and elusive matter.

Priscian

The Latin grammarian and poet Priscian (Priscianus, fl. 485-526) was born in Caesarea (Algeria) but studied and taught in Constantinople. For patrons in Rome, which was then under Ostrogothic rule, he composed manuals on Latin rhetoric, metrics, and metrology that stressed Greek antecedents; among other minor works, he freely translated Dionysius's *Description of the World*. Priscian's greatest and most influential work was the *Grammatical Institutions*, a massive advanced grammar of the Latin language (974 printed pages), abundantly illustrated with more than 10,000 lines of quotations from a

host of authors, notably Cicero, Virgil, and Horace. The first sixteen books, later known as *Priscianus maior*, dealt with the parts of speech; the last two books, *Priscianus minor*, dealt with syntax. Both *maior* and *minor* applied Greek linguistic theory to Latin. During the Carolingian Renaissance, this work became the standard textbook for upper-level instruction in Latin, and it retained its preeminence throughout the Middle Ages, so much so that "Priscian" came to be synonymous with the science of Latin grammar. Its obscurities were explained in Carolingian written commentaries and, as part of the university arts course, in oral lectures. The full work survives in hundreds of manuscripts and in more than 1,000 abridgements. Dante placed Priscian among the "violent against nature" (*Inferno*, 15.109), but it is unclear whether the intended offense was sexual sodomy; a condemnation of Priscian's theoretical, Greek-derived approach to language seems more likely.

Procopius of Caesarea

Procopius (c. 500-C.561) was born and classically educated in Palestine. In 527 he became a legal adviser and secretary to the rising young general Belisarius, and he served with Belisarius in campaigns against the Persians, the Vandals in North Africa, and the Ostrogoths in Italy. After returning to Constantinople in 540, Procopius held several civil offices and began writing a series of historical works in Greek that have won him recognition as the last of the great historians in the classical tradition. Little is known of his final years, but he is understood to have died before his sovereign, Emperor Justinian.

The historical work of Procopius is in ten parts. The first eight "books" are collectively known as *History of the Wars*, in turn subdivided by military theater. Books 1 and 2 are known as *The Persian Wars* and cover events in the east into the 550s. Books 3 and 4, *The Vandalic Wars*, describe Belisarius's lightning campaign in North Africa

(533-534) and extend to the subsequent pacification program there into the late 540s. Books 5-8 treat the Gothic wars against the Ostrogoths in Italy. In this group, Book 7 carries the narrative to 550, and, along with its predecessors, was circulated in 551; Book 8, a supplement covering events on several fronts through 552 (notably the final defeat of the Ostrogoths under Narses), was completed and circulated in the years that followed. The author's style throughout is in the grand manner of military, diplomatic, and political history; the work is superbly written and authoritatively detailed, reflecting either the author's personal participation or his access to the best contemporary information. Occasionally there is mild criticism of Justinian, but the general tone is that of an official history.

The other two works by Procopius are less securely dated and more problematic in character. *Anecdota (Unpublished Sections)*, known as *The Secret History*, was intended for limited circulation, if not for the author's desk drawer only. Sensational and often hysterical in tone, the work is a vindictive diatribe aimed at Belisarius, Theodora, and Justinian himself. *The Secret History*, which was once thought spurious, offers important information and perspectives if used critically. The other work is a panegyric, *On the Buildings*, a survey of Justinian's far-flung architectural program. It was intended to cover the entire empire but, apparently incomplete in its final form, omits Italy. Its tone of slavish adulation for Justinian is repugnant, but it contains much information of value. *The Secret History* has been thought to represent the bitter disillusionment of Procopius's last years, whereas *On the Buildings* was written to ingratiate the author with the court after some loss of favor; but it has also been argued that these two "supplemental" works were joined with the rest in a coherent grand design.

Prodenzani, Simone

Simone Prodenzani (c. 1360-c. 1440) was born in Prodo and died in Orvieto. He was the author of *Liber saporecti* (*Il saporetto*) and *Liber solatii* (*Il sollazzo*), both composed between 1400 and 1422. *Il saporetto* is a poem consisting of 186 sonnets and is divided into four parts or *mondi*. In the first two parts—*Mundus placitus* and *Mundus blandus*—the poet gives a detailed description of banquets, dances, concerts, and other ludic activities of the bourgeoisie and of the nobility in the late fourteenth century and the early fifteenth century. Parts 3 and 4—*Mundus tranquillus* and *Mundus meritorius*—are a discussion of moral, religious, and philosophical issues based on traditional sources: Aristotle, Saint Augustine, Boethius, Saint Thomas Aquinas, and Dante. Less interesting than the festive *mondi*, they nevertheless demonstrate that Prodenzani was a cultivated individual whose middlebrow philosophy reflected the concerns and attitudes of a broad audience of Orvietani. The *Mundus placitus* and the *Mundus blandus* are another matter. Here, as a prominent figure in city politics between 1387 and the time of his death, Prodenzani documents the customs of the privileged class. For modern scholars, the first two *mondi* are an indispensable

store of linguistic and cultural information about the period.

At the outset of the narrative, Buonare (Proenzani) dreams that he has sent his son, Sollazzo (a talented entertainer whose name means "jester"), to a nobleman, Pierbaldo, lord of the fictional land of Buongoverno. Buonare's son participates in the Christmas festivities at Pierbaldo's court. The mountebank becomes the life of the party when he recites *Il sollazzo*, a collection of eighteen novellas in *ballata* form, similar to the French fabliaux. According to Debenedetti (1913, 96), *Il sollazzo* was the first collection of novellas in Italian literature to be set to poetry. The novellas are *exempla* of moral retribution, many of which feature women as sinful antagonists. Although the tales are taken primarily from the oral tradition, two of them are adapted from Boccaccio's *Decameron*. The ninth novella of *Il sollazzo*, dealing with the theme of hypocrisy, is similar to the tale of the promiscuous abbess (*Decameron*, 9.2); the eleventh, which is about vanity, recalls the *novella* of Andreuccio da Perugia (2.5). *Il sollazzo* is a showcase for Prodenzani's wit and ability to create unique characters and comic situations that are similar to those of Antonio Pucci and Franco Sacchetti (Andrioli Nemola 1979, 108).

Scholars have examined the relationship between these poems. Because the very popular *Sollazzo* is the high point of the *Saporetto*, the latter has been seen as the frame of the jester's narrative. According to Debenedetti (p. 33), Prodenzani selected eighteen tales written in his youth and integrated them into the structure of *Il saporetto*, which was probably composed after *Il sollazzo*. Debenedetti also believes that the poet added the moralizing *Mundus tranquillus* and *Mundus meritorius* in order to give his work aesthetic and moral unity. However, *Il sollazzo* is transcribed before *Il saporetto* in the most authoritative manuscript of the poems, manuscript 286 of the Biblioteca Palatina of Parma. Given the documentary evidence, Andrioli Nemola (p. 222) considers *Il sollazzo* and *Il saporetto* autonomous works that are connected by important figurative elements, such as the protagonist-narrator Sollazzo, and by Prodenzani's ideological perspective.

Besides *Il saporetto* and *Il sollazzo*, Prodenzani also composed twenty-one *rime*.

Prosdocimus de Beldemandis

Prosdocimus de Beldemandis (Prosdocimo de' Beldomandi, d. 1428), was the author of treatises on arithmetic, geometry, astronomy, and music. After studying in Bologna, he took a doctorate in arts at Padua on 15 May 1409 and received a license in medicine there on 15 April 1411. He was a professor of arts and medicine at Padua from 1422, at the latest, until his death.

Prosdocimus wrote on all four of the quadrivial arts; the following

treatises have survived. On arithmetic: *Canon in quo docetur modus componendi et operandi tabulam quandam* (Padua, 1409 or 1419) and *Algorismus de integris sive pratica arismetrice de integris* (Padua, 1410). On geometry: *De parallelogramo*. On astronomy: *Brevis tractatulus de electionibus secundum situm lune in suis 28 mansionibus* (Montagnana, 1413); *Scriptum super tractatu de spera Johannis de Sacrobosco* (Padua, 1418); *Canones de motibus corporum supercelestium* (Padua, 1424); *Tabule mediorum motuum, equationum, stationum et latitudinum planetarum, elevationis signorum, diversitatis aspectus lune, mediarum coniunctionum et oppositionum lunarium, feriarum, latitudinum climatum, longitudinum et latitudinum civitatum; Stelle fixe verificate tempore Alphonsi; Canon ad inveniendum tempus introitus solis in quodcumque 12 signorum in zodiaco; Canon ad inveniendum introitum lune in quolibet signorum in zodiaco; Compositio astrolabii; and Astrolabium*. On music: *Expositiones tractatus practice cantus mensurabilis Johannis de Muris* (Padua, possibly 1404); *Tractatus practice cantus mensurabilis* (1408); *Brevis summula pro-portionum quantum ad musicam pertinet* (1409); *Contrapunctus* (Montagnana, 1412); *Tractatus practice cantus mensurabilis ad modum Ytalicorum* (Montagnana, 1412); *Tractatus plane musice* (Montagnana, 1412); *Parvus tractatulus de modo monacordum dividendi* (Padua, 1413); and *Tractatus musice speculative* (1425).

Prosdocimus based his *Algorismus de integris* on a similarly titled work of the thirteenth-century polymath Johannes de Sacrobosco; his *Scriptum super tractatu de spera Johannis de Sacrobosco* is based on the same author's textbook of Ptolemaic astronomy, one of the most widely disseminated medieval astronomical works.

Prosdocimus's musical treatises represent an attempt to survey the entire discipline; no earlier music theorist had attempted such a comprehensive project through separate treatises on the subdisciplines, and Prosdocimus's musical writings are of great importance because of their scope and clarity. In *Parvus tractatulus de modo monacordum dividendi*, he described a scale that preserved the standard medieval "Pythagorean" tuning (i.e., with pure perfect fifths, slightly wider than those of present-day equal temperament) but with seventeen notes to the octave (seven naturals, five flats, and five sharps not quite in tune

with the flats); this expanded scale may have been an important step toward the tempered tunings of the later fifteenth century. In *Contrapunctus*, he confirmed that medieval scribes did not write all the accidentals they necessarily expected to be performed, and he gave rules that clarify where accidentals are appropriate, even if unwritten. He surveyed the theory of rhythmic mensuration in three treatises, *Expositiones tractatus prattice cantus mensurabilis Johannis de Muris* (a commentary on the *Libellus cantus mensurabilis*, the most widely disseminated medieval treatise on mensuration, which laid the foundation for French fourteenth-century rhythmic notation); *Tractatus prattice cantus mensurabilis*, his own account of fourteenth-century French mensuration; and *Tractatus prattice cantus mensurabilis ad rnodum Ytalicorum*, an exposition of contemporaneous Italian mensuration (this is the most comprehensive treatment of Italian mensuration in its mature stage). *Tractatus musice speculative* is an attack on the division of the tone into fifths described a century earlier by Marchetto da Padova, based on what Prosdocimus saw as the earlier theorist's abandonment of "Pythagorean" tuning and his faulty logic.

The manuscript Florence, Biblioteca Medicea-Laurenziana, Ashburnham 206, written by Prosdocimus in 1409, is an anthology of the curriculum of the Paduan college of arts and medicine at the time. It includes the *Algorismus de integris* of Johannes de Sacrobosco, the *Algorismus de integris* of Johannes de Lineriis, the *Canones supra tabulas Alphonsi* and the *Scriptum super Alkabicium* of Johannes de Saxonia, the *De septem planetis* of Messahala, the *Tractatus quadrantis novi* and the *Canones de almanack perpetuum* of Profatius Judaeus, and the *De prognosticatione mortis et vite secundum motum lune* of Pseudo-Hippocrates, among shorter works on arithmetic, astronomy, and astrology and several compilations of medical prescriptions.

Proverbs

The word *proverbi* in medieval Italy has three connotations: (1) references to the Book of Solomon, a collection of wise aphorisms probably assembled between the fourth and eighth centuries after Christ; (2) short, witty sayings of popular origin; and (3) pithy observations created by a single, identifiable author after the manner of folk proverbs.

The Cremonese notary Girard Pateg (fl. 1228) left a somewhat dry poem in alexandrine rhymes, *Splanamento de li Proverbi di Salamone* (*Explanation of the Proverbs of Solomon*). The author explicitly states that this gloss was written for the edification of the masses. Topics include the tongue (speech), pride, anger, humility, the choice of a good wife, friendship, and riches versus poverty. Dante also referred to *li Proverbi di Salomone* in his *Convivio* (3.11.12).

The second connotation of "proverb" is most common: a folkloric source of knowledge that parallels written forms produced by cultural institutions such as the church and the university. All cultures produce their own proverbs, terse distillations of experience that address natural, social, psychological, and even political situations. The production of proverbs in Italy was particularly rich, owing to its multiple and enduring dialects. Relatively recently, there has been an explosion of regional scholarship on proverbs, studies too numerous to list here.

Italian proverbs can be documented in the thirteenth century, and their production continued throughout the Middle Ages. A noteworthy rhymed text by Garzo (c. 1225), perhaps an ancestor of Petrarch,

contains 240 proverbs, in alphabetical groups of twelve. One early fourteenth-century codex in Piedmontese dialect conserves allegorical and moralizing proverbs about nature, flora, and fauna. The use of proverbial expressions in a written text indicates a popular audience or readership. Learned authors may also use proverbs ironically, in humorous shifts to a lower register, or in an insulting manner to characterize a person as *villano*, of the lower classes.

Proverbs appear in a wide range of texts and genres, in verse and prose. Early poets such as Guido Guinizzelli, Monte Andrea, Chiaro Davanzati, Cecco Angiolieri, and Fazio degli Uberti mention or cite proverbs. Giovanni Boccaccio, Ser Giovanni Fiorentino, and Franco Sacchetti include proverbs in the respective *novelle* of the *Decameron*, *Il pecorone*, and *Il trecentonovelle*. Popular religious authors such as Fra Giordano, Domenico Cavalca, and pseudo-Bonaventura refer to the potentially harmful nature of these often sharp-tongued sayings and look askance at their sometimes negative moral content. The fifteenth-century Tuscans Andrea da Barberino and Luigi Pulci explicitly cited proverbs in their long chivalric narratives.

Prudentius

Prudentius (Aurelius Prudentius Clemens, 348-after 404) was born a Christian, was classically educated, became a Roman lawyer and government magistrate, and then abandoned his administrative career to dedicate himself to poetry. His work combines classical form and Christian spirit, making him, for many medieval readers, the archetypal Christian Latin poet.

Prudentius produced a large body of work including hymns, short lyrics, and long poems in hexameter. His better-known works include the following: *Peristephanon* (*Crowns of Martyrdom*), fourteen hymns honoring Christian martyrs in a variety of meters; *Cathemerinon* (*Hymns for the Day* or *The Daily Round*), twelve hymns to be sung throughout the day and on Christian holidays; *Hamartigenia* (*The Origin of Sin*), which examines, in hexameter, man's responsibility for his sinfulness; *Contra Symmachum*, two books of hexameter presenting a polemic against paganism; and *Psychomachia*, which depicts the struggle between virtue and vice in an innovative combination of allegory and epic style.

The hymns enjoyed enormous popularity throughout the Middle Ages and were used for centuries in church liturgy. Although they borrow meters found in Horace's *Odes*, they never waver from their firmly Christian perspective. *Contra Symmachum*, too, proved influential, particularly for its vision of classical culture as a vehicle for, rather than a rival of, Christianity. Medieval readers responded to

Prudentius's contention that the Christian God willed Rome's conquests in order to enable the diffusion of Christianity through a politically unified empire.

Psychomachia, however, was Prudentius's greatest success. In this hexametric poem, personifications of the virtues and vices struggle for control over man's soul. The virtues and vices behave like epic heroes, performing extraordinary acts of strength and violence. Faith strangles Idolatry, Humility beheads Arrogance, Chastity slaughters Lust. Prudentius crafts battle scenes which read like passages from Homer or Virgil, but he raises the stakes of the conflict: the outcome of the strife will be the salvation or damnation of man's soul. He infuses classical epic with the gravity of Christian belief and thus provides a place for pagan poetics in the literary life of Christianity.

The *Psychomachia* served as a forceful stimulus to the development of allegorical poetry. The nearly iconographic portraits of the allegorized virtues and vices also made their presence felt in the visual arts, where representations of these abstractions became popular subjects in the Middle Ages.

Ptolemy of Lucca

Ptolemy Fiadoni of Lucca (Tolomeo, Tholomeo, Ptolomeo, Bartolomeo; c. 1236-1327) was a member of a family that belonged to the Lucchese commercial elite, though not the aristocracy. He entered the Dominican convent of San Romano at Lucca at an unknown date, but obviously before he accompanied Thomas Aquinas on a journey from Rome to Naples in 1272. He remained in Rome with Aquinas until 1274, probably helping him set up a *stadium* of theology in the Neapolitan

convent of San Domenico. Ptolemy included a long account of Aquinas's life and works in his *Historia ecclesiastica nova*. Ptolemy may also have visited or lived in Rome during the time of Pope Nicholas III (r. 1278-1280), since his *Historia ecclesiastica* contains interesting descriptions of Nicholas's building projects. *Libellus de iurisdictione imperii et auctoritate summi pontificis* (usually called *Determinatio compendiosa*), written at about this period, seems to breathe the spirit of Nicholas's pontificate. In 1283-1285 Ptolemy visited Provence. In 1285 he was made prior of San Romano in Lucca. In 1288 he was named preacher-general of his order and attended its general chapter in Lucca; he was a *diffinitor* at the general chapters of 1300 at Marseilles and of 1302 at Cologne. During the years 1287-1307 there are frequent documentary references to his presence in the Lucchese convent, often as prior; he was also (from 1300 to 1302) prior of Santa Maria Novella in Florence. During this period he made other trips outside Lucca; for example, Ptolemy witnessed the election of Celestine V at Perugia and his crowning at Aquila and was in Naples during his pontificate in 1294. Ptolemy was in Avignon by 1309 and spent most of the next two decades there, serving at least two cardinals. He was named bishop of Torceilo in 1318. Because of a quarrel with the patriarch of Grado, Ptolemy's episcopate was stormy, and he even suffered excommunication and imprisonment. Pope John XXII restored Ptolemy to his see in 1323, probably while the pope was in Avignon attending the festivities for Aquinas's canonization. Ptolemy died in Torceilo.

Though he wrote one "scientific" work, *De operibus sex dierum*, published under the title *Exaerneron*, Ptolemy's achievements as a historian and political thinker far outweighed those in philosophy or theology. Besides his *Historia ecclesiastica nova*, which is based not only on Martin of Troppau and other chroniclers but also on numerous canonistic texts, Ptolemy wrote *Gesta Tuscorum*, a volume of annals extending from 1061 to 1303 in which Tuscany and particularly Lucca figured prominently. Ptolemy refers also to a third historical work, *Historia tripartita*, of which no manuscript is known. His desire to exalt the temporal jurisdiction of the papacy found expression in his *Libellas de iurisdictione imperii et auctoritate summi pontificis*, published as *Determinatio compendiosa de iurisdictione imperii*; and *Tractatus de*

iurisdictione ecclesie super regnum Apulie et Sicilie. Krammer, who edited *Determinatio compendiosa* (1909), also edited *De origine ac translatione et statu romani imperii* as a work probably by Ptolemy, but its authorship is uncertain. In about 1302 Ptolemy wrote his continuation of Aquinas's *De regno*; this composite work has usually been referred to as *De regimine principum* and attributed solely to Aquinas. In Ptolemy's continuation, another dimension of his political thought came to the fore: his republicanism. He arranged governments under two main headings, political and despotic, classifying aristocracies and popular governments as political and all forms of absolute rule, including kingship, as despotic. Ptolemy depended heavily on Aristotle's *Politics*, but Aristotle had drawn a sharp distinction between despotic and royal government—a distinction of which Ptolemy shows himself to be well aware in his *De operibus*. Ptolemy's preference for political government was revealed in his claim that this was the regime best suited for inhabitants of Eden, northern Italy, and Rome. In *De operibus* he said that in the state of innocence government would have been, as it was today among the angels, not despotic but political, a prelacy based on service, not a dominion involving subjection—subjection having come about only as a result of the fall of man. In *De regimine principum* he said that this was also true of northern Italy and Rome, whose inhabitants took pride in their own rationality, though it was not true of the majority of other postlapsarian men, who usually profited more from royal rule. Ptolemy tried to reconcile this view with the frequency of despotism in contemporary Italy by saying that northern Italians could be subjected only by coercion. As for the Roman empire, not it but the church was the legitimate heir of the Roman republic. The virtues of the heroes of the Roman republic, to which Ptolemy also alluded in *Determinatio compendiosa*, recalled, in fact, the pristine state of human nature before the fall of man. Ptolemy's attempt to justify and harmonize republican and hierocratic theories makes him one of the most original political thinkers of the Middle Ages.

Quilichino of Spoleto

Very little is known about Quilichino (early thirteenth century), the author of *Historia Alexandri Magni* (*History of Alexander the Great*), a Latin poem in 1957 elegiac distichs written in 1236 and revised in the course of the following year. Even his name is uncertain: all vernacular forms are modern-language versions of the attested medieval Latin, conventionally given as Quilichinus but more likely to have been Vilichinus (and in either case accented on the second syllable). Quilichino tells us that he is a judge, that his family is of Spoleto, that he is a partisan of the emperor Frederick II, and that he has elsewhere written praises (*precoma*) of Frederick. These praises appear to be lost; during the early twentieth century they were identified with an eighty-line Latin poem to Frederick usually ascribed to Terrisio of Atina, but that theory is no longer widely accepted. Nor (the Library of Congress to the contrary notwithstanding) is Quilichino in any way responsible for the early fourteenth-century *Pomerium rethorice* (*Orchard of Rhetoric*) of the somewhat similarly named dictaminal writer Bichilino of Spello.

Quilichino's poem closely follows one version (J³) of the so-called *Historia de preliis*, a catchall term for reworkings of the archpriest Leo's Latin rendering of the Greek romance of Alexander. However, Quilichino divides his account into four books in a way that emphasizes Alexander's several kingships and so suggests a parallel with Frederick, king of Germany, Italy, and Sicily. Its general lack of stylistic polish is

relieved in places by phrasing adapted from the poetry of Boethius. As a morally informed piece of versified history, it enjoyed some success. At least twenty manuscripts are known, four from the fourteenth century and the rest later. There are also an early fourteenth-century Italian translation in ottava rima by Domenico Scolari and a late fourteenth-century German verse translation known as the Wernigerode *Alexander*.

Quintilian, Marcus Fabius

Quintilian (c. A.D. 30-96), a Roman lawyer and orator, earned lasting fame as a teacher of rhetoric. His most significant and only surviving work, *Institutio oratoria*, is dedicated to the education of the orator. The book defines the orator as a civic leader; and when Quintilian describes rhetoric as "a knowledge of speaking well" (*bene dicendi scientia*), the term *bene* implies both moral excellence and artistic mastery (Kennedy 1980, 101). In *Institutio oratoria*, Quintilian argues that instruction in rhetoric must be part of a comprehensive educational plan, beginning with a child's nurse, moving through literature, and concluding with the rhetorical art. The vast scope of the book and the educational plan it advocates diminished its utility in late antiquity, a time when academic horizons were narrowing, and it fell into disuse.

Nevertheless, Quintilian's influence was funneled to the Middle Ages through several indirect sources. Cassiodorus, whose *Institutiones divinarum et humanarum lectionum* served as a fundamental textbook in medieval monastic education, cites Quintilian, along with Cicero, Augustine, Martianus Capella, and others, in his brief passage on rhetoric. Caius Julius Victor, another late Roman professor of rhetoric, also relied on Quintilian. The Carolingian reform of the ninth and tenth centuries initiated a renewal of interest in *Institutio oratoria*.

Quintilian, *Oratoriarum Institutionum*. Cologne: Eucharius Cervicornus, 1527. Reproduced by courtesy of Department of Special Collections, General Library System, University of Wisconsin-Madison.

At least one manuscript tradition of the complete *Institutio oratoria* circulated in the British Isles throughout the Middle Ages. The *Recensio Ambrosiana* (*Ambrosian Edition*) of the work was also available to a few writers in Tours, including John of Salisbury. More widely disseminated was the incomplete *Recensio Berne* (*Bern Edition*), known in continental Europe. Despite its mutilated state, this book inspired

interest at Chartres in the twelfth century and had a particular influence on debates concerning the education of children. Dante gives no indication of knowing Quintilian; and Boccaccio mentions the author of *Institutio oratoria* only in proverbial form, noting that Frate Cipolla's eloquence (*Decameron*, 6.10) inspired comparisons with "Tulio" (i.e., Cicero) or perhaps "Quintiliano."

The *Recensio Ambrosiana* was recovered on the continent by Poggio Bracciolini in 1415. He describes the manuscript in dramatic terms: long languishing deep in the dungeons of Saint Gall, "his face cruelly torn—his ears wrenched from despoiled brows, and his nostrils lopped by a shameful wound" (*Aeneid*, 6.495-497, trans. Fairclough). The restored text became an essential work for the humanists, influencing both educational theory and the theory and practice of rhetoric.

Quirini, Giovanni

Little is known about the poet Giovanni Quirini (fourteenth century) except that he was a Venetian nobleman and merchant and his family

was exiled in 1310. Fortunately, the substantial corpus of his poems has been handed down to us in an authoritative manuscript, Latino XIV.223 of the Biblioteca Marciana of Venice. According to Morpurgo (1894, 135), the 106 poems contained in the codex were copied from an autograph manuscript.

As an imitator of Dante and of the *dolce stil nuovo*, Quirini often speaks about love in his poetry—although he seems to have undergone a spiritual conversion, because many of the compositions also deal with religious themes. His poetry incorporates Tuscan linguistic forms and *stilnuovo* motifs in Venetian language. Hence, his poetry bears witness to the rapid spread and assimilation of Florentine poetry in northern Italy, and particularly in the Veneto. He praises Dante and the *Commedia* in the sonnet *Com'egli errò ne la fede cristiana* ("As he erred in the Christian faith"): *ispredor e lume, fonte e rioldel belparlar della lingua nostrana* ("splendor and light, fount and stream of the lovely speech of our language" (verses 7-8). Unlike Dante's contemporaries who were primarily concerned with the doctrine in the *Commedia*, Quirini underscores the work's linguistic importance (Corsi 1969, 41n).

Quirini's *dantismo* is manifest in many of his sonnets, in particular *Se per alcun puro omo avvenne mai* ("If because of a simple man it ever happened"), a poem sent to Cangrande della Scala. In this poem, Quirini laments the death of Dante, saying that it should be made known to the world by more eventful and foreboding signs than the solar and lunar eclipses that occurred at the death of a "simple" man (a reference to Christ).

At their best, Quirini's poems have sincerity of expression and lively imagery. In the sonnet *Colui cheperse la figura umana* ("The one who lost his human form"), Quirini combines graphic language (*Amor ... /mi squatra e rode il cor cun ambidue/quel vostri ladri che lume mi fanno*: "Love . . . tears me apart and devours my heart with both of your thieves [i.e., the woman's eyes] that shine on me") and fluid syntax in order to create a concise representation of his emotional state. In another sonnet, *Ora che 'l mondo se adorna e se veste* ("Now that the world adorns and clothes itself"), he resuscitates the topos of spring, describing nature's beauty and the joy it brings. This *plazer* ends with the hope, and perhaps a plea, that his lover will serve him well.

Quirini also composed devotional poetry characterized by liturgical

formulas and a simple musicality that enlivens the religious themes.

R

Rabanus Maurus

Rabanus Maurus (c. 780-856) was a teacher, scholar, writer, and active churchman whose career reflects the Carolingian renaissance. He was born at Mainz, and as a boy he became an oblate at the monastery of Fulda. In 802, he was sent briefly to Charlemagne's court and then to Tours to study with Alcuin, who was the leading figure in shaping Charlemagne's program to revive education and learning. Rabanus returned to Fulda before 804, became master of the monastic school, and then in 822 became the abbot. As abbot, he not only promoted the monastic school, library, and *scriptorium* but also built churches, carried on pastoral work, and managed the abbey's extensive properties. As a consequence, Fulda grew to be a major center of learning in the Frankish world and constitutes a case study of the nurture of learning in local centers remote from the Carolingian court. Rabanus was a supporter of Louis I the Pious and Louis's eldest son, Lothair (Lothar) I, as representatives of the ideal of imperial unity, a position that cost him his abbacy in 842 during the fraternal struggles following the death of Louis in 840. In 847 Rabanus was elected archbishop of Mainz, and until his death he utilized that office to promote church reform, defend doctrinal orthodoxy, and support missionary activity.

Rabanus was i he most prolific of all Carolingian writers. He produced a huge body of literary works in many forms: scriptural commentaries, basic textbooks on the liberal arts (*De arte grammatica* and *De computo*), penitentials, collections of sermons, a martyrology, poems, and letters, some of which reflected his views on current political and theological issues. Perhaps his most influential works were *De institutione clericorum*, a manual for priests dealing with the nature and exercise of their office and with the education required to prepare them for their duties; and *De rerum naturis*, an encyclopedia seeking to provide the basic knowledge required to read and interpret scripture in

a spiritually fruitful way.

Rabanus's literary works are primarily compilations drawn from earlier writers, and so he has received little credit as an original thinker among modern scholars. However, this evaluation misses the inspiration that guided his intellectual, literary, and pastoral career. Deeply imbued with the fundamental concept guiding the Carolingian renaissance, Rabanus believed that the challenge facing his age was the recovery in usable form of the basic wisdom that defined the true Christian religion. This wisdom—enshrined in scripture, the vast body of Latin patristic writing, and even Latin pagan literature—needed to be sorted out and organized so that it could be learned and applied by his contemporaries. To what was essentially a pedagogical task, Rabanus brought considerable talent: extensive learning, a sense of essentials, skill as an organizer of borrowed materials into straightforward works of instruction, and an ability to adapt received knowledge to new situations. His corpus of writings indicates one of the major accomplishments of the Carolingian renaissance: the reestablishment of fruitful contact with a rich and complex tradition. For his contribution to the Carolingian revival of learning, he perhaps deserves a title given him by modern scholars, *preceptor Germaniae*.

Radagaisus

Radagaisus (d. 406) was a pagan Goth who crossed the Danube and invaded Italy in 405-406. He met with little resistance there, and he had forced the city of Florence to the point of surrender when the Roman regent Stilicho arrived with relief troops. Stilicho forced Radagaisus and his army to withdraw from Florence to Fiesole and then cut off their supply line. Consequently, Radagaisus was starved into submission. When Radagaisus tried to abandon his soldiers, he was captured by the Romans and executed outside the gates of Florence on 23 August.

Raimbaut De Vaqueiras

The troubadour Raimbaut de Vaqueiras (c. 1155or 1160-1207) was born in Vacqueyras, near Orange in Provence, and probably died near Messinople in Thrace (northern Greece). He was of lowly origins and soon adopted the profession of jongleur. Since during this period the courts of Provence were somewhat lukewarm in their patronage of

poets, he tried his luck on the other side of the Alps, where the lords of Montferrat, Malaspina, and Este were vying with each other to welcome troubadours and jongleurs. In particular, the brilliant court of Montferrat, where Raimbaut arrived in the 1180s, was very hospitable to exponents of the new poetry; and he soon formed a bond of sympathy with the marquis's third son, Boniface, who was about his age. In due course this ripened into one of the most intimate and affectionate associations ever recorded between a poet and his patron, which was not severed until Boniface's tragic death in 1207. Before reaching Montferrat, Raimbaut had been forced to wander, on foot and hungry, across the plains of Lombardy, as he recalled in a famous *tenso* with another troubadour, Albert of Malaspina. Afterward, as a close friend of the marquis, Raimbaut fought valiantly alongside his patron on several occasions and was instrumental in saving Boniface's life during a Sicilian campaign of 1194 for Emperor Henry VI, a feat that earned him a knighthood. In the spring of 1203, Raimbaut went on the Fourth Crusade, joined the marquis and the Venetians on their way to Constantinople, and was wounded during the ensuing siege. After the conquest of Constantinople in 1204, Raimbaut accompanied Boniface on a campaign in Greece; later he participated in the activities of Boniface's court at Salonika. Raimbaut very likely died with his friend during Boniface's ill-advised incursion into the Rhodope Mountains, on 4 September 1207.

Raimbaut left twenty-six poems, of which eight are preserved with musical notation. His multilingual *descort* is particularly famous: one stanza is in Occitan, another in Italian, a third in French, a fourth in a kind of Gascon, a fifth in a type of Gallician-Portuguese, and a sixth in a combination of the five languages, each having two lines. The lyric-epic composition called *Carros*, which described an imaginary war of merit, beauty, and youth between his patroness—Boniface's sister Beatrice—and a band of more than twenty ladies of the Italian nobility, is no less famous and is one of the jewels of Occitan literature. Another fine composition, completed in 1205 in Greece, is his *Epic Letter* (its modern title). This work is unique in the Romance literatures of the twelfth and thirteenth centuries: it consists of three poems rhyming *-at*, *-o*, and *-ar* and contains a request to the marquis for material compensation for his services, concomitantly serving as an

autobiography.

Rainulf, Count of Aversa

Rainulf (Ranull Drengo, died c. 1045) was the leader of a band of Norman mercenaries who would establish the first permanent Norman principality at Aversa. Having landed in southern Italy with his

brothers in 1016, Rainulf eventually placed himself and his followers at the service of various Lombard princes who in one way or another were determined to expand their principalities at the expense of the Byzantine empire, which maintained more than a nominal control over the south. At some point, Rainulf placed himself at the service of Pandulf IV, prince of Capua, who, taking advantage of the death of Guaimar IV of Salerno and the minority of Guaimar V, proceeded in 1027 to take over Naples and remove the ruling duke, Sergius IV (d. 1037). Later, Rainulf, having married the sister of Duke Sergius, helped Sergius to regain Naples. For this service, in 1029, Rainulf was granted the village of Aversa; when fortified, it became a strong defensive outpost for Naples and also the base for the *Normans'* expansion in southern Italy, a rallying point for incoming Normans seeking employment as mercenaries.

After the death of his first wife, Rainulf married the niece of Pandulf IV of Capua and thus returned to the service of Pandulf. But when Conrad II (r. 1024-1039) moved southward to rearrange the political order there, Rainulf once again switched allegiance, giving his support to the prince of Salerno, Guaimar V. In 1038, Conrad recognized Guaimar as prince of Salerno and Capua and invested Rainulf as count of Aversa. Rainulf assisted Guaimar in the conquest of Amalfi in 1039 and Gaeta in 1040. In the campaigns against the Byzantines, the Normans fought alongside the Lombards, and although the Normans were still only allied mercenaries, they were responsible for a series of victories. The Normans would eventually assume the leadership of the Apulian revolt, but Rainulf himself died in June of 1044 or 1045.

Rangerius of Lucca

Rangerius (d. 1112) was bishop of Lucca from c. 1096 until his death. He was a talented literary writer in Latin and a vigorous champion of the Gregorian reform. His life before August 1097, when he first appears in the Luccese charters, is a mystery: his nationality (perhaps French), his training, his possible monastic vocation, and even the date of his election as bishop are all controversial. Most of our evidence for Rangerius is derived from his two surviving poems, whose considerable stylistic merits have commanded far less attention than their utility as historical sources.

Vita metrica s. Anselmi lucensis episcopi (*Metrical Life of Saint Anselm, Bishop of Lucca*) was presumably written between 1096 and 1099. It is an elegant treatment, in 3,650 elegiac distichs, of the life and deeds of Rangerius's recent but not immediate predecessor, the reforming bishop Anselm of Lucca; and it is valuable as a document of the ecclesiastical history of Lucca and also for the light it sheds on attitudes toward the role of the church in late eleventh-century Luccese society. *De anulo et baculo* (*On the Ring and the Staff*) was seemingly written in late 1110; it is in 530 elegiac distichs and constitutes a reply to a recent treatise upholding imperial rights in the investiture of bishops. In this work, Rangerius focuses mainly on the sacramental nature of the staff and the ring presented during the investiture ceremony and offers an eloquent affirmation of the freedom of the church from lay (and especially royal) interference. According to Donizo of Canossa, who quotes verses that are absent from the text as transmitted, the poem was dedicated to Matilda of Tuscany; but as we have it now, it is addressed to the papal chancellor John of Gaeta (the future Pope Gelasius II).

At least two prose writings have also been ascribed to Rangerius: a sermon on the translation, in 1109, of the remains of the martyrs Regulus, Jason, Maurus, and Hilaria; and a sermon on the dedication of the church of Saint Martin (Lucca's cathedral, dedicated 6 October

1070). The first sermon, whose most authoritative form has been edited only in part, is probably Rangerius's work and has been accepted as such by at least one relatively recent scholar; the other attribution, however, has found little support.

Ratchis

Ratchis was a king of the Lombards (r. 744-749). He had been made duke of Friuli, succeeding his father, Pemmo, by King Liutprand. In 744, Ratchis overthrew Liutprand's successor, Hildeprand. As king, Ratchis inherited the strong realm created by Liutprand, and he continued Liutprand's policy of expansion at the expense of the empire. Although Ratchis was successful in a number of projects, he faced an increasingly serious situation as the popes succeeded in breaking a long-lasting friendship and cooperation between the Lombards and the Franks, and the Lombard dukes became increasingly restive under strong royal control. Ratchis was overthrown by his brother Aistulf in 749, whereupon Ratchis retired to the monastery of Monte Cassino. He emerged briefly in 756 in an unsuccessful attempt to regain the throne.

Ratherius of Verona

Ratherius, bishop of Verona (Rather of Luttich, c. 887 or 888-974), was born in Germany. In 926 he went to Italy, where he found favor with Hugh of Aries, who, in addition to his Provençal holdings, had just become king of Italy. Ratherius became bishop of Verona in 931. Unfortunately, he sided with Arnulf of Bavaria when Arnulf invaded Italy in 934. Hugh defeated Arnulf and imprisoned Ratherius for two and a half years.

Ratherius wrote his greatest work, *Praeloqua*, in prison, as a guide for those beset by suffering. His contemporary Liudprand of Cremona praised it, but some modern critics believe it is marred by self-pity.

Ravenna

History

Ravenna is strategically situated along the land corridor of eastern Emilia between the Po valley and the Via Flaminia as it passes southward through the great barrier of the Apennines; thus the city commanded the historic passage between old Cisalpine Gaul and Italy proper. It could be made virtually impregnable because it was erected in the tidal marshes inward from the Adriatic shore—"built entirely on piles, and traversed by canals which you cross by ferryboats," as the Greek geographer Strabo (first century B.C.) describes it, almost anticipating Cassiodorus's depiction of the Venetian lagoon. Ravenna was the southernmost base of Julius Caesar's proconsular realm, and from it he marched south to cross the boundary of his province, the Rubicon River, to confront the senate in 49 B.C. Octavian (Augustus)—recognizing the needs of the Roman navy, and appreciating Ravenna's location—used it as a maritime base during the civil wars and then created the new port of Classis ("Fleet"), more than 2 miles (3 kilometers) southeast of the town, as one of the empire's major naval stations. Between Classis and Ravenna proper a suburb known as Caesarea developed.

Through the early history of the empire, Ravenna apparently grew and prospered. Christianity is said to have come to it as early as the first century after Christ, and tradition holds that Saint Apollinaris, a Syrian-born disciple of the apostle Peter, became its first bishop (and possible martyr). A later bishop, Ursus (r. 370-c. 396), is credited with building the first Christian church in Ravenna (c. 385). Though Ravenna played a role in the recurrent military crises of the second and third centuries, its facilities may have already begun to decay, as its shore silted up. However, its decline, if any, would have been suddenly arrested in 402, when the young Theodosian emperor Honorius (r. 395-423) decided to transfer his court to Ravenna from Milan, which was then the imperial capital. This step has been explained as resulting from Honorius's sense of vulnerability at the time of Alaric's entry into

Italy, but it also very sensibly took into account the comparative security and defensibility of Ravenna as a seat of government. Thus, in the confusion following the fall of Stilicho in 408, and despite the collapse of military organization that allowed Alaric's rampage through Italy and his symbolically devastating sack of Rome in 410, Ravenna remained the inviolate governmental center from which order could be reestablished.

Another of Ravenna's assets was its immediate access to the Adriatic as a route of possible aid from the eastern court of Constantinople. Its value was demonstrated when an eastern force was sent to depose a usurper who had seized power after Honorius died childless, and to establish as his successor his young nephew, Valentinian III (r. 425-455). Valentinian, though, was a worthless prince, whose mother, Galla Placidia (Honorius's sister), was the actual ruler until her death in 450. She preserved Ravenna as functioning capital, adorning the city with new buildings. During her regime, and under its prelate Peter Chrysologus (from 432 to 450), the see of Ravenna replaced that of Milan in jurisdiction over neighboring bishoprics.

Galla Placidia also maintained ties with Rome, where her son held his court; indeed, it was in Rome that she died and was buried. During the tumultuous third quarter of the fifth century, which witnessed the final debasement and destruction of the empire's western court, Rome alternated with Ravenna as the focus of events, but it was in Ravenna that the last western emperor, the boy Romulus Augustulus (r. 475-476), played out his brief reign and was deposed. His nemesis, the barbarian general Odovacar, then ruled as patrician and king of Italy (476-493) with Ravenna as his seat. There he made his stand when he was defeated by the invading Ostrogothic king, Theodoric: Odovacar used the city as his bargaining chip in a negotiated agreement of joint rule, before he was treacherously murdered.

The regime of Theodoric (493-526) opened a new chapter for Ravenna, in which its importance increased. Rome remained the seat of the old senate, with all the trappings of the Roman past that Theodoric so carefully maintained and respected, but Ravenna was his residence. When Ravenna was confirmed as the Ostrogothic capital, its economic life revived, it became a cultural center, and it saw renewed building projects. Several churches and Theodoric's own famous tomb still testify

to his era. However, Theodoric's hope of infusing permanent Germanic leadership into Roman civilization was doomed. Various difficulties, and the murder of his daughter, Amalasuntha, provided an excuse for intervention by the Byzantine empire: its emperor, Justinian (r. 527-565), made the Ostrogothic realm the second target in his ambitious program of reconquest. As imperial commander, the brilliant general Belisarius initiated the era of the Gothic wars, which at first promised a quick victory but turned into a devastating struggle that lasted for two decades. The incompetent Gothic king Theodahad (r. 534-536) was replaced by Witigis (r. 536-540), who fought desperately until he was compelled to surrender Ravenna to Belisarius. The revival of the Goths under Totila (r. 541-553) renewed a conflict that was finally brought to an end by the victories of a new imperial commander, Narses.

Ravenna itself was spared the ruin that most of Italy experienced; largely untouched, it benefited from a campaign of adornment and beautification appropriate to its dignity, and to Justinian's propaganda. Justinian's appointee as prelate of Ravenna, Maximian (r. 546-556), was the first to use the title of archbishop. Narses and his successors maintained the city as the center of restored imperial government and as the bastion of the imperial territories remaining in northern Italy after the Lombards began their own inundation of the peninsula (568). Against their threat, the imperial regime was reorganized, by the later decades of the sixth century, as the exarchate. Ravenna became the capital directly of a province of that name, but its viceregal exarchs also became the governors-general of all of remaining imperial Italy.

Although the Lombards of Spoleto were able to seize Classe in 579 and hold it for ten years, Ravenna itself held firm. Its exarch, Smaragadus, if unable to provide aid to points farther south, at least restored imperial control of the cities along the Via Flaminia. This resecured connection between Ravenna and Rome effectively divided the Lombards' power between the northern kingdom ruled from Pavia and the separate duchies of Benevento and Spoleto. Ravenna seems to have prospered generally through the seventh century, as the economic center of its region. Nevertheless, there were recurrent periods of tumult: to the intermittent Lombard threats were added lurches in Constantinopolitan policies, episodes of local unrest, tension with the papacy in Rome over Ravenna's independence, and the rebelliousness

and ambition of some of the exarchs. In 709, Emperor Justinian II (r. 685-695; 705-711), convinced of Ravenna's hostility and disloyalty, sent a force to punish the city: its leading citizens and its bishop were arrested and carried off to Constantinople (the former to be executed, the latter to be blinded), and the city itself was devastated.

Ravenna recovered but was racked by new disturbances as the Byzantine government attempted to impose its new religious policies of

Iconoclasm over the opposition of the popes in Rome. The sympathies of Ravenna's clergy and population were fully on the side of the popes, and the city only narrowly escaped disaster at the hands of another punitive expedition from Constantinople in 727. But it was the final Lombard threat that signaled Ravenna's fall from greatness. The restless Lombard king Liutprand directed his forces against the city, which received no relief from the Byzantines, and actually seized and held it for a few years (737-740). It was recovered with the help of a fleet from fledgling Venice, but the restored exarchate retained little of its former control over the strained components of Byzantine Italy: the Lombards courted the support of the papacy, against the interests of the Byzantine empire, for control of northern Italy. A new pope, Zacharias (r. 741—752)—the pope who was to initiate a momentous alliance with the Franks—was able in 743 to persuade the aging Liutprand to cease putting pressure on Ravenna. But Liutprand died the following year, and in 751 his successor, Aistulf (r. 744-757), at last achieved the Lombards' aim of seizing Ravenna and ending once and for all its role as a base for Byzantine rule in northern Italy.

Ravenna continued to be the administrative and ecclesiastical center for its region under new overlords, but they were not long to be Lombard. The personal appeals of Pope Stephen III (r. 752–757) to the Franks resulted in the Donation of Pepin (754) and the successive campaigns of Pepin the Short (755, 756). Aistulf was defeated, and the new territorial enclave of the papal states was created as a Frankish protectorate. Ravenna and the immediate lands of the old exarchate now became part of that regime, and in 757 the new pope, Paul I,

visited Ravenna, to achieve territorial control and complete the subjection to Rome of Ravenna's long-independent archbishopric.

The quarrels of the last Lombard king, Desiderius (r. 757–774), with Pepin's son, the great Frankish ruler Charlemagne (r. 768–814), resulted in the final destruction of the Lombard monarchy—or rather the annexation of its crown by the Frankish dynasty—and the renewal (774) of the Donation of Pepin. Though Ravenna and its district remained part of the papal patrimony, it was also under temporal control of its Frankish protectors. Charlemagne himself, visiting the city, marveled at its Byzantine splendors and dreamed of emulating them by copying Ravenna's architecture in his palace chapel at Aix-la-Chapelle and by carrying off some of Ravenna's art. In the aftermath of this tumultuous subjection, Ravenna's past glories and its continuing struggle against the papacy found their strongest literary voice in the work of Agnellus Andreas, a cleric who belonged to a prominent family. His *Liber pontificalis ecclesiae Ravennatis*, written c. 830–845, though spotty and problematic, remains our most important source for the city's history and life.

Conquest by the Franks and control by the papacy reduced Ravenna, meanwhile, from a capital city to a backwater provincial town. Its decline was accelerated by the decay of its old port facilities and the waning of its commercial activity—to be replaced by the restless enterprise of Venice. Nevertheless, as the Franks' power faded and as the northern papal territories were appropriated into the neo-Lombard "kingdom of Italy" (888–962), immediate ecclesiastical control was exercised anew by Ravenna's archbishops, who were given a freer hand as a result of the papacy's period of decadence. With the reestablishment of German dominion over northern Italy by Otto I (r. 936–973) and his dynasty, the prelates of Ravenna became their enthusiastic supporters. These prelates remained agents first of the Saxon emperors and then of the Franconian successors, holding high positions at court and winning for Ravenna intermittent recognition as the administrative seat of German power in Italy, and for themselves confirmation of their own temporal power in the region.

Ravenna flourished sufficiently in this era to contribute at least three distinguished personages to the religious life of the time. Two were of the local Onesti family: Saint Romuald (born c. 956), educated in the

Benedictine house of Classe, became a monastic reformer who founded (1012) the order of the Camaldoli; and Pietro degli Onesti, known as Blessed Peter of Ravenna (II Peccatore, died c. 1119), a local man of great piety, built one of the few important structures in Ravenna of the central Middle Ages, the church of Santa Maria in Porto Fuori. The third was Peter Damian (1007-1072), the great reform thinker and writer in the service of the revitalized papacy.

During the eleventh-century papal reform, Ravenna's archbishops remained staunchly pro-German; and during the investiture controversy, one of them, Archbishop Guibert, was elected as an imperialist antipope, Clement III (1080). Because of this stance, Rome briefly deprived Ravenna of power (1106-1118); and the emergence of communes around the territory permanently deprived its archbishops of temporal authority in most of the towns, though they were able to dominate the aristocratic commune of Ravenna itself and enjoy continuing wealth and prestige. Under these archbishops, Ravenna saw some revival of church building and decoration in the eleventh and twelfth centuries. When Frederick I Barbarossa (r. 1152-1190) attempted to reassert German rule in northern Italy, Ravenna again took the lead in supporting the empire. However, in 1198, with changes in circumstances (including increased regional competition from Venice), Ravenna shifted its loyalty and became a leader of the cities in Romagna and the Marches against Hohenstaufen interests; in the process it became reconciled with the papacy and once again recognized the suzerainty of Rome.

Thereafter, Ravenna's archbishops were pushed into the background as a new circle of powerful aristocratic families emerged, among them the Anastagi, Dusdei, Umbertini, Mainardi, and Traversari. Competing for seigneurial power, and specifically for the new office of *podestà*, they made Ravenna another urban battleground for the pro-imperial and pro-papal factions. At first, the Ghibellines under the Ubertini and Mainardi were able to dominate the city, but in 1218 the Mainardi shifted their alliance to Pietro Traversari. His son, also named Pietro, became *podestà* in 1225, converted to the Guelf cause, and supported Pope Innocent IV against Emperor Frederick II. The emperor managed to seize Ravenna and hold it for eight years (1240-1248), having expelled Pietro. The city was subsequently restored to papal control,

and the Traversari reestablished their power. In 1276, the papacy's title to the city, along with the full regions of Romagna and the Marches, was recognized anew and definitively legalized by a decree extorted from a feeble new German emperor, Rudolf of Hapsburg.

Church of San Vitale, Ravenna. Photograph courtesy of Christopher Kleinhenz.

However, this triumph of Rome was theoretical, and reality stood in contrast to it. In 1275, one of the archetypal *condottieri*, the soldier-adventurer Guido (Minore) da Polenta, achieved sufficient ascendancy to drive out the Traversari and take power as *capitano del popolo*, a position he held until his death in 1310. In the process, he managed to create one of the first examples of a virtually independent territorial *signoria* in medieval Italy. His power was bolstered by a strategic alliance with his previous enemies, the Malatesta family, who controlled Rimini. The seal of this alliance was the marriage of his daughter, Francesca, to Malatesta's elder son. Francesca's tragic love affair with her handsome brother-in-law, Paolo, and their murder at her husband's hands became material for one of the most famous passages in Dante's *Inferno* (Canto 5).

The control of the Polenta family over Ravenna was tightened by Guido Minore's son, Lamberto (r. 1310-1316), who was followed by a nephew, Guido Novello da Polenta. A cultivated man with an appreciation for art and letters, Guido Novello attracted to his court

such notables as the artist Giotto and, above all, the poet Dante Alighieri, together with Dante's daughter and two sons. Dante apparently arrived in Ravenna in 1317; he is said to have given lectures and instruction there, while putting the finishing touches on his *Comedy*. In 1321, Dante went to Venice as ambassador on Guido's behalf; on his way back, he was infected with fever, and he died after reaching Ravenna. The grief-stricken Guido planned a noble tomb for Dante, whose remains (repeatedly solicited by the Florentines, but in vain) rested temporarily at the Franciscan church and were then shifted to a series of sepulchres before being placed in the edifice of 1760 where they still remain.

Guido Novello was soon expelled by a rebellious kinsman and transferred his talents to Bologna, where he was elected *capitano del popolo* (1322); his hope of returning to Ravenna was never realized. His successor, Ostasio da Polenta, was recognized as vicar by both the German emperor and the pope and ruled with great cruelty from 1321 to 1345. The next Polenta lord, Bernardino (r. 1345-1359), was no less brutal and was briefly overthrown by his brothers. Guido Lucio (r. 1359-1389) ruled better, but he too was overthrown by relatives and was succeeded by his son, another Ostasio (r. 1389-1431). The last of the Polentani, yet another Ostasio (r. 1431-1449), had attained his position (barely) through an alliance with Filippo Maria Sforza of Milan. He was then tricked into visiting Venice, where he found himself deprived of his city and sent off to encloisterment and assassination. From 1449 to 1509, Ravenna was held by its old rival, the Serenissima; thereafter, it returned to papal control, under which it remained with only brief interruptions until its incorporation into the emerging Italian state in 1859.

By the late medieval period, Ravenna had lost all its maritime operations and based its prosperity on its operation of the salt flats at Cervia, from which it supplied this valued commodity to the entire Po valley region as its principal export. Not until the creation of the Canale Corsini in 1739 was Ravenna's access to the sea renewed. In modern times, the discovery of natural gas fields revitalized the economy of the city and its region.

Monuments

Only scraps of Ravenna's Roman past can be traced. Much still remains of the basically Roman city walls, however, along with elements of the gates: the walls were maintained over the centuries, and an impressive Venetian *rocca* (fortress) enclave at the northeastern corner represents their continuance in the fifteenth century. A number of Ravenna's earliest churches were totally rebuilt (mainly in the Baroque period): these include, notably, the *duomo*, also known as the Basilica (or Ecclesia) Ursiana; its original foundation is attributed to Bishop Ursus (either 370-386 or 403-429).

Ravenna does, nevertheless, have the finest constellation of monuments and art of the early Christian era in the Byzantine style. Most of these monuments, as we now have them, date from the sixth century, but four important ones survive from the fifth century, and two are associated with one of the great figures in Ravenna's history, Empress Galla Placidia. One of these two, the church of San Giovanni Evangelista, was originally built to fulfill a vow made when the empress and her two children, the emperor Valentinian III and the princess Honoria, were caught in a terrifying storm while sailing from Constantinople to Ravenna for her restoration there. The large basilican church was ruthlessly rebuilt in Baroque style in 1747; still later, after it had been damaged by bombing in World War II, what was left of the original was extensively reconstructed, so that what is seen today preserves little of the empress's actual foundation.

However, the so-called Mausoleum of Galla Placidia is virtually intact and is Ravenna's earliest jewel. It was built originally as a chapel extending the narthex of her church of the Holy Cross: that church has been effectively eliminated by subsequent rebuildings, leaving isolated this small, cruciform chapel, apparently dedicated to Saint Lawrence. It contains three carved sarcophagi, and they have sometimes been identified with the burials of Honorius, Valentinian III, and Galla Placidia. There are stories that Galla Placidia's seated, mummified body survived here until the sixteenth century. In fact, though, it remains debatable whether the building actually functioned for burials, and it is almost certain that the empress herself was interred in Rome, not here. The glory of this little building is not burials but rather the stunning

mosaic decoration (which has received some modern restoration). The central domical vault represents the starry heavens, with zoomorphic symbols of the four evangelists; in the spandrels below are figures of saints. Lunettes in the axial arms show (over the door) Christ (with features of Apollo or Orpheus) as the Good Shepherd tending his flock, and (opposite) Saint Lawrence with the fiery grill of his martyrdom and a display of the four Gospel books (though this representation has also been described as the mature Christ burning books of the heretical Arians). The lunettes of the longitudinal arms have animal scenes (doves at fountains; and souls, represented as stags, thirsting after eternal water). The four arm vaults display stars, and the borders are rich in the vegetational collages so beloved of Roman mosaicists.

Another fifth-century monument is the octagonal baptistery that is part of the latter-day cathedral complex. This baptistery is said to have been originally a chamber of the Roman baths; a few fragments of Roman sculpture are to be found in the exterior walls. It is known as the Orthodox or Neonian baptistery (the latter name from its decorator, Archbishop Neon, who served c. 449-459). Its walls are encrusted with arcading and rich marble and stucco revetments, above which are two circles of mosaics: the first showing eight shrines in separate panels, containing either enthroned crosses or altars with open Gospel books; the second showing the twelve apostles carrying their crowns. In the center is one of the earliest representations (much restored) of Christ's baptism, attended by the river-god Jordan.

The last of the monuments of this period is of uncertain date. This is a small chapel dedicated to Saint Andrew, part of the fragments of the medieval archbishops' palace incorporated within later rebuildings (and now part of the Archiepiscopal Museum). Some traditions trace its building back to the bishop and saint Peter Chrysologus (c. 432-450); others date it to Bishop Peter II at the end of the fifth century; and the mosaics are sometimes dated to the time of Archbishop Maximianus (546-556). These mosaics, much reworked, include handsome figural and symbolic elements in the vaulting over an elegant pavement. Even more impressive is the antechamber, which has vaulting with rich naturalistic decoration, framing a panel over the door showing a beardless Christ in full armor (symbolizing the church militant), treading down the lion and the adder and holding an open book

revealing the motto *Ego sum via Veritas et vita* ("I am the way of truth and life").

Several structures survive from Theodoric's ambitious building program; most of these were recast under the imperial restoration, though at least two have come down to us with something of their original character. The great church of Santo Spirito, built for the Arian Christian rites of the Ostrogoths, has been totally lost in rebuildings of later centuries. But near it is the so-called Arian baptistery, which may have functioned earlier as a bath chamber. This small brick octagon is devoid of interior decoration—except at the crown, where there is another mosaic of the baptism of Christ (here too with the river-god Jordan), surrounded by a circle of apostles: Peter holds his keys, Paul holds a book, and the rest hold crowns.

The other original Ostrogothic building is the extraordinary Mausoleum of Theodoric, just outside the northeast corner of the city walls. It is built of finely dressed and squared stone and has two stories: the lower decagonal, the upper circular, surmounted by an enormous monolithic capstone said to weigh some 300 tons. It was presumably originally surrounded by a colonnade of some sort, now lost, which would have included stairs to the otherwise inaccessible upper chamber. Its curious design has given rise to much debate and dispute regarding derivation (Roman or Germanic?) and symbolism (a tent? a helmet? a crown?). The upper chamber still contains a porphyry receptacle, presumably the king's sarcophagus; however, Theodoric's body was desecrated and removed at some point well before the ninth century, when the building was used as a church (Santa Maria della Rotunda) by an adjacent Benedictine monastery.

A principal monument begun by Theodoric but transformed under the imperial restoration is one of Ravenna's greatest churches, known now as Sant'Apollinare Nuovo. Its Arian builder originally dedicated it to Christ; when it was converted officially to the Catholic rite by the archbishop and saint Agnellus in 560, it was rededicated to Saint Martin (though it was also known as the *Caelum Aureum* from its onetime golden roofing); it received its final consecration—to Ravenna's traditional first bishop, Apollinaris—in the ninth century; the word *Nuovo* distinguishes it from the great church of Apollinaris in Classe. The cylindrical campanile also dates from the ninth century. The

present portico and facade date from the sixteenth century, when the decaying church was overhauled.

The interior of Sant'Apollinare Nuovo is in basilican form, with a wide central nave and two side aisles. Whatever decoration was made around the apse has been lost, first in an earthquake of the sixth century and then during further replacements in the eighteenth, (The interior west wall is likewise bare, though now affixed to it is a mosaic fragment showing a crowned royal portrait decorated and labeled as Justinian, but perhaps originally Theodoric.) However, what does remain—the mosaic decoration of the nave—is spectacular in size and quality. In the lowest mosaic register on either side, directly above the (rebuilt) arches of the colonnade, are processions of saints. The procession on the southern side emerges from a representation (at the west end) of Ravenna, dominated by the portico and ceremonial portal of Theodoric's palace, but with some of the city's churches visible in the background. The twenty-five saints are all male—each identified in lettering—holding palms and martyrs' crowns. The procession concludes (at the east or altar end) at a great throne, where Christ sits in majesty, surrounded by four angelic sentinels. On the northern side is a procession of female saints— twenty-one virgin martyrs; these too are identified by name labels and are holding palms and crowns. They emerge from a representation at the west end showing Classis, through the gate of its walls, behind which are ships in the harbor. At the head of this female procession we find the three Magi (with name labels), carrying their gifts before the star of Bethlehem, as they reach the common destination at the east end, showing another throne on which sits a majestic Madonna holding the baby Jesus, while another four angels stand guard. In the register above on both sides, alternating with windows, are figures of prophets and church fathers, sixteen on each side. Above them, in bands that run the full length of each side, are mosaic compartments. Those over the heads of the figures show ceremonial throne-shrines. Alternating with them, and over the windows, are scenes, thirteen on each side, showing episodes from the life of Christ. Those on the north side, over the female saints, show miracles performed by Christ; those on the south side, over the male saints, show episodes from Christ's passion and resurrection. These magnificent mosaics were begun under the Ostro gothic regime but

were modified in mid-century after the Byzantine conquest. Revisions are particularly evident in the scene of Theodoric's palace, where certain figures were eliminated from the king's retinue.

Three important churches, of which two survive, were built directly by the Justinianic regime, with considerable financial contributions from a local official, Julianus Argentarius. The church that was lost was San Michele in Africisco (whose apse, greatly restored, was transferred to Berlin for display during the nineteenth century). One of the surviving churches is the remarkable San Vitale, begun under Bishop Ecclesius (522-532) and dedicated in 547 by Archbishop Maximian. It is octagonal in shape, and its dome is supported by eight piers in two stories linked by columned galleries. San Vitale has been linked to architectural experiments in Constantinople during Justinian's time, and its pattern was the model for Charlemagne's palace chapel (to which were transferred some decorations stripped from San Vitale). The original mosaic decoration survives only in the spectacular chancel. Under a richly decorated arch—focused on a medallion of the Lamb, arch medallions of Christ and the apostles, and scenes of Jerusalem and Bethlehem—the apse conch shows Christ triumphantly enthroned, with Saint Vitalis (to whom Christ offers a crown) and Bishop Ecclesius (holding a model of the church, as its donor) presented to him by attending archangels. On either side above the altar, symbols and figures of the evangelists frame Old Testament scenes prefiguring the eucharist: the sacrifices of Abel and Melchisidech, and Abraham's serving of the three angels and his sacrifice of Isaac. The most famous works are two panels on either side of the apse wall, showing Justinian and Theodora as contributors to the church. Backed by guards and retinue, Justinian appears in court regalia, as if in a procession, carrying a gold basin, to be received by Archbishop Maximian (whose name is explicitly given) and others (whom some scholars have tried to identify with Belisarius and Julianus). Theodora is shown in a side chamber with eunuchs and handmaids, near a fountain, carrying her gift, a chalice; her rich garb includes a representation of the three Magi.

The second of the surviving Justinian churches is Sant'Apollinare in Classe. This massive basilican structure—built, it is said, at the site of Saint Apollinaris's grave—was begun by Bishop Ursicinus (532-536) and consecrated by Archbishop Maximian (549). The marble decorations of

the nave and aisles were removed as plunder by Sigismondo Malatesta in 1449. The surviving, glorious mosaic decorations are all in the apse. Below a medallion of Christ and the symbols of the evangelists and portrayals of the Christian flocks coming forth from Jerusalem and Bethlehem, the apse conch evokes the Transfiguration, symbolized as an enormous cross mounted within a star-studded circle; it is attended on the sides by Moses and Elijah, and it dominates a paradisiacal landscape full of vegetation and populated by a flock of twelve sheep (representing the apostles). Above, the hand of God gives a blessing; below, centrally placed, is Saint Apollinaris in prayer. Between the windows are portraits of prelates of Ravenna. On the right side wall, clearly in imitation of the Justinian panel in San Vitale, the emperor Constantine IV (r. 668-685) is shown with two of his sons and attendants awarding *privilegia* (a large rolled document, so labeled, authorizing the see's autocephalous or independent status) to Archbishop Reparatus. This mosaic, though in a debased and cruder style, is the latest of the great Byzantine masterpieces in this medium in Ravenna.

A superlative work from the Justinianic era is displayed in the Archiepiscopal Museum: this is the throne of Maximianus, made in Constantinople as a gift from Justinian to Archbishop Maximianus. Over a wooden frame are mounted a network of ivory panels, showing Christian saints, the Old Testament story of Joseph, and miracles of Christ.

The latest monument of Ravenna's early medieval era is a facade wall to be seen not far from the church of Sant'Apollinare Nuovo. It was traditionally misidentified with the palace of Theodoric, but it is apparently the front portion (later used as a church) of the palace of the Byzantine exarchs. Excavations behind it have revealed portions of the foundations.

Rayniero Arsendi Da Forli

Rayniero (d. 1358) belonged to a prominent pro-imperial family in Forli and spent much of his youth in exile. He then lived in Ravenna but studied in Bologna with Bertoluccio Preti. Rayniero taught in Bologna from 1319 until 1324; he taught the *Infortiatum* and *Digestum vetus*, leaving the *Digestion novum* and the *Code* to his colleague Giacomo Bottrigari. Ricciardo Malombra was another colleague. During an interdict imposed on the city in 1338, Rayniero left for Pisa. Then he moved to Padua, where he lectured until his death. Rayniero left annotations to various passages in the *Digest* and the *Code*, plus a few brief works and legal opinions. The great Bartolo da Sassoferrato studied with Rayniero and Bottrigari.

Re Giovanni

Re Giovanni (Jean de Brienne, c. 1180-1237) was born in France and spent several years in Italy. From the end of the First Crusade until his death, he participated in numerous military ventures; the chronicler Salimbene praises him for his physical attributes and his military prowess. Re Giovanni acquired the title of king of Jerusalem through his marriage to the daughter of Corrado di Monferrato. His own daughter Isabella married Frederick II in 1225, and Re Giovanni probably spent some time at the *magna curia*, where he familiarized himself with the Sicilian poetic language. The Vatican Codex (Lat. 3793) attributes one poem to him, but his authorship has been called into

question by some scholars. Lazzeri (1942) assumes that this poem, a rare example of the *discordo* genre, may have originally been written in French and then translated by Re Giovanni. Three French poems attributed to Re Giovanni were actually written by Jehan de Braine, count of Macon and Vienne, who died in the Holy Land in 1239.

Reliquaries

Reliquaries serve as containers of sacred Christian relics dating from the earliest cult of the martyrs. Relics are objects identified with the life of Christ or with parts of the bodies of martyrs— people who died for their religious beliefs. Reliquaries fall under a variety of types: shrines, caskets, coffers, reliquaries, tabernacles, or diptychs and triptychs.

Among the earliest containers of saints' relics, small openings were

cut into the receptacle, usually a small box, for oils to be extracted for distribution among the faithful. The earliest reliquaries date from the fifth century and have decorated covers of precious metals. They include early Christian caskets (coffers), such as the ivory *Lipsanoteca* of Brescia; a fifth-century gold cylinder from beneath the altar of the cathedral of Puli; and another gold cylinder from the cathedral of Grado. Similar small boxes, called *staurotheques*, are found in the Byzantine empire and subsequently in the west and usually contain a small cross inside of which was a relic believed to come from the actual cross of the crucifixion. The cross of Urban II (1092), preserved in the reliquary chapel of Badia della Trinità della Cava (monastery of Cava dei Tirreni, Salerno), contains such a relic.

During the Romanesque period, and corresponding to the crusades to Jerusalem, there was another surge of activity, during which relics of the saints and holy sites were brought back. Reliquaries in the form of body parts of saints—such as the arm reliquary (*brachium*) of Saint Magnus or the leg reliquary of Saint Theodore (Venice, Treasury of San Marco)—are similar to those found throughout the rest of the European continent. During the age of pilgrimage (c. 1100-1300) pilgrims traveled long distances to visit shrines where sacred relics were preserved. Often these pilgrims were suffering from incurable illnesses, or they were criminals sentenced by episcopal courts to make penitential pilgrimages. Their travel to distant lands thus became a Journey for spiritual, if not physical, healing, or a way of repenting for their sins and crimes. There was a strong traditional inclination toward sympathetic magic; thus proximity to sacred relics was believed to increase the likelihood of a cure or spiritual cleansing. Some reliquaries were placed where they could be touched or kissed by the devout. Whereas monumental settings are found at major sites in France (e.g., Saint Foi at Conques, Saint Sernin at Toulouse) and in Spain (e.g., Santiago de Compostela), reliquaries in Italy did not take on monumental form until the Gothic era, when they followed models in France, Spain, and Germany. One example is a casket reliquary of unknown origin in the treasury of Pope Boniface VIII (c. 1305) in the cathedral of Anagni.

Relics represent a wide range of objects: clothing, ornaments, bodily remains of saints, images, oil from the lamps at holy sites, and soil from

sacred places. Other relics are identified with events in the life of Christ or of a saint. Relics include the wood believed to be from the True Cross, thorns believed to be from Christ's crown of thorns, the arms of Saint Blaise and Saint Magnus (in Venice), a finger of Saint Louis (in Bologna), and the foot of the tenth-century Saint Egbert (in Cologne). A monstrance or *ostensorium* held relics; monstrances, unlike other reliquaries, were sometimes carried in processions. Head reliquaries, usually in the round, were made of gold or silver, or a combination of metals; although most date from the Romanesque era, they continue to be found in the late fourteenth century. Among the reliquaries of medieval saints are those of Praxede (inscribed Pope Honorius III, 1216-1227) and Agnes (Nicholas III, 1277-1280), both in the Vatican Museum; and a late thirteenth-century head reliquary of Saint Galganus in Siena (in the cathedral museum), made for the abbey of San Galgano (near Siena). The reliquary of Saint Juliana (1376) is Umbrian in origin, and the finger reliquary of Saint Louis of Toulouse in the church of San Domenico (Bologna) was made in Italy by French artists for Charles II of Anjou. A whole bust reliquary of French origin of Saint Januarius (c. 1304-1306) is preserved in the treasury of the cathedral in Naples. A reliquary bust of Saint Agata was made for the cathedral of Catania (1376) by Giovanni di Bartolo; a silver reliquary for Saint Zenobius by Andrea Arditì survives in the cathedral in Florence (it is dated 1331). A Tuscan reliquary bust of Saint Donatus (dated 1346, by "Pietro and Paolo"):an be found in the Pieve di Santa Maria (Arezzo); another bust af this saint is found in the northern Italian town of Cividale [it is in the cathedral treasury and is signed by Donandino). Reliquary busts (now lost) of saints Peter and Paul, made for [he cathedral of Catania (1376) by Giovanni di Bartolo, were donated by Pope Urban V to Saint John Lateran. These examples attest to the proliferation of both the images and the religious practices surrounding them.

Celebration of relics of saints became widespread by the mid-thirteenth century. This is indicated by the large number of altars dedicated to a large number of saints, and by the emergence of pilgrimages to these locations. At this time, the containers for the relics began to assume monumental form. By the tenth century, portable altars usually contained relics, as did later small portable altarpieces,

both of which were commonplace in the late Middle Ages. The container holding the remains of a saint is, significantly, called a casket. Caskets had the form of a rectangular box with a base and a pedimented lid; and by the late eleventh century they were often covered with fine metalwork and enamel. The casket, or *châsse*, with a gabled roof and finials became a common form at the beginning of the Gothic period, but it was not limited to the shape of a casket. After Saint Louis purchased the "crown of thorns" from Baldwin II, the Latin emperor of Constantinople (1239), it was made into a reliquary crown (c. 1264). Saint Louis was himself canonized in 1297, after establishing the feast of Corpus Christi. His own body was then put into reliquaries, some as small as liturgical crosses and glass monstrances. As macabre as these practices may seem today, such relics were required to establish the validity and efficacy of any Christian altar. In each church, the main altar and all subaltars were required to hold the relics of a sacred event, site, or saint.

Reliquary with a splinter of the Holy Cross. Anonymous, fourteenth century. Santa Croce, Florence. Photo: © Scala/Art Resource, N.Y.

Relics were sometimes incorporated into diptychs and triptychs, because this made them more portable from altar to altar—unlike the large shrines established during the Romanesque period. Diptychs and triptychs do not appear in Italy until the fourteenth century, when smaller devotional images were more commonplace than they had been in earlier times. A notable example of this kind of monument is the beautiful enamel reliquary of the *Holy Corporal* by Ugolino di Vieri (1337-1338) in the cathedral of Orvieto. This tabernacle reliquary was a collaborative effort of three artists in Orvieto— Ugolino (a Sienese), Viva di Lando, and Bartolommeo di Tommè(also known as Pizzino)—to commemorate the "miracle of Bolsena." It is designed in the form of a

triptych in three registers; both sides of the panels present historiated scenes (from the life of Christ), terminating with gables at the top. This design creates an image similar to that of the cathedral facade, and to the *Maestà* by Duccio di Buoninsegna that once graced the high altar of the cathedral in Siena.

Other reliquary monuments also celebrate sacred objects: e.g., the reliquary of the *Tree of the Cross*, dating from c. 1360, in Lucignano (Museo Civico) in the Val di Chiana in Tuscany; the crozier in the cathedral treasury at Citta di Castello (Umbria); the reliquary of the *Holy Thorn* in San Lorenzo (Florence); and the reliquary of the *Precious Blood* (now at Montreuil-surMer, France, but Italian in origin).

Other Gothic shrines include the reliquary of Saint Chrysogonus (1326, in the treasury of the cathedral of Zara); the reliquary bust of Saint Ermagora (in the cathedral of Gori-zia); the reliquary of San Giovanni Gualberto, at the Vallombro-san monastery of Passignano; the shrine of Saint Simeon by Francesco da Sesto of Milan (1377–1380); and a shrine at Zara in the church of Saint Simeon.

Throughout the Middle Ages, the worship of reliquary objects was widespread and was often associated with miracles and miraculous cures. The fashioning of reliquaries and their placement on altars in medieval chapels and churches responded to an ancient human quest for healing and spiritual peace.

Remigio Dei Girolami

The Dominican Remigio dei Girolami (d. 1319) was a well-known teacher and preacher in Florence. He was a member of a family prominent in the wool guild and in municipal civic life. For many years, he was lector of theology in the great Dominican convent of Santa Maria Novella. In addition to his fame as a preacher, he also gained renown as a welcomer of visiting kings, cardinals, and other dignitaries; as an exhorter of civic officials to promote the common good; and as an orator at funerals and commemorative occasions for local and foreign notables. There were few types of public ceremony in Florence or in his order in which he was not at least occasionally a conspicuous participant. Although some of his closest relatives were exiled after the triumph of the Black Guelf faction in 1302, Remigio's own popularity with those in power seems to have continued. In 1313, answering a query from Sienese officials about his political soundness, the Florentine government called him "a leading father to our corporation (*universitati*)."

Remigio also wrote treatises on a rich variety of theological,

philosophical, and political subjects, but these seem to have aroused little interest until the second half of the twentieth century, when a number of them were edited. Early in the century, G. Salvadori published some extracts from Remigio's public sermons and advanced the thesis that he must have been Dante's teacher at the time when Dante tells us he was frequenting the "schools of the religious." The theory remains unproved, but it has been widely accepted and is not improbable, for during this period Remigio was the principal lector of one of the two leading schools of the religious in Florence.

Whether he taught Dante or not, Remigio's teaching was important in the Florence of his own day, and it was most emphasized by the chronicle or necrology of his own convent. The entry about Remigio says that at the time of his death he had been a Dominican for fifty-one years and ten months, of which more than forty years had been spent as lector of Santa Maria Novella. Remigio was licensed in arts in Paris, entered the Dominican Order in the "first flower of his youth," and made such rapid progress, according to the necrology, that he became lector at Florence while still a deacon and before being ordained as a priest. He must have become a Dominican in Paris c. 1267-1268, since, as Panella (1982) has shown, he heard Saint Thomas Aquinas during Aquinas's last period of teaching there, from 1269 to 1272. Remigio served in many important positions in his order, and he was already preacher-general by 1281. He returned to Paris c. 1298 at the express wish of his convent to continue his theological studies and qualify for the *magisterium*. He had returned to Florence in August 1301 but soon went to Rome in the hope of receiving the *magisterium* from Pope Boniface VIII, but this ambition was frustrated by Boniface's sudden death. Remigio finally received the *magisterium* from a fellow Dominican, Pope Benedict XI, probably in 1304 at Perugia; we know that he preached and disputed there, and apparently he did not return to Florence again until 1306 or 1307. This seems to have been his last long absence from the city and the lectorate of Santa Maria Novella, though the necrology says that he gave up teaching and preaching a few years before his death (probably by 1316, when there was a new lector of theology at the convent) and devoted himself to composing and compiling religious books. This activity seems to have consisted in large part in the collecting and editing of his own works.

Remigio's works are contained in four early fourteenth-century double-columned folio volumes and a later collection of Lenten sermons in the *Conventi soppressi* manuscript collection of the National Library of Florence, plus two copies of a commentary on the Song of Songs in the Laurentian Library, also in Florence. The four *Conventi soppressi* volumes are C.4.940, Remigio's treatises; D.1.937, sermons *desanctis et festis*; G.3.465, questions; and G.4.936, sermons *de tempore*, and those for special occasions. The last includes a section of prologues that Remigio preached at the beginning of his courses. Most are on books of Peter Lombard's *Sentences* or the Bible; but two deal with Aristotle, and one of these is devoted specifically to Aristotle's *Ethics*. Together they comprise some 2,700 folio sides. The four folio volumes, except for the first seventy-four leaves of C.4.940, are all written in the same highly abbreviated hand, with additions, annotations, and corrections by a second hand, evidently that of Remigio himself. Although a few copies of particular sermons have been found in manuscripts of non-Florentine provenance, Remigio's fame was mainly local, and knowledge of his writings was confined almost entirely to his own convent. But his writings must have been important there, for they furnished a rich repository of materials for preaching and for instruction in an important, if somewhat provincial, Dominican school. The purpose of the compilation of these volumes is confirmed by an elaborate web of cross-references, both in the text and in the margins, that connect works in the same volume and in different volumes. Many of the sermons, for example, are merely outlines but often contain references to allegorical and anecdotal material in other sermons and in treatises. As for the treatises (contained in Biblioteca Nazionale, Florence, MS Conventi Soppressi C.4.940), they do not cite the sermons, but they often cite and thereby reinforce each other.

Originality is not the most striking characteristic of Remigio's works. On the other hand, his concern with contemporary events and problems and his intense Florentine patriotism are often apparent. Although Remigio copied quantities of material from Aquinas in his treatise *De peccato usure*, its editor describes Remigio's analysis of the sin of usury as somewhat more flexible than Aquinas's. In a long digression in another treatise, *Contra falsos ecclesie professores*, Remigio tried valiantly, if with only partial success, to find a middle

ground between those who exalted and those who decried the claim of the papacy to universal temporal authority. Perhaps the most interesting aspect of Remigio's thought was his effort to fuse the Augustinian concept of peace with the Aristotelian concept of the common good and apply them to the problem of faction in his own city, identifying them with the good of the commune. Several of his treatises and a number of his sermons are devoted to this theme. He also—like his fellow Dominican Ptolemy of Lucca—tried to inspire his fellow citizens through examples of civic virtue furnished by the heroes of the Roman republic, whose willingness to sacrifice themselves for their *patria* he (again like Ptolemy) did not hesitate to identify with the Christian virtue of *caritas*. Not to be a citizen, he affirmed with Aristotle, was not to be a man; and for Remigio, citizenship required the realization that the good of the part was subordinated to and included in the good of the whole. Of course, the common good of Christendom took precedence over the common good of Florence, and its head should be obeyed whenever possible; but if a command of the pope contravened the peace and well-being of the commune, even that command should be disregarded.

Revenues

This article outlines the revenues garnered by the secular church and by imperial, royal, and civic governments from the late classical period to the early fifteenth century. Regardless of the entity collecting the revenues, several factors affected the nature, imposition, and collection of revenues: the specific and general needs of the authority, the power and stability of the authority, the mechanisms for collection and the means of coercion involved, the effectiveness and efficiency of record keeping and management of funds, the availability of coins in relation to the demand for monetary payments, the "incidence" of the imposition (i.e., on whom it ultimately fell), the general economic conditions (often dependent on annual crop yields) of the people on whom the demands fell, and attitudes (often traditional) toward the authority and the imposition. Revenues could be in kind or in cash, could be collected regularly or sporadically, and could be dedicated to specific or general uses.

Local parishes in Italy relied on support from patrons (including produce of dedicated land); faithful commoners' pious bequests and donations of goods, land, and money; and a share (generally one-fourth in the north and one-third in the south) of mandatory tithes. The

Lombards practiced voluntary tithing for pious foundations, but the Franks made the tithe a virtual tax for the support of parochial and episcopal needs, including almsgiving. Though a tithe might not always have meant ten percent, nor was it always monetary, it was levied on just about everything medieval society produced, including grain, wine, oil, most farm animals, anything traded or sold, fishermen's catches, wool, wax, honey, and dairy products. Over time the portion set aside for episcopal use often fell into the hands of lay holders of church benefices or those holding mortgages of church properties, and it became a secular income flow that was soon being bequeathed, infeudated, and divided among lay and church authorities, all the while losing its sacramental purpose and nature. From early on, bishops and their cathedral chapters also enjoyed proprietary income from their estates, including rents and profits in kind and cash, gifts, and bequests. During the High Middle Ages they gained the right to a share of the property of those who died intestate, fees for certain ecclesiastical services, fines and penitential restitutions from the guilty, and customary "gifts" presented by civic authorities.

Papal revenues depended on three sources during the late classical period: subventions from the state, which dried up as Rome declined; voluntary gifts from the faithful, which included testamentary bequests and donations left on papal altars; and dues and rents from estates that had devolved to the bishops of Rome. With the creation of the papal state in the eighth century, popes adopted the Byzantine model of regalian rights (i.e., rights reserved to the sovereign) and imposed taxes, fines, tolls, and fees, especially related to judicial matters, throughout the territory they controlled. Also beginning in the eighth century, a number of monasteries gave "census" payments to the papacy, which guaranteed their freedom from lay interference or encroachment. Feudalism, developing from the ninth century on, brought with it service and in-kind dues from vassals of the papacy who held papal land as benefices. Regalian claims also expanded in the eleventh and twelfth centuries to "procurations," sums that were paid when new rectors arrived in a city or province; monetary payments in lieu of military service; and the *focaticum*, or hearth tax on households. Beginning in the tenth century, payments of cash tribute also resulted from papal claims to lordship over islands such as Sicily and England;

the emerging kingdoms of Poland, Portugal, Aragon and Castile; and other regions and cities. At about the same time, England, Poland, and the Scandinavian kingdoms began paying "Peter's pence"—small sums that were collected by local priests and often skimmed from as they made their way to Rome. By the thirteenth century, Italian bankers came to be very important in facilitating these international transactions. Popes also came to rely on loans from these bankers.

Clerics also made payments that supported the papacy. Gracious gifts and voluntary subsidies for specific purposes, however, evolved into taxes and compulsory fees. A 2.5 percent tax on clerical incomes was established in 1199, initially to support a crusade. Prelates who assumed certain offices traditionally made a voluntary gift to the pope; this turned into a rigid custom that developed into a mandated "service" set at one-third of the income from the position for the first year. Later, those from whom a "service" was not required paid a similar "annate" instead; together, these sums constituted an important percentage of papal revenue. Popes also derived income from dioceses that were left without a bishop for a time ("first fruits from a vacancy"), from clergy who assumed a position for which they were not canonically qualified ("fruits wrongfully received"), and from the goods left by clerics who died intestate ("spoils"). Most of these developed during the thirteenth century as the popes' demand for revenue increased dramatically.

Both clerics and laypeople doing business with the papacy incurred chancery fees for the production of documents: a schedule from the 1250s lists eight set charges, and less than a century later 415 such fees were listed. Charges for "indulgences" began with a fee for drawing up the penitential document and were not truly abused until the Renaissance. Those seeking special favors from the head of the church—including indulgences, dispensation from certain requirements (e.g., marriage annulments), and absolution from egregious sins—paid "compositions" as a kind of pecuniary penance in addition to charges for the paperwork. Pilgrims to Rome, especially during jubilee years (beginning in 1300), contributed a good deal of cash, much of which found its way to the papal treasury. Fines and fees for judicial services, income from the seizure of heretics' property, and finally—at the end of the fourteenth century—the sale of church offices rounded out the sources of papal revenue during the medieval period. A growing

demand for funds during the thirteenth and fourteenth centuries vastly expanded the revenue base of the Roman and Avignonese papacy.

In the late Roman period, taxation was plagued by high rates, inefficient collection, and uneven incidence. The Ostrogothic king Totila insisted that all payments due be made directly to him, bypassing the landlords and imperial administrators. In areas controlled by the Byzantine empire, the basic Roman pattern continued until the end of the sixth century. High taxes on land, which supported the imperial military and administration, hurt both peasants and landlords; often, the landlords forfeited their holdings to the administrators. Other imperial imposts included poll taxes, capitation taxes, various tolls and user fees, judicial fees and fines, and rents on imperial property. In Sicily, heavy agricultural dues oppressed the peasantry, though the burden was alleviated, at least in part, by the lower rates and more efficient administration of land taxes after the Muslim conquest.

Lombard rulers drew income in cash and kind from their own properties and from landlords during visitations. The effective tax on land dropped, but Roman-style exactions in the form of commercial taxes continued, as did market, port, and import duties. Churches made loans and payments of tribute, and the Byzantine state paid tribute to the Lombard king as well. In general, the incidence of payments shifted away from the landowners and peasants.

The Carolingian kings followed Frankish custom in demanding regular provision of service and in-kind payments from the conquered Lombards, as well as tribute from the south. After 990, these payments dried up as imperial assets and fiscal rights were sold, given away, or usurped. The Salian emperors received irregular payments of a hearth tax, and later emperors benefited by selling regalian rights—such as appointing notaries, granting patents of nobility, and minting coins—to the emerging communal governments in northern Italy.

Norman kings in Sicily and southern Italy received revenues from both regalian and feudal sources. They relied on produce from their demesne and personal service and in-kind payments from vassals (when the vassals were not rebelling), as well as regalian rights to taxes on non-Christians; grain exports; and the use of ports, bridges, and bathhouses. To the kings—if they could collect it—also went treasure troves, remains from shipwrecks, and the property of those who had

died intestate. The crown taxed markets and cattle, and heavily fined towns that rebelled. Under Emperor Frederick II, the state expanded monopolies to include mines and minerals, iron and steel, hemp and silk, salt, and dyes. Land, including church patrimony, was also heavily taxed at times, often as partial punishment for unrest on the part of nobles.

Urban northern Italy after 1000 gained in power and wealth as a result of a number of factors, including an impetus toward communes; a revival of Roman law, which helped expand and rationalize secular organization and administration; the weakness of imperial claims over the cities; and improvements in general demographic and economic conditions, which included a greater circulation of coins. Fiscal rights that cities either bought or usurped from the emperor or local nobility included tolls, customs duties, taxes on commerce, the salt monopoly, and guild dues. Governments of seaport cities like Genoa, Venice, and Pisa benefited first and most from expanding maritime trade. In Genoa between 1200 and 1275 the value of taxable maritime commerce doubled, and then it doubled again by 1293 to 5.5 million, about twice the revenue of the French crown. As early as the tenth century, Venice charged merchants a licence fee of 50 pounds for the right to purchase food from the Italian kingdom for sale in Venice, and payments in spices went to the doge for the privilege of operating commercially in Venice itself.

The right to levy the imperial hearth tax had been purchased or usurped by most cities by the twelfth century, but by 1250 most cities had replaced it with a tax on estimated wealth, variously known as the *estimo*, *dazio*, or *lira*. This was the main source of revenue for northern Italian cities until the early 1300s. It shifted the incidence of increasing taxation for war and administration to the wealthy, but the estimations, valuations (original cost, rental value, selling price), and collections were subject to corruption and error. By 1315, Florence had dropped this tax for citizens (though retaining it for subject communities) in favor of indirect imposts known as *gabelle*. By the later 1330s, these imposts accounted for 75 percent of state revenues, according to the chronicler Giovanni Villani. Florence had thirty *gabelle*, including four "major" ones on imports (the *porte*, or gate *gabelle*), salt, contracts, and retail wine sales. Between c. 1330 and 1380, revenue from the duties on

pigs increased by 700 percent, and revenue from those on wine, eggs, and olive oil increased by 500 percent, despite a drop in population. This general picture holds true for many Tuscan and Lombard cities. These indirect charges hurt the poor and smaller merchants most, so governments tapped the resources of the rich through loans, both voluntary and forced.

Loans to civil governments began at least by the 1160s in Genoa and Venice. Urban Jewish communities and emerging banking houses were usually approached first. The earliest known "forced loan" was in Venice in 1207, although the practice was not regularized until 1362. Florence began using these *prestanze* in 1345. The public debt fund, or *monte*, grew rapidly, and soon shares or credits became negotiable financial resources that were bought and sold, usually at high discounts. Public debt rose from a debt-to-annual-income ratio of 1:2.5 in 1315 to 5:1 in 1370. Initial annual interest rates ranged well above ten percent, but in 1380 Florence capped its rate at five percent, well below the return on most commercial investments.

Each city government composed the package of imposts that seemingly best met its needs and resources at any one time, and these varied over time. San Gimignano used a general *gabella*, a judicial tithe on civil cases, fines, forced and voluntary loans, and, after 1276, consumption taxes that came to include wills, dowries, and official salaries. Lucca set three *gabelle*: one for expensive imports, one for cheaper imports, and one on wine. The Lucchese state held monopolies on salt and gaming tables and levied taxes on grinding flour, retail sales of bread and wine, prostitutes, contracts, rents, leases, moneylenders, and innkeepers. The authority to collect the taxes on many lesser sources of income was literally auctioned off to individual entrepreneurs who might be described as "tax farmers." These individuals bought one-year contracts under which they paid monthly installments to the state. This system generally worked well.

Rhymed Offices

In the fourteenth century, Ralph of Tongres said that all nations conformed to the Roman antiphonal with respect to the offices of the *temporale*, but that Italian churches conformed to the *tanctorale* to a greater extent because they allowed very few proper offices for saints. In making this statement, Ralph was surely referring not to the proper offices for saints that were common to all uses, early and late, but to newly composed proper offices for saints and feasts, mostly of the later Middle Ages, that characterized the Proper of Saints in most of Europe. In the majority of those offices were in poetry, giving rise to the term "rhymed office" or "versified office."

A casual perusal and even a more systematic search of Italian sources for versified offices would seem to confirm Ralph's observation. The thirteenth-century reforms of the Roman liturgy in association with the newly founded Franciscan order had brought about a briefer, concise liturgy suitable for busy Roman administrators as well as for itinerant friars. Quite quickly books within Rome, and by the fourteenth century books in other parts of Italy, were made to conform with the Roman-Franciscan use. Indeed, non-conforming manuscripts were often

destroyed. Thus the liturgical books that surface most readily in Italy are those of the Roman Curia, virtually synonymous with Franciscan use. These contain very few rhymed offices other than those of the Franciscan order itself.

Here, a misapprehension must be corrected. A relatively recent survey of rhymed offices in general stated that some 700 rhymed offices are to be associated with the Franciscans. Detailed cataloging and identification have yet to be carried out, but the most recent general work (as of this writing) on the topic—the present author's catalog of some 1,500 late medieval offices— suggests that this number is exaggerated some tenfold. But even the seventy rhymed offices probably associated with the Franciscans are hard to find. Most of course have no Italian connections and would not appear in Italian books of any kind.

Thus Ralph's statement seems to be correct. But the tools for accurate investigation have until very recently not been available. The new catalog of late offices just mentioned (although still presenting a European overview rather than local detail) allows a more accurate picture to be presented. A full accounting and inventory of liturgical manuscripts in Italy would make the task easier: some of the sources, especially the large *chorali*, are (or were) accessible only to art historians, for example.

A rhymed office consists of thirty to forty items: these are the items of the services—principally vespers, matins, and lauds—that are sung to plainsong (loosely known as Gregorian chant), namely, antiphons, invitatories, responsories, and their verses. From the twelfth century, using regularly rhymed and accentual poetry, these were widespread across the whole of Europe until the Council of Trent removed them. Before the twelfth century, new offices were usually written in prose, rhymed prose, or prose structured by rhyme, meter, and other rhetorical devices in various irregular schemes.

Deciding what is an Italian rhymed office is no easy task. The office for Francis of Assisi, for example, was written (possibly in Paris) by an official attached to the chapel of Louis IX; Anthony of Padua (whose office is modeled on that for Francis) was Portuguese by birth; the office for Catherine of Siena is modeled on that for Saint Dominic, which was probably written by a Spaniard. Yet all three are obviously saints

important for Italy and Italian liturgy. Nicholas, a universally venerated saint, was bishop of Bari. Do all offices for him qualify? Briefly, the criteria for "nationality" of an office are allusions to specific places and events in the texts; place of use of the manuscripts; and place of the cult, relics, and veneration.

On the basis of these criteria, rhymed offices, in fact, seem no less common—numerically—in Italy than elsewhere in Europe. A simple count of offices associated with Italy or Italian saints discloses more than seventy offices, including those mentioned already and a set of twenty-one written for Milan by Origo Scaccabarozzi, and some twenty saints for whom there is an office with Italian connections. A good many of the "obviously" Italian offices are for saints quite local to their community; often, such a saint is the patron of the city in question—e.g., Ansanus of Siena, Petronius of Bologna, and Zeno of Verona. This emphasis on local saints mirrors the situation elsewhere but seems more prevalent in Italy.

Nothing obvious distinguishes Italian offices from those found elsewhere: the textual and musical styles seem consistent with general late medieval poetic and musical practice. But that practice, as it applies to both liturgical poetry and music, has yet to be investigated and established in detail, and all assessments must for the moment be purely subjective and based on incomplete evidence.

There are very dated editions and discussions of the offices for Francis of Assisi and Anthony of Padua, and there is an edition of the office for the patron of Volterra, Iuvenal of Fossano (Damilano 1979). No general survey of Italian offices exists as of this writing. Much general information can, however, be extracted from the catalog of late medieval offices in Hughes (1994).

Rialto

The Rialto in Venice is the area and market located at the first bend in the Grand Canal. *Rivoalto* ("deep water") originally referred to the entire archipelago of islands that later became Venice. The market district appropriated the name, since it was situated on the Canale de Rivo Alto, or Grand Canal. Merchants began to gather on the west shore of the canal bend as early as the late tenth century. Over the course of the next two centuries, the Rialto market became the bustling hub for Venetian export and import traffic. The first wooden bridge was probably built in the 1220s.

Riccardo Da San Germano

The chronicler Riccardo da San Germano (c. 1165-c. 1244) was closely connected with the abbey of Monte Cassino and the court of the

emperor Frederick II. Though not a churchman, being a notary by profession, Riccardo was almost certainly educated as a lay student at the monastery of Monte Cassino under Pietro da Insula, its abbot from 1174 on.

Riccardo's chronicle survives in two versions. In its original form it was probably intended to be a continuation of *Annales casinenses*, the annals of Monte Cassino, having been commissioned by Stefano Marsicano before Stefano became abbot of the monastery in 1215. It was begun in all likelihood between 1211 and 1215, while Riccardo was at the papal court in Rome, and was later expanded during his service as an imperial administrator into a more general history of the kingdom of Sicily between 1189 and 1243. Together with his brother, Giovanni, Riccardo is recorded as an official of Frederick II's government between 1222 and 1242, but he also continued over these years to act as a notary for the abbey of Monte Cassino. Despite his employment by the emperor, Riccardo is not entirely uncritical of Frederick in his account of events: he reserves his admiration for Pope Innocent III and King William II of Sicily. Still, he is critical of attempts by the papacy to override secular authority, retaining his attachment to the traditions of the Norman kingdoms of Sicily and avoiding commitment to the pro-papal and pro-imperial parties as they emerged at the end of his life. An interesting feature of his chronicle is the interpolation of verse passages, generally dirges on the deaths of great men or laments over tragic events such as the defeat of the crusaders at Damietta.

Ricciardo Da Battifolle

The poet Ricciardo da Battifolle (fourteenth century), according to the late nineteenth-century critic and poet Giosuè Carducci (1862), was also known as Roberto. He was the brother of Carlo di Poppi, and was a member of an illustrious family—the Conti Guidi from the Casentino region of Tuscany. Corsi (1969) cautiously follows Carducci's opinion and maintains that Ricciardo Roberto was a prominent military figure who corresponded with Petrarch (*Seniles*, 6 and 7) and Coluccio Salutati (*Epistolario*, 2.xv). He was friendly with Simone Serdini, who sent him a *canzone*, *Domine, né in furore tuo arguas me*. Roberto is also mentioned in Giovanni Gherardi's *Paradiso degli Alberti*. If Ricciardo is the same person as Roberto, he is renowned as the captain of the Florentine army that captured San Miniato in 1370, during the campaign against the Visconti, and he died in 1374. However, Lanza (1975) disagrees with Carducci and Corsi for chronological reasons and identifies the poet as the *conte Ricciardo come buon compagno* who is mentioned in *il Za*'s popular poem *Buca di Montemorello*.

Ricciardo is a Petrarchan poet, as can be seen in the sonnet *Benché ignorante sia, i'pur mi penso*, which he sent to Petrarch. In this poem, Ricciardo praises the courage and wisdom of the ancients and underscores his own sense of isolation and dissatisfaction with the present age. His only solace is in being a contemporary of Petrarch, whose eloquent verse provides him with spiritual guidance in the journey of life. Petrarch responded with the sonnet *Conte Ricciardo, quanto più ripenso*. All of Ricciardo's poems deal with the theme of love. Two sonnets, *Lieta finestra, avventuroso loco* and *Amor parla con meco e dice*: —*Or mira*, stand out for their lighthearted, vibrant, sincere representations of the poet's love for a woman named Filippa.

Ricciardo Petroni Da Siena

Ricciardo (a. 1314), a doctor of canon and civil law, is thought to have joined the papal chancery after a career teaching canon law at the University of Naples. He acted as vice-chancellor under Pietro da Piperno. In 1296, Pope Boniface VIII named him to work with Bérengar Frédol and Guillaume de Mandegout on the *Liber sextus decretalium*. Following the completion of this project, the pope named Ricciardo a cardinal. Ricciardo fled Anagni during the attack on Pope Boniface but remained active in the curia until his death. Ricciardo refused to verify any miracles attributed to Celestine V during the canonization inquiry inaugurated by Clement V.

Riccobaldo Da Ferrara

Riccobaldo da Ferrara (b. 1245 or 1246) was a compiler of chronicles of world history. He was born in Ferrara, became a notary, and styled himself *magister* or *dominus*. As an exile in Ravenna, he read a book in the capitular library of that city; this book inspired him to undertake his own lifework: Jerome's translation of Eusebius's *Chronicle*. Riccobaldo decided not only to make Eusebius's work known but to bring its treatment of events down to his own day. He thus represented a much older tradition than that of Vincent of Beauvais, the Dominican who inspired Riccobaldo's contemporaries Benzo d'Alessandria and Giovanni Mansionario. For the rest of his life, about twenty years or so, in Ravenna, Ferrara, and finally in Padua, Riccobaldo would devote himself to his chronological labor.

The first product of his industry was *Pomerium Ravennatis ecclesie, seu Historia universalis ab anno circiter 700-1297*, written in Ravenna between 1297 and 1300. On returning to Ferrara in 1308, he wrote *Compendium Romane historie*. In the second decade of the *Trecento*, he lived in Padua and wrote a two-volume treatment of Roman history (in the broadest sense), apparently entitled *Historie*, with the break between the two volumes coming at the inception of Caesar's political life.

To many scholars, Riccobaldo is most intriguing for his influence on Dante, especially the episode in the *Inferno* (Canto 27, verses 67-111, 115) involving Guido da Montefeltro and Boniface VIII.

Richard I, Count of Aversa

Richard I, count of Aversa and prince of Capua (d. 1078), was [he nephew of Rainulf, the first count of Aversa. By the mid-tenth century, the conquests of the Normans were proceeding in all directions. Humphrey de Hauteville continued the conquests of his brothers, William and Drogo; Robert Guiscard, aided by his younger brother Roger, moved southward into Calabria; and Richard of Aversa commenced his policy of expansion into the territories of Gisulf of Salerno, the duke of Gaeta, and the count of Aquino.

After the mysterious disappearance of Herman, a minor who was the son of Rainulf II of Aversa, Richard, who had been Herman's tutor, took over control of the county. From this base he was able to expand: first he came to the assistance of Gisulf II, the heir of the murdered Guaimar V (1052), and helped him to regain the principality of Salerno; second, he moved northward to regain control of Capua and to reinforce Gisulf's authority there. In 1053, Richard was one of the military leaders

at the battle of Civitate, which resulted in the imprisonment of Pope Leo IX (r. 1049-1054); and it was as leader of this army that he moved against the usurpers of Capua. At this point, Richard, feeling that he had not been adequately compensated by Gisulf II, broke with him and joined the forces of Amalfi against Salerno. But Richard, determined to capture Capua, laid siege to the city and abandoned the siege only when Pandulf V of Capua gave him a considerable sum of money. In 1057, when Pandulf V died and was succeeded by his son Landulf VI, Richard again took up the siege of Capua and this time forced an acknowledgment of his overlordship. This conquest was formally legitimized by Pope Nicholas II (r. 1058–1061) at the synod of Melfi (1059) in gratitude for Richard's support against the antipope Benedict X (1058). Shortly afterward, Richard also obtained an acknowledgment of his overlordship over Gaeta.

Having secured a base in Capua and Gaeta, Richard was free to enter into the politics of the time. From 1061 to 1063, for example, he found himself protector of Pope Alexander II (r. 1061-1073). At this time, Richard asserted his claim of suzerainty over all the petty nobles whose lands bordered his own, and in collaboration with Desiderius of Monte Cassino he tried to build up a state powerful enough to ensure peace among the warring nobility of the south. He was becoming too powerful for Alexander II, whose fears were confirmed in 1066, when Richard invaded the papal territories. At this point, the enemies of the pope were eager to proclaim Richard emperor. Although Alexander II and Richard were reconciled, it had become clear that courting the favor of the Normans was a dangerous policy on the part of the papacy. Pope Gregory VII (r. 1073-1085), Alexander's successor, pursued an aggressive anti-Norman policy when papal territory (Benevento) was attacked. Richard was excommunicated at the Council of Rome in March 1078 and died the next month on 5 April.

Richard of Venosa

The witty and talented Richard of Venosa (early thirteenth century) is known solely from his Latin poem *De Paulino et Polla* (*On Paulinus and Polla*), dedicated to the emperor Frederick II. This poem, in elegiac distichs, has 1,140 lines and is thus the longest extant specimen of "elegiac comedy," a type of dramatically charged humorous verse narrative whose earliest and most famous exemplars are known or thought to come from twelfth-century France.

In the opening of the poem, Richard identifies himself as a judge whose town of origin is Venosa, part of the mainland portion of Frederick's kingdom of Sicily. Venosa is also the scene of the action until the very end, when the amusingly told series of increasingly serious events is resolved at an unspecified location by "Duke Rainald," governor of the kingdom. This person's identification with Rainald of Urslingen, who was imperial vicar in 1228-1229 and was formally disgraced in 1231, provides an approximate date of composition. Richard's assimilation and creative reuse of ancient and modern classics, his choice of genre, and his skill at writing quantitative Latin verse in an antique manner mark him as someone of considerable literary culture. Also apparent are his higher education generally, his legal training, and his awareness of some of the less admirable aspects of human behavior.

The poem recounts how Polla, an elderly woman, asks the lawyer Fulco to arrange a marriage between her and an even older man, his acquaintance Paulinus. After some discussion, Fulco accepts the commission, and in attempting to fulfill it he falls prey to a series of mishaps ranging from slapstick to seriocomic. In addition to damage

caused by his domestic animals (cat, dog, and pig), his misfortunes include ruining his bed by accidentally spilling oil all over the straw, falling into an open sewer and not being able to get himself out, and being tried and sentenced to death for a crime he did not commit. Two versions of the ending exist. In one of these—an abbreviated version—Fulco's future and that of the proposed marriage are left in doubt, although a two-line happy ending has been added in some manuscripts. In the other version—which is presumably the original—the duke quashes the local proceeding but forbids the marriage, since, as Fulco has admitted, no offspring can come of it; and Fulco is condemned to a severe beating for promoting an illicit union.

Embedded in the narrative and giving the work most of its length are numerous passages of dialogue. These usually take the form of relatively brief, sententious exchanges dealing with two sides of an issue. The issues themselves are pragmatic and chiefly ethical; the transitions are clever and often involve amusing situations. There is also an element of social satire. The poem's pedagogically attractive combination of moral content in an entertaining and well-written vehicle seems to have been the key to its survival. Thus quotations from it occur in the *Compendium moralium notabilium* (c. 1300–1310, an ethical florilegium) of the Paduan judge Jeremy (Hieremias, Geremia) of Montagnone; and the earliest complete manuscript (also from the first half of the fourteenth century) has thorough interlinear and marginal glosses indicative of schoolroom use. Of at least eleven later manuscripts, several are similarly glossed.

Richard I, the Lion-Heart

Richard (1157-1199), the third child of King Henry II and Eleanor of Aquitaine, succeeded to the English throne at his father's death on 16 July 1189 and immediately began raising money for a crusade, which became the central focus of his life. Richard left England on 12 December 1189 and sailed from Marseille for the east on 7 August 1190. On his journey to the Levant, he spent the period from 13 August 1190 to 10 April 1191 in Italy and Sicily—a greater time, in fact, than he spent

in England during the ten years of his reign as its king. Richard stopped at Genoa, Portofino, Pisa, Piombino, Ostia, Naples, and Salerno, among other cities in the peninsula, but he declined an invitation from the pope to visit Rome. At Messina, Richard became involved in a confrontation with King Tancred of Sicily over property that Richard claimed belonged rightfully to his sister, Joan. In a brief campaign, Richard captured Messina and held it for ransom until Tancred finally bowed to his demands.

Arriving in the Holy Land at the beginning of June 1191, Richard soon took control of the siege of Acre. He spent sixteen months campaigning in the east and then set out for England in October 1192. On his return journey he was captured and held for ransom, first by Duke Leopold of Austria and then by Emperor Henry VI. He was released in 1194 after payment of a substantial ransom; he then spent the next five years in struggles with King Philip II of France over territories that both claimed and neither would concede to the other. Richard died, still fighting, on 6 April 1199.

Flavius Ricimer (Count Ricimer, d. 472), was of varied royal barbarian ancestry, being the son of a Visigothic mother and a Suevic father. He pursued a military career and served under Aetius. As a military count, he defeated a Vandal attack on Sicily in 456. During the period 456—472, acting in the capacity of patrician and supreme master of soldiers, he was the virtual ruler of the western empire, making and unmaking emperors at will. In 456, he was involved in the fall of the emperor Eparchius Avitus. In 457, he was instrumental in the accession of the energetic emperor Majorian (r. 457-461), but in 461 he had Majorian deposed and subsequently executed at Dertona. Later that year, he had the nonentity Libius Severus declared emperor in Rome; Severus occupied the throne until his unlamented death in 465.

The west then remained without an emperor, but with Ricimer effectively in control, until 467, when an easterner, Anthemius, arrived with an army and was made emperor. In an attempt to reach an accord with the new emperor, Ricimer married Anthemius's daughter Alypia. Nevertheless, quarreling soon broke out, culminating in the murder of Anthemius, in 472, by Ricimer's nephew, the Burgundian Gundobad. Ricimer then had the senator Olybrius proclaimed western emperor. Ricimer died shortly thereafter, and his influential position was then occupied by Gundobad.

Ricimer was one of several barbarians who took advantage of the troubled times in the west to attain great influence and high office, but whose pursuit of essentially personal ambitions contributed to the eventual disintegration of the west.

Rimini

Rimini was the ancient coastal city of Ariminum, situated on the border between Emilia and Umbria. It was the end of Via Flaminia and the beginning of Via Aemilia, marked by the Arch of Augustus, the earliest surviving Roman triumphal arch (27 B.C.). Its prehistoric background included elements of Villanovian, Umbrian, and Etruscan culture. In 268 B.C., it was consolidated as a Roman colony. From the second Punic war until the late empire, Rimini was a major Roman military and maritime base. The Christian church in Rimini can be dated to its first known bishop, Stemmio (313). After the Byzantine reconquest, the city became a part of the Exarchate (552). Following rule by the Lombards and conquest by the Franks, it was part of the Donation of Pepin to the papacy.

The earliest forms of communal government appear to date from the eleventh century, and the first consuls are documented in 1158. Frederick I Barbarossa recognized the city and its rights over its surrounding territory. In 1295, after a series of struggles between the Guelph Malatesta family and the Ghibelline Omodei and Parcitadi families, the Malatesta established their rule—or *signoria*—in the city, under Malatesta da Verrucchio (d. 1312), with the assistance of his sons Paolo Bello, Gianciotto, and Malatestino *dall'occhio* ("one-eyed"). In the *Divine Comedy*, Dante mentions these historical figures and severely criticizes them for their violent tactics. First, Dante describes the

murder of Francesca da Polenta (from Ravenna) and Paolo Malatesta by her husband Gianciotto, Paolo's brother (*Inferno*, 5.82-142). Then he condemns the premeditated murder of the Ghibelline Montagna dei Parcitadi by the Malatesta family (*Inferno*, 27.46-48) as part of their plan for consolidating their power in Rimini. Finally, Dante refers to Malatestino's treacherous drowning of two civic representatives from Fano as part of the expansionist designs of the Malatesta family on other cities in the area (*Inferno*, 28.70-90). One further note on Dante's connection with Rimini is that his strong antipapal political views, as expressed in *Monarchia*, come under harsh attack by the Dominican Guido Vernani da Rimini in the treatise *Tractatus de reprobatione Monarchiae* (1333-1334).

The Malatesta lordship was recognized anew by the city council in 1334 and received recognition from the papacy in 1355 as a vicariate over Rimini, Pesaro, Fano, and Fossombrone. The continuing Malatesta court became a center of cultural patronage, reaching a peak in the days of Sigismondo Pandolfo in the fifteenth century. The seriousness of its intellectual interests may be measured by the fact that Pandolfo Malatesta was a friend and patron of Petrarch (Francesco Petrarca) and that a century later, in the early Renaissance, Sigismondo commissioned Leon Battista Alberti to design the celebrated Tempio Malatestiano.

The splendor of the Tempio tends to distract attention from the medieval edifices in Rimini, which include the Palazzo dell'-Arengo (Palatium Communis), a Romanesque-Gothic structure begun in 1204; and the Palazzo del Podesta (Palatium Novum), built in the 1330s. There are also several fine medieval churches, such as Sant'Agostino (1247), with its fourteenth-century fresco cycle, and the church of the Senates (Santa Maria dei Servi, 1317); the latter, however, has been greatly altered over the centuries.

Rimini, School of

In the late Middle Ages, Rimini was a major center for the production of fresco and panel painting. Although the output of the school of Rimini came largely during the first half of the fourteenth century, its artists are recorded in local archives from 1292 until the late *Trecento*. Modern scholars have attempted to arrange the substantial body of surviving work, most of which is anonymous, into stylistic groups, each group representing a separate artistic personality; a few signed and dated works make it possible to attach names to some of these personalities and to establish approximate dates for their activity. The task of organizing the material is complicated by its homogeneity, and there is considerable disagreement among the critics.

The most important artists whose names are known today are Giuliano da Rimini, Pietro da Rimini, Giovanni da Rimini, and Giovanni Baronzio. Giuliano signed an altarpiece that was once in the

duomo at Urbania, near Urbino, and is now in the Gardner Museum in Boston; this panel also carries the date 1307 and is the earliest dated work from the school. Giuliano was dead by 1346; it is likely that he is the same Giuliano da Rimini who worked in Padua in 1324, along with Pietro da Rimini. They signed and dated an altarpiece (now lost) that was once in the church of the Eremitani in Padua. Some detached frescoes in the civic museum come from the Eremitani and may be attributed to this team of artists. There is a signed crucifix by Pietro da Rimini at Urbania. A painter named Giovanni signed and dated another crucifix at Mercatello. The date, which is indistinct, is now read as 1309 or 1314 (not 1345, as it was previously read). This Giovanni is apparently the same artist whose name appears on Riminese archival documents of 1292 and 1300, but he is not the Giovanni Baronzio who signed the dated polyptych of 1345 in the National Gallery of the Marches at Urbino. Little more is known of Baronzio, except that he had died by 1362. Baronzio is the last major artist of the Riminese school whose name is known—if indeed he is a major artist, for by his time the school appears to have entered into a decline.

Approximately 100 paintings on panel by the Riminese artists have been identified. Among the best and most characteristic are rectangular altarpieces and small portable diptychs, divided into zones most often decorated with scenes of Christ's passion, and frequently now dismembered. In addition, there are numerous fresco cycles. Of these, the most extensive are stories of Joachim, the Virgin, and the infancy of Christ, in the Cappella del Campanile, Sant'Agostino, Rimini (heavily damaged); scenes from the legend of Saint John the Evangelist and other subjects, in the choir of the same church (also in poor condition, particularly in the lower registers); and scenes from the lives of Christ, Mary, and Saint Nicholas of Tolentino in the Cappellone di San Nicola at Tolentino. Another major fresco decoration, at Santa Maria in Porto Fuori in Ravenna, was destroyed during World War II.

The painters of Rimini drew their inspiration from a variety of sources. At first, local Romanesque and Byzantine styles were combined with the new manner which was created around the turn of the century from Roman and Florentine elements at the basilica of San Francesco at Assisi, particularly the celebrated series of frescoes from the legend of Saint Francis in the upper church. Riminese artists also

may have been influenced by Pietro Cavallini, although he did not work at Assisi. Frescoes by close early followers of Giotto in the lower church at Assisi left their imprint on the school, especially those in the Saint Nicholas Chapel and the right transept. Works in Florence by Giotto and his contemporaries, especially those of a less monumental and more episodic tendency than Giotto—such as the Saint Cecilia Master who also worked at Assisi—were known to the Riminese. Reflections of Pietro Lorenzetti's frescoes of the passion in the lower church at Assisi can be seen in Riminese *Trecento* art; and occasional resemblances to works by other Sienese artists of the first half of the fourteenth century, particularly Duccio, may be due to direct influence and not to Byzantine or other common sources. Direct borrowings from Giotto's decoration of the Arena Chapel also appear. And finally, in a passage probably written in 1312 or 1313, the chronicler Riccobaldo da Ferrara mentioned work by Giotto in San Francesco at Rimini. A dismembered crucifix is in that church today, and it was surely painted by Giotto himself, although it is often not considered autograph. This type of crucifix became popular with local painters, and there are many examples, including those by Pietro da Rimini and Giovanni mentioned above, that show its influence. It is often suggested that Riccobaldo was referring not to the crucifix but to some frescoes in San Francesco when he mentioned Giotto's work there. According to this claim, which unfortunately cannot be substantiated, the frescoes were destroyed when the church was remodeled in the mid-fifteenth century. Proponents of this theory hold that indications of Giotto's lost frescoes appear in the native school.

Generally, the Riminese school achieved a synthesis of the measured gravity of its Roman and Florentine sources and the less restrained emotion of the Sienese, while at the same time exceeding them in its popular realism. The school was an important vehicle for the transmission of Roman and Tuscan style and iconography to the great centers of northern Italy. Riminese influence was widespread throughout the Marches, Emilia, Romagna, and the Veneto.

Rinaldo D'Aquino

The poet Rinaldo d Aquino (thirteenth century) has the title *messere* in the ancient codices. He was descended from a prominent aristocratic family, but during his time there were several families of the same name, so that a precise identification is virtually impossible. It has been suggested that Rinaldo was a brother of Saint Thomas Aquinas (Tommaso d' Aquino). In 1243 or 1244, Rinaldo assisted Pier delia Vigna in organizing the forced return of Thomas Aquinas to his castle at San Giovanni. Some scholars believe that it is the same Rinaldo who served as Emperor Frederick II's falconer in February 1240, Chronological considerations tend to rule out identifying Rinaldo with the lord of Roccasecca, who was a partisan of Charles dAnjou in 1275 and was accused by his vassals of seducing their wives. However, Torraca (1902) considers the falconer of 1240 to be the same person who, years later, betrayed Manfred and swore allegiance to the house of Anjou. Internal evidence, such as a brief mention of the town of Montella and a vague reference to a crusade, has no biographical implications.

Whatever his identity, Rinaldo d'Aquino ranks among the earliest and most prominent poets of the Sicilian school. He engaged in a poetic correspondence with Giacomo da Lentini; and Rinaldo's *canzorti*, second in number only to Giacomo's, have a conspicuous place in the

Vatican Codex (Lat. 3793). Rinaldo is mentioned twice by Dante, who quotes his poem *Per fin' amore vao sì allegramente* among the examples of *cantiones illustres*. Rinaldo is noted for his rhetorical skills but is a close follower of troubadour themes and styles rather than an innovator. He was praised during the Romantic era for what seemed to be a popularizing vein in his lament *Già mai non mi conforto*; however, the theme of a girl abandoned by her lover, who is departing on a crusade, is strictly conventional, hailing back to the Gascon troubadour Marcabru (fl. c. 1130-1148), and the poem contains many lexical items that are refined and Provençalizing.

Ristoro D'Arezzo

What little information we have about the life of Ristoro d'Arezzo (thirteenth century) is obtained from his only work, *Composizione del mondo colle sue cascioni*, which has come down to us in five manuscripts. He was an adult in 1239, when he viewed a total eclipse of the sun. He was apparently a monk, and he compiled his treatise in 1282, in the dialect of Arezzo.

Ristoro's treatise is divided into two books: the first book consists of twenty-four chapters; the second is subdivided into eight divisions (*distinzioni*) that are in turn subdivided into chapters. The expansion into eight divisions shows Ristoro's attempt at proportion; however, the symmetry of the outer sections contrasts with the lack of form of the inner chapters. Ristoro's cosmological compilation is easily assignable to the category of encyclopedias; indeed, Ristoro states as his purpose in writing the treatise that human beings, the most noble creatures in the world, may "know, understand, comprehend, hear, and see the marvelous works of this world" and, further, that they may recognize in all these works the hand of God, their creator (1.1.4). This programmatic beginning manifests itself in two recurrent ideas: first, that the world should be described as it is; and second, that this description should be tied to the question of why the world is as it is. Ristoro chooses to follow the classical path leading from macrocosm to microcosm. The first book describes only the visible manifestations of divine creation, in a process that moves from the heavenly spheres to the culmination of creation, mankind; the second book treats, through causal analysis, the phenomena that have already been described.

Ristoro does not always name his many sources. Moreover, his knowledge of Aristotle, Ptolemy, Abdumaser, Averroes, Avicenna, and Alfraganus does not necessarily derive from a reading of the original texts (or from their Latin translations); he may have had recourse to florilegia and compendiums. The dissemination of Ristoro's text was restricted to narrow geographical limits, but influences on Dante and later on Leon Battista Alberti and Leonardo da Vinci can be demonstrated.

Ristoro's work occupies a middle position in the development of the

encyclopedia, which had Isidore of Seville and the Venerable Bede as its first medieval representatives and continued to develop through the rediscovery of ancient Greek knowledge until it eventually emerged in the great *Specula* of Vincent of Beauvais and the *Summa* of Thomas Aquinas.

The *Ritmo cassinese* is the work of a jongleur who describes in allegorical terms an encounter between two men, one from the west and one from the east. The work is contained in an eleventh-century manuscript (552-32) in the abbey of Monte Cassino but is written in a later hand, of either the late twelfth or the early thirteenth century. The poem is in what can be generally called a central-southern Italian dialect; it has ninety-six verses, which are divided into twelve strophes of different lengths. Each stanza is based on two rhymes; a varying number of shorter monorhymed verses (usually *ottonari*) and a concluding couplet (or sometimes three verses) of longer monorhymed verses (generally *endecasillabi*). The text of the *Ritmo* is fraught with metrical, linguistic, and interpretive problems, all bearing on its ultimate interpretation, which can in no sense be said to be resolved.

The poet begins with an exordium to his audience—*Eo, siniuri, s'eo fabello, llo bostru audire compello* ("If I speak, my lords, I ask for your attention")—and proceeds to speak, in general terms, about his subject: *de questa bita interpello / e ddell'altra bene spello* ("I pose questions about this life and speak well of the other [life]"). In the first three stanzas, the poet sets the stage for his presentation of the two kinds of "life" by using phrases such as *por vebe luminaria factio* ("I will shed light for you," i.e., "I will illuminate you") and terms such as *scriptura* (scripture, i.e., his Latin source, perhaps the Bible) and *fegura* (figure, allegory, or possibly "picture" or "drawing," which has given rise to speculation about the possible use of visual aids by the jongleur). The bulk of the third stanza focuses on the attractions of "this" life and assumes a sermon-like quality: *Ai, dumque pentia null'omo fare / questa bita reguare, / deducere, deportare ... / Mort'è, non guita gustare, / cunqua de questa sia pare. / Ma tantu quistu mundu è gaudebele, / ke l'unu e ll'altru face mescredebele* ("Ah, no one thinks to lead a regulated life, [but] to amuse and enjoy oneself. ... It is death, not life, to enjoy whatever may be similar to this [life]. But this world is so pleasurable that it causes people to not believe the one and the other"—i.e., not to see what is truly good in this life and consequently not to believe in the other life, for which this life is a preparation).

In the fourth stanza the poet presents the two protagonists: the man from the east (*sse mosse d'Orientel unu magnu vir prudente*) and the man from the west (*d'Occidente*). The last eight stanzas contain the

conversation between these two figures, which concentrates almost exclusively on what sort of food the man from the east enjoys. The man from the west asks: *Poi ke 'n tale destuttu state, / quale bita bui menate? / Que bidande mandicate? / Abete bidande cuscì amorse, / como queste nostre saporose?* ("Since you are in such a state of delight, what sort of life do you lead? What foods do you eat? Do you have such delicious and attractive foods as we have?"). And the man of the east responds: *Ei, parabola dissensata! . . . Bidand' abemo purgata, / d'ab enitiupreparata: /perfecta binja plantata / de tuttu tempu fructata. / En qualecumqua causa delectamo, / tutt' a quella bijna lo trobamo, / e ppuru de bedere ni satiamo* ("Ah, senseless word! We have pure food prepared from the beginning of time: a perfect vine, planted and constantly bearing fruit. Whatever we desire we find at that vine, and we are satisfied only by gazing upon it"). The man from the west concludes that they do not eat (*Ergo non mandicate?*) and goes on to say that anyone who does not eat or drink cannot have any pleasure whatsoever (*Homo ki nnim bebe ni manducal non sactio com'unqua se deduca*). The man from the east responds by noting that if one is not hungry or thirsty, there is no need to eat or drink (*Homo ki fame unqua non sentel(non è sitiente) / qued à besonju, tebe saccente, / de mandicare, de bibere niente?*). In the twelfth and final strophe, the man from the west—and therefore also the audience—finally understands the hidden meaning when he says: *Poi ke'n tanta gloria sedete, / nullu necessu v'abete, / ma quantumqu'a Deu petite, / tuttu lo 'm balia tenete, / et em quella forma bui gaudete, / angeli de celu sete!* ("Since you are seated in such glory, you need nothing, but whatever you ask from God, you receive, and in that condition you rejoice; truly you are angels from heaven!").

On a very basic level, the poem is about the difference between life on earth and life in heaven, or between secular and monastic life on earth, but it also lends itself to several other interpretations. Given their identification with spatial locations—the east and the west—the two protagonists may be interpreted as representatives of two monastic orders, the Basilians and the Benedictines; or perhaps of two divisions within the Benedictine order: those who follow the rule and those who observe it less strictly. In the tradition of medieval debate poems, the *Ritmo cassinese* could also be a contrast between personifications of

"body" and "soul" or between representatives of the "active life" (*vita pratical attiva*) and the "contemplative life" (*vita contemplativa*). Given the didactic tone of the poem, the dialogue could also be between a "mystic" (from the east) and a "neophyte" (from the west). However that may be, one thing is obvious: the man from the east has the upper hand in the discussion; and thus whatever his significance is, that is what the poet is attempting to impart to the audience. The lesson of the *Ritmo*, then, is that one should rise above the material world and its illusory temptations to embrace what is true in the spiritual world; that earthly pleasures are insufficient and lead not to life but to death; and that one can attain an angelic state by observing certain ascetic practices (e.g., monastic fasting).

Ritmo Di Sant'Alessio

The *Ritmo di Sant'Alessio* is a metric life of Saint Alexis, composed by a religious jongleur, probably at the end of the twelfth century, and meant to be recited in public. The legend of Saint Alexis originated as early as the first half of the fifth century in Edessa (now Urfa, Turkey), the former capital of the Aramaic kingdom of Osroene, where Christianity had spread since the beginning of the third century. From there the legend moved on to Byzantium and finally reached Italy and western Europe, where the Benedictine order promoted and appropriated the Cult of the saint. A Latin prose life of the tenth century, adapted from Greek, became the source of all Latin and vernacular accounts composed thereafter in the west, including a famous French poem (*Vie de Saint Alexis*, eleventh century) and Bonvesin's *De vita Beati Alexii* in Lombard verse (thirteenth century).

The *Ritmo*, which has come down to us in an incomplete form, is preserved in a manuscript (now in the Civic Library of Ascoli Piceno, XXV A. 51, c. 130 f.) originally belonging to the Benedictine convent of Santa Vittoria in Matenano, a Farfa foundation near Fermo, also in the southern Marches. The narrative tempo is quite slow: after 257 lines the story breaks off at Edessa, before the arrival of Euphernian's servants. The lines are divided into twenty-seven stanzas in which an indefinite number (from four to thirteen) of shorter verses (octo- or novenaries) echoing the same rhyme are normally followed by a couplet of deca- or hendecasyllabic verses featuring a different rhyme, tendentiously

equivocal (i.e., rich or even homonymic). The metric measures can be traced back to the octosyllables and decasyllabics of Occitan and Old French poetry.

Linguistically, the *Ritmo* belongs to "a koiné of East Central Italy, whose cultural capital was undoubtedly Montecassino" (Contini 1960). Because of their geographic and chronological proximity, their metric and linguistic affinities, and the fact that they were produced in the same Benedictine milieu, the *Ritmo di Sant'Alessio* and the *Ritmo Cassinese* are to be considered strictly related; they are both monastic texts written in a jongleuresque form for purposes of popularization.

Robert Guiscard

When Robert Guiscard (Robert de Hauteville, c. 1015-1085) rode into southern Italy in 1047, Norman mercenaries had been playing Lombards against Byzantines there for at least thirty years. Robert's half brothers, older sons of Tancred of Hauteville, had already claimed lands around Aversa, where the eldest, William, had earned the name "Iron-Arm" and had become the first Norman Italian count. William did not welcome Robert's arrival. Eventually another brother, Drogo, gave Robert a miserable outpost in Calabria, which he could control only by ousting the Byzantines. Yet this offered him a base from which to launch ambitious conquests, achieved with prodigious energy. Robert used terror and bloodshed, but his signature strategy was the ruse, as when he allegedly feigned death and penetrated a monastic stronghold inside a coffin, lying on a bed of swords. So wily was this trickster that the name Guiscard ("the clever") was used in the eleventh-century histories featuring his exploits.

Robert also proved his mettle on the battlefield. In 1053, a formidable coalition of Germans from the Holy Roman Empire and their Italian allies, led by Pope Leo IX, engaged the Normans at Civitate, hoping to dislodge them from Italy. Robert distinguished himself in this Norman victory, and soon he was challenging his brother Humphrey for hegemony among the Normans of Italy. Before Humphrey died in 1057, he commended his son Abelard to Robert's care, but Robert promptly claimed his nephew's lands. The boy would grow up to foment insurrections against his uncle but eventually sought asylum in Byzantium after yet another unsuccessful resistance in 1080. Such rebellions punctuated Robert's reign, even as he expanded his domination, seizing Capua from the Lombards and finally—in 1071, after a three-year siege—taking Bari, the last Byzantine foothold in Italy.

Along Robert's path to power, two events of 1059 enhanced his prestige and legitimized his authority. First, having repudiated his wife (the mother of his son, Bohemond), Robert compelled Prince Gisulf II of Salerno to surrender his sister Sichel gaita in marriage. Now linked to a venerable Lombard princely family, Robert also allied himself with the

papacy, which sought the support of the Normans in the investiture conflict against the Holy Roman emperor and the imperial antipope. Thus at the synod of Melfi, Robert—who had been thrice excommunicated—acquired a papal blessing and the title of duke of Apulia and Calabria and Sicily.

Before this, Robert had not even visited Muslim Sicily. Yet he now engineered a reconquest increasingly dominated by his younger brother, Roger. Messina fell in 1061, followed by Palermo in 1072. But rebellions in Italy forced Robert to return there, effectively leaving Sicily to Roger. Robert, meanwhile, trained his eye on Byzantium, made enticingly vulnerable by dynastic struggles and the advance of the Seljuk Turks. Emperor Michael VII, desperate for aid from the Normans, had even betrothed his son to Robert's daughter. After Michael was dethroned in a coup in 1078, Robert invoked kinship as a pretext for invading Byzantium. Yet once again Italy drew him back from the campaign, this time to rescue Pope Gregory VII from the Holy Roman emperor Henry IV, who had seized Rome and deposed Gregory. In a mission notorious for its violence and for the alleged burning of Rome, Robert retrieved the pope and took him to Salerno, where he died in May 1085. Robert resumed his Byzantine offensive, taking Corfu while his younger son Roger accompanied Norman forces to the mainland. But Robert died suddenly, on 17 July 1085, when an epidemic of typhoid fever swept through his army. Roger's army promptly deserted, while Sichelgaita took Robert's body to Venosa for burial next to his older brothers in the church of the Holy Trinity. In the twelfth century, his grave attracted a suitable epitaph, which began: "Here lies the terror of the world, Guiscard."

Robert of Anjou

Robert of Anjou, king of Naples ("the Wise," 1278-1343; r. 1309-1343)

was the third son of Charles II of Anjou. Robert was held hostage by the Aragonese from 1285 to 1295. He was created duke of Calabria and vicar of the Regno for his father in 1297, and he became prince of Salerno in 1304. Robert succeeded as king of Sicily and count of Piedmont, Provence, and Forcalquier in 1309, despite the claims of his eldest brother's son, Carobert. Robert's two wives were Violante of Aragon, sister of James II; and Sancia of Aragon, daughter of James II. Robert was survived by two daughters, Joanna and Maria; the former succeeded him, becoming Queen Joanna I of Naples.

Robert became king as Emperor Henry VII was preparing an expedition to Italy to be crowned. The Guelf party, which opposed Henry's plans, looked to Robert for leadership, but initially he supported Pope Clement V, who hoped to form a partnership with Henry to bring peace to Italy. Clement, recognizing Robert's support, made him rector of the Romagna (excluding Bologna) in 1310 and supported a marriage alliance between Robert's heir and Henry's daughter. This alliance was never achieved, and relations worsened when Robert refused to do homage to Henry in person for Piedmont, Provence, and Forcalquier. Robert did not prevent Henry from reaching Rome and being crowned; but as the Guelfs' opposition to Henry grew, an army sent by Robert hastened the emperor's withdrawal. Robert became captain of the Guelf league in February 1313 and soon afterward accepted the lordship of numerous communes. In April 1313 he became lord of Florence for five years. Henry responded by condemning Robert, but Henry died in 1313 while marching on Florence, where an army sent by Robert was preparing to oppose him.

Meanwhile Frederick of Sicily, supporting Henry in this quarrel (which he had helped to precipitate), invaded Calabria, thereby breaking the peace of Caltabellotta. Robert repulsed him and thereafter made several unsuccessful attempts (in 1314, 1316, 1325-1326, 1335, and 1339-1342) to recover Sicily; these attempts further impoverished his already troubled realm, and despite his sincere efforts to impose good justice and administration, Robert perpetuated corruption and disorder.

The degree of Robert's failure to impose his ideal of good government is disputed, but that he failed is not in question.

Robert continued throughout his reign to be involved in politics farther north. In 1317, the Florentines renewed his lordship for four years. In 1325, he sanctioned an offer to make his son Charles of Calabria lord of Florence. Both Charles and Robert opposed the expedition by Emperor Lewis of Bavaria, not least because an alliance between Lewis and Frederick of Sicily posed a threat to the Regno.

Robert was religious to the point of bigotry and was detested by the northern Ghibellines, but in his own kingdom he was the most popular of the Angevin kings—a reputation for which his public works, especially in Naples, and his patronage of the arts and literature may have been partly responsible. Among those whom he patronized were Petrarch and Boccaccio. Simone Martini's picture of Robert worshipping his brother Louis is reputedly the first painted portrait in European art.

Roger I

Roger I, count of Sicily (1031–1101, r. 1085-1101), was the brother of Robert Guiscard and was largely responsible for the Norman conquest of Sicily. Roger had been campaigning there since at least 1061, when Messina had fallen, and he took the last Muslim stronghold, Noto, in 1091. He is said to have had only a handful of soldiers (just 130 knights at the battle of Cerami in 1063), but he became the most powerful figure in the south after his brother's death in 1085. Most scholars agree that Roger I laid the foundations for the later cohesion and wealth of the kingdom of Sicily.

Roger's comital activities can be partially reconstructed from evidence in surviving charters, most of which is published. At a meeting at Mazara in 1093, Roger and his followers divided up the conquered Muslims among their new lords using long lists known as *jara'ida*. One such list in favor of the cathedral at Catania in 1095 is extant in its original form, containing 345 names including fifty-three

widows. A grant of peasants made to Guiscard's son, Duke Roger, was confirmed by his uncle to the cathedral of Palermo in the same year. Another element of Roger's documented activity was granting the monks of Saint Philip at Fragala judicial rights over their peasants, a technique of local government that would be taken up and repeated by Roger II. Roger I's activities were not confined to the island of Sicily: his foundation of the monastery of the Holy Trinity at Mileto in Calabria in 1080-1081, including endowing the house with property and churches in Calabria and Sicily, is recorded in a surviving copy of the original charter. Some judicial rights also appear to have been granted to the abbot in 1093, and Roger confirmed further privileges in a surviving but undated charter. Indeed, Mileto remained his chief residence throughout his life. In 1093, he also clarified a grant and presided over a court case in the Calabrian town of Stilo, and he is recorded as the patron of Greek monks there in 1094 and 1097.

Roger had a mostly cordial relationship with Pope Urban II, and the two cooperated, though sometimes uneasily, regarding the reorganization of the church in Sicily, with the see of Troina transferred to Messina, and Syracuse and Catania given bishops. In an unusual concession, Roger was given responsibility for many of the duties that a papal legate would have undertaken on the island, after he had objected to Urban's appointment of the bishop of Messina to that dignity.

Roger married three times. His first wife, in 1061, was Judith (d. 1080), daughter of William d'Evreux, who is said to have commanded the defense of Troina. His second wife was Eremburga, daughter of William de Mortain. His third wife was Adelasia (d. 1118), daughter of the marquis Manfred of Savona; his and Adelasia's sons were Simon (d. 1105) and Roger II. In addition, Roger I had two illegitimate sons: Jordan, who predeceased his father in 1089; and Geoffrey, who suffered from leprosy. Roger died in 1101, and after a period of minority during which Adelasia governed, Simon and Roger II succeeded him as counts of Sicily.

Roger II

Roger II (1095-1154) created the twelfth-century kingdom of southern Italy and Sicily, known as the Regno. He was the son of Count Roger I of Sicily and his third wife, Adelaide (Adelasia) of Savona, later queen of Jerusalem. Roger I died in 1101, and Roger II succeeded his elder brother, Simon, in 1105. Once he reached his majority, Roger II pursued a clear objective—to accumulate mainland territories in southern Italy. He conquered Calabria in 1122; he succeeded his childless cousin William to the duchy of Apulia in 1127 and was formally recognized as duke of Apulia on 23 August 1128; he acquired the principality of Capua in 1129. Finally, in Palermo, on Christmas day 1130, Roger was crowned king of Sicily, Calabria, and Apulia. The title was conferred, however, by the antipope Anacletus II, following a papal schism. On 25 July 1139, Pope Innocent II made Roger's title official, crowning him king of Sicily, duke of Apulia, and prince of Capua.

According to one chronicler, the celebrations and ceremony for Roger's coronation in Palermo in 1130 were so spectacular that "it was as if the whole city were being crowned." Many scholars have considered Roger's reign equally extraordinary. He ruled over all of Italy south of the Garigliano River, down through Sicily. Although he did not inherit a unified kingdom, accustomed to monarchical rule, he created something resembling one. Roger's rule is impossible to describe easily, for it did not conform to contemporary models of medieval kingship. He bound together the disparate ethnic groups who populated the region. Their coexistence was a practical necessity. He constructed a central government in Palermo that borrowed from the economic, administrative, and legal traditions of his Arab, Norman, Greek, and Italian-Lombard subjects. Roger was the leading feudal lord among feudal lords. He laid the groundwork for *Catalogus baronum*, the list of financial and military obligations owed to the crown by many of his barons. Arab-inspired offices were created to manage finances. A French-inspired chancery, overseen by a chamberlain, issued official court documents in Greek, Arabic, and Latin. A permanent Greek-style bureaucracy or civil service, based in Palermo, helped to manage the vast kingdom. Finally, the king himself, no doubt drawing inspiration from the Byzantium of Justinian, presented himself as a divinely appointed ruler. (Like Justinian, Roger may also have been a lawgiver. A law code, erroneously called the *Assises of Ariano*, has been attributed to him, but more recent scholarship disputes this.)

However one chooses to characterize the kingship of Roger II, he was undeniably successful. Periodic opposition to his rule—in particular, vassal rebellions led by his brother-in-law Rainulf— never lasted long. His foreign policy revealed ambitions, perhaps to expand his kingdom but more likely to safeguard it against external attack. He added much of North Africa to his kingdom while holding off threats from the Greeks, the northern Italians, and the German empire. He maintained a considerable war chest to support his army and navy. Roger's accomplishments did not go unnoticed: a contemporary observed that Roger "did more asleep than others did awake."

Roger II's personality and lineage should not be ignored in assessing his reign. He was described as the fairly stereotypical "Viking" warrior: tall, loud, regal, ruthless, and skilled from childhood on. Roger's

upbringing was anything but standard: he was probably raised in the royal court at Mileto in Calabria, where he was schooled in Greek and Arabic. When he was king, his court at Palermo was famous for its eclectic group of western and eastern intellectuals. This tradition continued in Sicily long after Roger's death.

When Roger died, at age fifty-eight, he was survived by his third wife, Beatrice of Rethel, and their new daughter, Constance. Constance would eventually marry the son of Frederick I Barbarossa, Henry VI, thereby uniting the Norman and Hohenstaufen lines. In 1151, before his death, Roger had ensured the succession by naming and crowning as his heir his fourth son (his oldest surviving son), William I. William's mother was Roger's first wife, Elvira, daughter of Alfonso VI of Castille. A modern historian summed up Roger's reign by noting, "From his father he had inherited a county; to his son he bequeathed a kingdom." This kingdom would endure, largely intact, under the guidance of his son and grandson, William I and William II. They inherited the tradition of a strong, centralized monarchical rule established by their illustrious forebear.

Older scholarship proclaimed that Roger II had created the "first modern state." More recent work has suggested that the kingdom was not so unified as had previously been thought, and that Roger's apparent acceptance of the different cultures over which he ruled was motivated more by political expediency than by laudable tolerance. Roger's reign was an "absolute" monarchy that recognized the weaknesses of this unique kingdom and harnessed its strengths: a large geographic territory, surrounded by ambitious and watchful neighbors, and populated by people of vastly different religious, cultural, and administrative backgrounds. Roger II encouraged tolerance in this multiethnic state when it was politically necessary; overall, he expected strict obedience to his rule.

Roger's last wish, to be buried in the cathedral of Cefalù, which he had founded in 1131 outside Palermo, was not granted; he rests in the cathedral at Palermo. Nevertheless, the fusion of eastern and western architectural and artistic elements at Cefalù reflects the character of Roger's reign: innovative and intimidating political authority set against a glittering backdrop of cultural assimilation and coexistence.

Roger Borsa

Roger Borsa (r. 1085-1111) succeeded his father, Robert Guiscard (r. 1047-1085), as duke of Apulia when Robert, who was about to embark on his conquest of the Byzantine empire, died on 17 July 1085. Roger's mother, Sykelgaita (Sichelgaita), did everything she could to sustain Roger, having always favored him over his half brother Bohemond (d. 1111). However, no sooner had Robert died than the nobles of Apulia and Calabria, always restive under Guiscard, initiated a period of

complete anarchy. Nor was Roger's succession unchallenged by Bohemond. As a result, Roger was very weak, though he was still able, with the assistance of the prince of Capua in 1086, to restore Rome to Pope Victor III (r. 1086-1087). A few years later, Pope Urban II (r. 1088-1099) would lend a hand to Roger Borsa in restoring some order in Apulia. Roger Borsa was also able to count on his uncle, Roger (Guiscard's brother), count of Sicily (d. 1101), to assist him—for a price—in controlling the conflicts in southern Italy. Through clever negotiation, the count of Sicily was able to extort from Roger Borsa many of the strongholds they held in common, a legacy of Robert Guiscard's earlier agreements with his brother. The only other triumph of Roger Borsa was his success in restoring Richard, son of Jordan of Capua (d. 1090), to his paternal inheritance. Roger Borsa died on 22 February 1111; he is buried in the cathedral of Salerno.

Rolandino De' Passaggeri

Rolandino de' Passaggeri (c. 1217-c. 1300) was the son of an inn-keeper and tax collector (*passaggero*). Rolandino matriculated in Bologna's guild of notaries in 1234. As communal notary (by 1238), he recorded council meetings and later composed official correspondence. Between 1245 and 1262, he was notaiy for the bankers' guild and guided the

reform of its statutes. In 1256, he was instrumental in drafting legislation to free the serfs in Bologna's countryside. Rolandino was strongly against the magnates, and by 1278 he controlled the pro-*popolo* Company of the Cross. This 2,000-man force was directed against the noble Lambertazzi faction that had attempted a coup in Bologna in 1274. In December 1279, the Company of the Cross thwarted a second coup, and Rolandino was elected communal rector for the first time. In 1284, he played a major role in the revision of the Bolognese laws, many of which now purposely disadvantaged nobles.

From at least 1281 on, Rolandino taught the notarial arts, and he is best-known for his magisterial *Summa totius artis notariae* (*Summa of the Entire Notarial Art*, 1255-1256). This compendium of customs, laws, terms, cases, and illustrations for notarial training and practice was neither the earliest nor the last of its genre but is the best. (As late as 1627, it was translated for use in Piedmont.) Rolandino was also the author of an important work on wills and inheritance, *Flos ultimum voluntatum*. Rolandino made his own will in 1297 and had died by 1301.

Rolandino of Padua

Rolandino, the great historian of thirteenth-century Padua, was born in

that city early in that century. He was the son of a notary and took up that profession himself, after studying *dictamen* under Boncompagno da Signa in Bologna. Late in life, Rolandino became a professor of grammar and rhetoric at the University of Padua. Like his father before him, he had the habit of recording the significant events of each year. His fellow Paduans thus considered him the natural choice to write the history of the turbulent events involving their city and Ezzelino da Romano, the *signore* of Verona.

Not only did Rolandino profit from being an eyewitness of the principal events he would narrate; he also had the benefit of a model, the *Siege of Ancona* by his master Boncompagno. Rolandino's *Chronicles of the Trevisan March* are broader in scope than his predecessor's work, with regard to both time and geography. The real hero of his story is the entire Paduan people. His intention was to blame no Paduan but to praise the steadfastness of all the citizens. The commune accepted his work and endorsed its condemnation of tyranny and its heroic depiction of Padua. Albertino Mussato would base his own *Ecerinis*, written in the second decade of the fourteenth century, on these *Chronicles* of Rolandino.

Rome

History and Development

The city of Rome was once the capital of an empire. At the end of antiquity, it underwent a revolution in its urban and conceptual identity more complete than that of almost any other European city. After the emperor Constantine the Great (d. 337) had granted toleration to Christians in 313 at Milan, and after the emperor Theodosius (d. 395) had raised Christianity to its position as the state religion of the Roman empire in 380, Christianity finally prevailed in Rome at the end of the fourth century and was even accepted by the powerful senatorial families. A significant factor in this was the defeat of the Symmachus, prefect of the city, when he opposed Ambrose (d. 397), archbishop of Milan, in a dispute over the return of the altar of the goddess Victory to the *curia senatus* (senate house). Christian apologists and theologians such as Eusebius (d. 339), Augustine (d. 430), and Jerome (d. 420) reevaluated the history of the Roman empire as a necessary stage in the history of the church and thereby laid the basis for the myth of Rome. That myth continued to have an effect through the entire Roman Middle Ages and soon developed a life of its own, quite in contrast to the city's actual condition. Specifically, the departure of the emperor to the new capital at Constantinople deprived Rome of its central political importance for the Roman empire as a whole and led to a decline in

trade as well as to problems with the grain supply and the ability of the city to defend herself. Rome was captured and plundered by Alaric and the western Goths in 410 (the damage to the aqueducts being especially serious) and by Gaiseric and the Vandals in 455; this made a great impression on contemporaries, Jerome and Augustine among them, and dealt a severe blow to the ideal concept of Rome in late antiquity.

In 489-493, Theodoric (d. 526), king of the Ostrogoths, conquered Italy, but he lived at Ravenna and made it his capital. Indeed, the king, fearing the senatorial party, which was friendly to Byzantium, remained distrustful of Rome. After the Gothic Wars (536-552), Rome again fell under the rule of the eastern Roman emperor. A few years after the Lombards began their invasions of Italy in 568, only the exarchate of Ravenna and Rome itself were left to the Byzantines, a situation that isolated Rome even more. By the end of the sixth century, the Roman senate no longer met. The popes, who had spiritual authority, gradually stepped into the resulting vacuum of power; for humanitarian motives, they first saw to the grain supply and the repair of the dilapidated aqueducts, but they soon took over wider administrative responsibilities. Among these popes, Gregory I (the Great, r. 590-604) was especially distinguished; he was a descendant of the Roman nobility and was the *praefectus urbis* (prefect or chief administrator of the city) at the time of his election to the papacy by the people and clergy of Rome.

The brilliance of the ancient metropolis, which had a million inhabitants in the third century, yielded with the passage of time to general desolation and a progressive loss of population. Floods damaged the city, and there were outbreaks of pestilence (such as those of 1348, after which the Romans erected the monumental steps of the Franciscan church of Santa Maria in Aracoeli). As a result, during the High and late Middle Ages, the city numbered only 30,000 inhabitants and presented a landscape of ruins. In the High Middle Ages, the Roman forum lost its purpose as a political and commercial center. The Quirinal, Es-quiline, Caelian, and Aventine hills were abandoned, and thereafter the residential areas were concentrated within the large bends of the Tiber and thus extended mainly from the Capitol to Castel Sant'Angelo (Castle of the Holy Angel), formerly the mausoleum of Hadrian. In this process, the districts of Trastevere and Borgo became

more densely populated. This area is referred to as the *abitato* ("inhabited ground"). The remainder of the city within the Aurelian walls was, for the most part, not built on and consisted of fields and meadows; in this *disabitato* ("uninhabited ground") only the great basilicas such as San Giovanni in Laterano and Santa Maria Maggiore stood out. The sites of the temples had long been taken over by churches and cloisters, founded primarily by the popes after the new Constantinian epoch. Among these were some ancient buildings rededicated as churches. Thus the Pantheon was transformed in 609 by Pope Boniface IV (r. 608-615) into the church of Santa Maria ad Martyres (later renamed Santa Maria Rotonda).

The new role of Rome as the seat of the papacy, and thus as the center of Christianity, gave the city a new identity. The ecclesiastical organization of Rome goes back in principle to the first centuries of Christianity. In the Middle Ages, the location of many churches in open land was associated with the decline in population, which separated them from the *abitato*. The so-called *tituli*, chapels in private houses that retained the names of their owners, formed the basis of the ecclesiastical structure of the city until the eleventh century. The deaconries (*diaconiae*) came into being for the support of poor pilgrims and can be traced back to the time of Gregory I. Archaeological discoveries indicate a continuity of use from the granaries of late antiquity. Prominent among the churches of Rome were the "patriarchal churches," especially venerated and sought out by pilgrims. These included the churches that contained the tombs of the apostles Peter and Paul; San Giovanni in Laterano, properly the church of the bishop of Rome, with the seat of the papacy in the Lateran Palace attached to it; Santa Maria Maggiore (Saint Mary Major); Santa Croce in Gerusalemme; and churches (besides the church of Saint Paul) located outside the city walls: San Lorenzo and San Sebastiano. Especially around the churches of Saint Peter, Saint John, and Saint Mary Major lay a ring of cloisters and hospices (*scholae* and *xenodochia*—schools and inns) that were intended, among other purposes, for pilgrims of a particular origin (Greeks, Anglo-Saxons, Franks, Frisians, etc.). The term "basilical monastery" (Ferrari 1957) refers to a monastery that was responsible for the choirs in the more important basilicas of Rome. From the seventh through the ninth centuries, the basilicas of Saint

Peter, Saint John, and Saint Mary Major each acquired four such monasteries. By the eleventh century, these monastic communities were transformed into communities of canons (chapters). From the early twelfth century, the chapter at Saint John Lateran consisted of regular canons who followed the rule of Saint Augustine. Not until the reform of the chapters by Pope Boniface VIII (d. 1303) in 1299 was the chapter at the Lateran opened to secular canons. The ambitions of the clergy from the Roman elite were concentrated on the chapters of these three churches for at least two reasons: first, unlike other episcopal cities, Rome had no cathedral chapter; and second, the Romans played an ever smaller role in the workings of the Roman curia. A symbolic connection between Saint Peter's and the Lateran was established after every papal coronation by the procession of the newly crowned pope from Saint Peter's to Saint John Lateran, where he took personal possession of his bishopric.

All Roman priests belonged at first to the *presbyterium* of the bishop of Rome, the pope. Among them, however, those priests and deacons who took over duties in the principal basilicas gained special importance, and c. 500 they were for the first time called *cardinales*. Later, a distinction would be made between *diaconi cardinales* and *presbyteri cardinales*. In the eighth century, the bishops of the so-called suburban bishoprics around Rome—Albano, Ostia, Palestrina, Sabina, Tusculum—were included as *episcopi cardinales* with the Roman urban clergy. The Roman cardinals, however, were transformed in the eleventh century from a primarily local and city institution into an institution of the church as a whole, in that now foreigners could become cardinals. In the time of Pope Gregory VII (d. 1085), there was a considerable controversy over the rights of this *collegium* in the election of the popes; the controversy persisted until the legal formation of the college of cardinals c. 1100. During the eleventh century, and probably in reaction to the formation of the college of cardinals, the secular clergy of Rome had organized themselves into the *Romana fraternitas*, which had originally, in 984, been the Fraternity of Prayer. Its responsibilities, set down by papal privilege, were centered mainly on church jurisdiction and the control of divine services and processions. Around 1330, Rome had 414 churches and monasteries with 785 secular clergy and 1,018 monks, religious, nuns, and *hospitalarii*.

Because the number of clergy was so large, discipline was by no means perfect. As late as c. 1300, there was still significant church construction and significant production of sacred art and painting, but many churches were in decay at the end of the Middle Ages.

Religious life in Rome, however, was far-ranging. The offerings of the Romans especially benefited the large hospitals— Santo Spirito in Sassia in the Borgo and Sant'Angelo or San Giovanni in Laterano. San Giovanni was under the direction of an influential Roman fraternity, the Fraternity for the Holy Redeemer (*Societas raccomandatorum imaginis Salvatoris nostri ad Sancta Sanctorum*), which was founded probably c. 1300 to honor the image of the redeemer in the church of Saint Lawrence (Sancta Sanctorum) near the Lateran.

Rome. Hartmann Schedel, *Liber cbronicarum* (Nuremberg Chronicle).
Nuremberg: Anton Koberger, 1493, p. 58r.

The civic architecture of the Middle Ages has left few traces. For centuries it had been the custom to draw on the abundant remains of building materials from antiquity (the spoils). Limekilns were used to transform ancient marble into lime. Some ancient monuments such as

Trajan's Column and the statue of Marcus Aurelius at the Lateran (now on the Capitoline), which had been mistaken for an image of the emperor Constantine, received special protection and escaped destruction. Around the mid-eleventh century, the nobility transformed numerous buildings into fortresses—for example, the Colosseum, the theaters of Marcellus and Pompey, and the tomb of Augustus—and erected the family towers typical of medieval cities (in 1257 alone, supposedly 140 of these towers were destroyed). The arena of the stadium of Domitian became a marketplace, while the stands were used for the foundations of adjacent houses. Although as a rule builders made do with what material was available, the extension of the *borgo* around Saint Peter's into a new walled suburb—the *civitas Leoniana* or "Leonine City," named after Pope Leo IV (r. 847-855)—was a rare example of new urban construction in medieval Rome. This project had become necessary because of the Saracen attack on Rome in 846 and, significantly, was under the direction of the popes. The mausoleum of Hadrian was rebuilt as the Castel Sant'Angelo, which protected the most important crossing of the Tiber, the equally ancient Bridge of Angels; other important bridges were those to the Tiber island and the Ponte Emilio (today Ponte Rotto, the "broken bridge"). Via Papalis, also used as a street for processions between Saint Peter's and the Lateran church, was one of the main traffic arteries of medieval Rome. Other important arteries included Via Recta (now Via dei Coronari) and Via Lata (now Via del Corso), leading to the Porta del Popolo, both of which follow the ancient street plan. According to relatively recent studies, wealthy monasteries like San Silvestro in Capite and San Ciriaco played a significant role in the determination of land for development on the perimeter of the *abitato*, in that they donated monastery property for the construction of residential building in return for an annual income. From the ninth through the twelfth centuries, the city was divided into twelve quarters (*rioni*), of which only seven corresponded to the fourteen *regiones* of the Augustan period. Around 1300, the populous Trastevere area on the far bank of the Tiber also gained the status of a *rione*, the thirteenth; however, the Borgo did not become an independent quarter until the sixteenth century.

Rome's attraction as an ideal and as a religious power was not diminished. Roman history in the Middle Ages is replete with

renovationes that always sought a link—however tenuous— to the grandeur of antiquity. The Romans themselves cultivated the memory of their city's former significance, even though its constitution had long since lost any tie to the ancient context. Thus the leaders of the city administration liked to give themselves archaizing titles such as *proconsules Romanorum* and *senatores*. The emperor, the pope, and the Romans seeking their own role (from the thirteenth century on one can refer to them as a city commune) formed a trichotomy that—with occasional interruptions and in differing degrees—determined the city's destiny.

The emperor was certainly the first major power to suffer a loss of significance. However, he did not cease to base his legitimacy on a connection to the ancient Roman empire. In the eighth century, the eastern Roman empire lost most of its control over Rome as the Roman aristocracy undertook the defense of the city on its own. When the Lombards repeatedly attempted to storm Rome, Pope Zacharias (r. 741-752) asked King Pepin III for help and once and for all turned his back on powerless Byzantium. The battles between the Franks and the Lombards continued until 774, when Charlemagne came to Rome for the first time and, supported by his use of the Byzantine rank of *patricius*, established a Frankish protectorate. On Christmas day 800, he received the emperor's crown from the hands of Pope Leo III. In 824, Emperor Lothar I, in the constitution *Romana Lotharii*, established the administration of justice in Rome under both imperial and papal control. Obedience to the pope was required of the Romans, and the election of the pope was reserved to them; but the pope-elect had to swear an oath of allegiance to the emperor before being consecrated. There remained continual turmoil in Rome, but with the popes at its center the city exercised considerable magnetic force as the ideological center of the restored western *imperium Romanum*. Not even the Saxon successors to the Frankish kings could evade this force. Thus, with the coronation of Otto I in 962, there began the series of expeditions to Rome by the German kings, who came there to receive the imperial crown and, as a consequence, allowed the Roman empire to live on (*renovatio imperii Romanorum*). The influence of the Germans in Rome, however, remained on the whole marginal and usually disappeared immediately when they withdrew. The city prefect (*praefectus urbis*)

functioned in the name of the emperor and of the pope as the highest judicial authority, particularly in criminal jurisdiction, for only he could deliver a sentence of death. The city prefect could also appoint notaries and was the protector of public order. From the thirteenth century on, this office was held hereditarily by the Di Vico family, located in the north of Rome. The judicial system was otherwise in the hands of the two panels of judges: the *iudices palatini* and the *iudices dativi*.

Turmoil in the Carolingian empire weakened Rome's ability to defend itself, and the city was plundered by the Saracens in 846. Later, however, the Roman *magister militum et vestiarius, dux et senator* Theophylact (died c. 924)—with the help of Pope John X (r. 914–928) and supported by a coalition of the cities of Campania, the dukes of Spoleto, and the Byzantines in southern Italy—would defeat the Saracens at Garigliano in 915. Theophylact's much-maligned daughter Marozia led his regiment until 932; she was followed by Alberic (d. 954), her son through a marriage with the margrave Alberic of Spoleto. Alberic ruled with the programmatic title *princeps ac senator omnium Roma-norum*. When his son Octavianus became Pope John XII (r. 955–963, d. 964), secular power and ecclesiastical power in Rome were said to be united. John XII invited Otto I to Rome to be crowned, but John was himself deposed because of his intrigues against the emperor. In 963, Otto I granted the Romans a privilege that essentially reiterated the *constitutio Lotharii* of 824. The Ottonians sought to free the papacy from the grip of the Roman aristocrats, who were now headed by the so-called Crescentii. Crescentius I *de Theodora* was probably a grandson of Theophylact on his mother's side. In 974, he brought about the fall of Pope Benedict VI. Benedict had been elected in the preceding year, but through the machinations of his rival, the antipope Boniface VII (d. 985), he was strangled in July in Castel Sant'Angelo, the fortress of the Crescentii. In the end, Crescentius I had to submit to Otto II (r. 973–983). Crescentius II Nomentanus (also known in the historical sources as Johannes Crescentii) created and banished popes at will. Otto III, putting an end to this practice, had his own maternal cousin elevated to the papacy as Gregory V (r. 996–999), beginning a series of foreign popes. Crescentius II was finally held captive in the Castel Sant'Angelo and was cruelly executed in 998. This act of violence exposed the extent of the ambitious renovation plans of the young Otto

III, although he would die in 1002, too soon to realize them; Otto III had wanted to erect his own permanent residence in Rome.

Church of San Lorenzo Fuori le Mura, Rome. Photograph courtesy of Christopher Kleinhenz.

Soon after the death of Otto III, Rome became involved in the strife between the Crescentii and the Tusculans—the lords of Tusculum, a small city in the Alban hills near Rome. Both sides turned to the German king Henry II (r. 1002-1024), who decided in favor of the Tusculans and had himself crowned by Pope Benedict VIII (a member of the Tusculan house). The series of Tusculans under the protection of the German kings from the Salian family came to an end in 1054 with Pope Benedict IX, who had to defend himself against one of the antipopes supported by the Crescentii (Sylvester III). Ironically, only Benedict's resignation, purchased with money, made it possible for a reformer, Johannes Gratianus to become pope (as Gregory VI, r. 1045-1046). The next year, at Sutri, King Henry III (r. 1039-1056) had Gregory VI, Sylvester, and Benedict IX deposed by a synod. The new pope—a German, Clemens II (r. 1046-1047)—crowned Henry on Christmas day of the same year. The next three popes also came from Germany. Their rule, though open to reforms, did not always turn out happily, especially when the arrival of the Normans in southern Italy introduced a new source of unrest. Most of the Roman nobility was

hostile to the reformers, whose most prominent figure was Archdeacon Hildebrand (later Pope Gregory VII, r. 1073-1085); the reformers' demands for freedom in papal elections and their opposition to simony and to the marriage of priests threatened the interests of the nobles. But the reformers received support from the head of the Pierleoni family, Leo, whose father, Benedict, was a Jew, though probably a convert to Christianity. (Throughout the Middle Ages, the Jewish community in Rome had its center in Trastevere.) At the Lateran Council of 1059, Pope Nicholas II (r. 1058-1061) won approval of the *statutum de electione pontificis*, which established that the cardinal bishops (who now came from all over Europe and were favorable to the reforms) would designate the new pope, who then would be approved by the two other orders (priests and deacons). The clergy and people of Rome retained only the legally irrevocable right of acclamation. Because the decree of 1059 concerning papal elections also threatened the prerogatives of the emperor, a party in Rome favorable to the emperor was supported by the empress Agnes, who was regent for her son Henry IV, a minor.

Colosseum, Rome. Photograph courtesy of Christopher Kleinhenz.

When Nicholas II died in 1061, the regent designated Cada-lus, bishop of Parma, as the new pope (the antipope Honorius II), while the reformers elected Anselm, the bishop of Lucca, as Alexander II (d. 1073). Open strife broke out during Christmastime 1075, when the aristocrat Cencio fell on Pope Gregory VII as the pope celebrated mass in Santa Maria Maggiore and hauled him off to one of the Cencio towers. The people, however, freed Gregory immediately. On other occasions, the lower and middle classes were to give proof of their loyalty to the reform movement, but they were united in their

opposition to the city nobility and were inclined to favor the emperor. In 1076-1077, the investiture controversy, a dispute between the popes and the German king Henry IV, reached its first crisis. The mutual excommunication of pope and emperor also must have created a division among the Romans. After a failed siege in 1081, Henry IV was able to take the Leonine City (Borgo) and establish his antipope Clement III (Wibertus of Ravenna) in Saint Peter's, while Gregory was imprisoned in Castel Sant'-Angelo. In 1084, Henry had himself crowned in the Lateran church. Finally, Gregory VII called on the Normans for help; the Normans did conquer the Germans but also wreaked devastation on Rome, recalling the catastrophes of 410 and 455. The areas near the Porta del Popolo and between the Lateran and the Colosseum were especially affected. The people, embittered, turned away from Gregory VII, who was forced to follow the Normans to Salerno, where he died.

Around 1100, the Frangipani (originally of modest circumstances) and the Pierleoni became the most powerful families of Rome, because of their early association with the reform popes. Although together they supported Pope Urban II (r. 1088-1099), rivalry between them soon broke out. Pope Paschal II (r. 1099-1118) was especially close to the Pierleoni. The imperial party was able to count on the abbot Berardo of Farfa and Tolomeo of Tusculum. When Emperor Henry V (r. 1106-1125) stood before the gates of Rome, the Pierleoni headed the deliberations. Paschal, who had been taken prisoner by imperial forces not long before, had the support of the people and was finally able to end the controversy over investiture. But there was no end to unrest in Rome. In 1117, the Frangipani went over to the side of the emperor and to Ptolemy of Tusculum; they prosecuted Gelasius II (d. 1119), who had been elected pope in 1118; and they disturbed the election of Pope Honorius II (d. 1130) in 1124. In 1130, there was again a double papal election; this time, however, the emperor was not a participant, and both contenders were from Roman families. On 14 February, both Gregorio Papareschi (Innocent II, d. 1143) and Pietro Pierleoni (antipope Anacletus II, d. 1138) were elected. Innocent had the support of the Frangipani and the French cardinals, but the majority of the Romans favored Anacletus. Innocent II owed his ultimate victory in no small part to the decisive partisanship of Bernard of Clairvaux (d. 1153).

Amid the turmoil of the first half of the twelfth century, Rome developed the kind of communal self-consciousness that in other cities in central and northern Italy had already led to the establishment of independent communes. In 1143, the Romans stormed the capitol, installed senators there for the first time (*renovatio senatus*), and named the brother of Anacletus II, Giordano Pierleoni, *patricius*. They thus shook off the temporal rule exercised by their bishop. But because he had meanwhile become the head of a worldwide church, he could not remain outside the conflict, especially since Rome, like the other Italian communes, was seeking to have its own *contado* (*districtus*) in Latium. The leaders of the communal movement came mostly from the middle levels of society; they were small landowners, farm owners, merchants, judges, notaries, and artisans. But Rome, unlike other Italian cities, had little economic strength: it was not a large center of trade, and its economic structure was still primarily agrarian.

In 1144, another uprising took place, directed against Giordano Pierleoni, who had been forced out of office, and against the nobility. The young commune found its center on the Capitol, where the palace of the senators was built in 1150. Because the commune had powerful opponents in the pope and his ally, King Roger II of Sicily, as well as in

the Roman nobility, it attempted to draw the German kings—Conrad III and Frederick I Barbarossa—to its side. In letters sent to the commune between 1144 and 1155, these kings developed a political ideology based on the model of antiquity. The commune conceived of itself again as *senatus populusque Romanus* (S.P.Q.R.). After the instability in Rome had endangered the conclave, the commune and the new pope Eugenius III (r. 1145-1153) finally reached a compromise: The commune recognized the pope as supreme sovereign, and the pope in return affirmed the Roman magistrates and was prepared to provide subsidies. In the *renovatio sacri senatus*, the Romans saw hope for a reform of the empire (*restauratio imperii Romani*); they offered Conrad a coronation and invited him to live in Rome as his capital. The chronicler Otto of Freising (d. 1158) assigned responsibility for the antipapal and anticlerical elements in the Roman revolution to Arnold of Brescia (d. 1154), although Arnold did not come to the city until 1145 or 1146. Arnold, who lived as an ascetic, was first and foremost a religious reformer. "But in Rome, protest against the laxity of priesthood and hierarchy inevitably entailed antipapalism" (Benson and Constable 1982). Arnold quickly assumed the archaizing vocabulary of the Romans. In 1152, a disciple of Arnold, Wezel (probably a German), rejected for the first time the Donation of Constantine. In contrast to the Hohenstaufen kings, the Romans took the position of late antiquity that the essential factor in the elevation to emperor was the act of election or acclamation—not the coronation, with its religious embellishments, by the pope. There was no agreement with Frederick Barbarossa on this point, and so his coronation in Rome in 1155 took place amid an uproar, during which the Romans finally forced the withdrawal of the German troops.

In 1188, the commune made an additional agreement with Pope Clement III (r. 1187-1191), a native Roman, extending its authority over coinage. In 1191, the pope and Emperor Henry VI allowed the Romans to destroy their rival, Tusculum. Also in 1191, Benedictus Carus homo took over leadership of the city as sole senator. In the future, there would be only one or two senators. Under Benedictus the commune began to dispatch its own *iustitiiarii* as magistrates to its territory in Latium. Benedictus was driven from office in 1193; there followed a series of short-lived transitional governments.

Under the power-conscious Innocent III (r. 1198—1216) and the popes who succeeded him, conflicts with the Roman commune became more frequent. Some of these, mainly regarding control over the election of the senators, were resolved with force. In addition, the Romans laid claim to territory stretching from grain-rich Tarquinia in the north to Terracina in the south. Their expansionism aroused opposition not only from the popes but from other communes in Latium. In 1199, the inhabitants of Viterbo, 56 miles (90 kilometers) north of Rome, attacked the small castle of Vitorchiano, setting off the first armed conflict between Viterbo and Rome; in 1201, this was settled to Rome's advantage. In the course of the thirteenth and fourteenth centuries, however, there would be further wars with Viterbo and other cities of Latium (Tivoli, Tarquinia, Velletri). These conflicts indicate that communal Rome had a strong sense of identity; they were also economically necessary, for they concerned control over the access roads and the grain-growing lands north of Rome.

The situation in Rome in the years after 1201 was characterized by internal friction between pro- and antipapal factions among the nobility. To understand these conflicts, it is necessary to consider the social changes occurring in Rome at that time. The popes saw that strengthening their own families was a way to check the Roman commune and the enticements that the emperor was making to the Roman nobility. The popes increased the power of their families by making over to them ecclesiastical fiefs in Latium as well as offices in the church. In an electoral monarchy like the papacy, this method of ruling, though in itself lawful, nonetheless raised the problem of how

the relatives of a given pope, after his death, should act toward the nephews of his successor, who were now themselves seeking pride of place in the curia and in Rome. Conflicts here were often unavoidable, and in the coming centuries they affected many a pontifical change. Innocent III and his family finally emerged victorious, and in the following years Innocent named only senators devoted to him. With Honorius III (d. 1227), an exponent of the Roman Capocci family (and not of the Savelli, as has been generally supposed), became pope. In 1222, Matteo Rosso Orsini became senator of Rome for the first time.

Under Pope Gregory IX (r. 1227-1241), who was a distant relative of Innocent III, the Roman commune was once again drawn into the conflicts between pope and emperor, as it had been earlier, in the mid-twelfth century. Frederick II Hohenstaufen had been crowned in Rome in 1220, and the papacy had initially been inclined toward him but had then become alienated. In September 1227, Frederick II was excommunicated and went in search of allies. He first appealed to the traditionally pro-imperial Roman noble families, and in the case of the Frangipani he was successful. He also found adherents among families that had recently risen socially, such as the Conti and the Colonna. In 1234, a virulent conflict between pope and commune broke out, as the senator Luca Savelli demanded free senatorial elections and the right of coinage, calling into question the agreement of 1188 between the Roman senate and Clement III. The pope responded with an excommunication and even mobilized the emperor against Rome; imperial troops attacked northern Latium in support of the pope. In 1235, after the military defeat of the Romans, a new senator (Angelo Malabranca) and the people's assembly submitted completely to papal sovereignty as regards the city. The Romans also had to give up their expansionist policy in Latium and grant to the clergy judicial immunity and freedom from taxation.

From 1236 on, as a result of a dispute with the league of Lombard cities, Frederick II drew the city of Rome into his concept of empire; in repeated declarations, he celebrated Rome as the ideal center of the *imperium Romanum*. In 1236, a revolt by the Frangipani, who were loyal to the emperor, had led to the destruction of their fortress in Rome; afterward, however, the emperor was still able to count on several partisans among the Romans. When, on 27 November 1237, he

won a victory over the Milanese and the Lombards at Cortenuova, he sent the Milanese *carroccio* bearing Milan's standard, the symbol of the free commune, to Rome; there, in 1238, it was ceremoniously installed in the capitol. The leadership of the commune was divided in 1238, and from then on it consisted of one imperial and one papal senator, serving in office simultaneously. When Cardinal Giovanni Colonna—with his nephew Oddone, who was serving as senator with a member of the Annibaldi family— openly took the emperor's side, the situation again became dangerous for the pope. With Matteo Rosso, Pope Gregory won the support of the Orsini, and this led to the first great conflict between the Orsini and Colonna families. Their rivalry would long remain a factor in the political history of the city of Rome; but Gregory's death in August ended the struggle for a time. Matteo Rosso Orsini, ruling as sole senator, compelled the cardinals to hold the first conclave in the history of the church.

The pact through which Orsini, on 12 March 1242, concluded an alliance between Rome and the communes of Perugia and Narni permits insight into the social and constitutional structure of Rome. The pact was confirmed by the oaths of eighty-five *consilarii* of the Roman commune, who are mentioned by name. This document is all the more important because the archive of the commune was destroyed (probably in 1527) and after 1204 there are few sources for the constitutional organs operative for the next 150 years in the Roman commune. Little is known, therefore, about how the city council was elected. Family lines are known for about three-quarters of the eighty-five councilors in 1242. Although three classes in the population are distinguished, it must be kept in mind that the social classes in Rome were always in flux. The upper class of the twelfth, thirteenth, and fourteenth centuries did not, of course, consist of exactly the same families, even though there were families that did maintain their status for an astonishingly long time. In 1242, then, there were among the *consilarii* the exponents of the so-called baronial families being formed at the time: the Annibaldi, Bonaventura-Romani, Capocci, Conti, Malabranca, and Stefaneschi-Raynerii, to which must be added the Orsini, Colonna, Normanni, Savelli, de Sant'Eustachio, and, at the end of the century, the d'Anguillara, Boccamazza, and Caetani. From these circles came most of the sole senators and cosenators who, at the

beginning of the thirteenth century, had dissolved the polycephalous senate. The other aristocrats in Rome distinguished themselves by owning numerous castles in Latium and by having influential representatives in the college of cardinals. The clergy from these families received incomes from sinecures all over Europe, especially from the prebendary benefices in the rich cathedral chapters of France and England.

The majority of the *consilarii* of 1242 came from families who by c. 1250 would already belong to the Roman upper class and who could, in contrast to the baronial nobility with its property mostly in Latium, be called an urban aristocracy: among them Astalli, Boboni, Bulgamini, Cenci (Cinthii), Crescentii, Frangipani, Grassi, Gregori, Ilperini, Judei (Foschi dei Giudei), Lombardi, Magalotti, Mannetti, Mardoni, Pantaleoni, Papa(reschi), Rossi (Rubei), Sordi, and Stati. The families represented here—to which must be added some prominent names like the Pierleoni, Arcioni, and Papazurri—were of varied background. Some sprang from the nobility—for example, the Frangipani, who still owned castles in Latium but no longer belonged to the circle of the barons. Others had risen in the city administration (e.g., as jurists and judges). Still others had been established by the founding fathers of the Roman commune in 1143. Most, however, were commoners who had become rich through commerce and real estate; among these, some can be identified as bankers (*mercatores*). Rome, as the destination of pilgrims and the seat of the curia into which flowed money from all Europe, had become an important financial center. Roman bankers lent money to many prelates and even to monarchs. Not until the second half of the thirteenth century would they be dislodged by Sienese and Florentine bankers. The characteristic activity of the Roman upper class was investment in the agrarian sector and the cattle market, although funds did not begin to flow more abundantly into these until the fourteenth century. In the city militia, this class, accessible from below and socially mobile, formed the cavalry (for which reason the class is called *cavallerocti* in fourteenth-century statutes). Moreover, the families in these circles also traditionally possessed—as we have seen—the most sought-after positions in the church (i.e., the prebendary benefices in the great church chapters in Rome) and could expect, as well, sinecures abroad and high positions in the curia.

Additional names among the *consilarii* of 1242—such as Aldibrandi, Angeleri, Cesarini, Leni, Malaspina, Migliari, and Rogerii—bring us to the milieu of the middle class, the commoners proper. They were often notaries; but artisans, as smaller merchants, property owners, and agricultural merchants, were usually dominant in this class. In Rome, however, true popular organizations like those known in other Italian cities would not form until later.

After the mid-thirteenth century, there were important meetings of the council in the neighboring Franciscan church of Santa Maria in Aracoeli. Later (probably under Brancaleone degli Andalò), the *consilium* was divided into a *consilium generale* and a *consilium speciale*, but for all practical purposes the two bodies met together. The *consilium* increasingly replaced the people's assembly (*parlamentum*), which continued to meet in the capitol only for special occasions. In the communal administration, besides the judges (*iudices*), we should mention especially the magistracies of the *camerarii* (for the administration of finance), the *marescalci* (in charge of the police), and the *magistri aedificiorum urbis* (in charge of construction). The *magistri aedificiorum urbis* concerned themselves especially with keeping the streets free of intrusive additions to buildings, so that, at certain points in the city, the flow of pilgrims would be unobstructed. The financial independence of the Roman commune was a persistent point of contention between the Romans and the popes; nevertheless, the commune had won its own import duties and a district house and salt tax. The salt tax was very significant for the property of the Saini of Ostia. In 1339, under a pair of Orsini-Colonna senators, *gabelle* (taxes) on the Florentine model were introduced; they led to strong protests from the curia, which was anxious to guard its prerogatives.

We must now return to the political events of the mid-thirteenth century. Relations between the Romans and Frederick II remained tense. When Pope Innocent IV (r. 1243-1254), in fear of the emperor, decided to retire to France and maintained a residence abroad for almost eight years, the Roman commune had more room for political maneuvering. The dominance of the baronial nobility in the office of senator, however, increasingly caused displeasure among the middle and urban aristocracy, which in 1252 stormed the capitol and appointed the earl of Casalechio, Brancaleone degli Andalò (originally from

Bologna), the new senator and captain of the people (*capitano del popolo*). The Roman castle-owning nobility was required to supply hostages, who were sent to Bologna to ensure the safety of Brancalone. The pope himself must have felt provoked by the arbitrariness of the people and Brancalone to establish relations with the Sicilian regent of Hohenstaufen blood, Manfred (d. 1266). Brancalone succeeded in passing legislation against magnates and introduced to Rome the council of elders and *boni homines* as well as the office of captain of the people, held by himself, in connection with the people's militia; he thus obtained, for the first time, popular organizations and commissions. Under Brancalone's regime, the Roman guilds first gained a firm organization. The guilds had emerged from the professional organizations (*scholae*) already attested to in the tenth century. In Rome, unlike the rest of Italy, the most distinguished guild was not that of the drapers and bankers but the *communitas boum* (later *ars bobacteriorum*), that is, the guild of the large cattle dealers, whose *consules* came from the leading families.

The fickle populace joined with the nobility in 1255 to put an end to the austere regime of Brancalone but, in opposition to the barons, continued to install captains of the people. In 1257, Brancalone was able to return to Rome, where he took cruel vengeance on those responsible for his fall two years earlier. In 1258, he placed Corneto (Tarquinia), which was important for the grain supply, under the sovereignty of the Roman commune. Soon thereafter, Brancalone died in Rome. He was followed by his uncle, Castellano degli Andalò, whose fall in 1258 ended the rule of the people; the double senate consisting of two nobles was reintroduced. A new element was added to the latent internal antagonisms that kept the city in a state of unrest. Whereas heretofore the lines of conflict had been drawn between the castle-owning baronial nobility and the "people" (including the urban elite not represented among the senators), a division now emerged within the baronial nobility. The precipitous course of events after the death of Frederick II in December 1250, which divided the Italian cities into Guelfs loyal to the pope and Ghibellines loyal to the emperor, did not leave the Roman barons untouched. The Conti, Malabranca, and Savelli could be considered Guelf. Among the Ghibellines from the baronial nobility were the Sant'Eustachio and the Normanni and, from the urban

aristocracy, the Arlotti, the Sordi, and sometimes the Papareschi. Other families, such as the Orsini and the Annibaldi, were divided politically. Thus the descendants of Matteo Rosso Orsini were Guelf, whereas those of his brother Napoleone were disposed to be Ghibelline.

Eventually, Charles I of Anjou conceived of Rome as the ideal base for the conquest of Sicily with which he had been entrusted by Pope Urban IV (r. 1261-1264)—who, like Charles, was French. With Charles's election as senator by the Roman Guelfs, Rome was drawn into the final battle against the last Hohenstaufen, Conradin. Charles ruled most of the time through vicars from French territories. The Ghibelline nobles were forced into exile, but that did not stop their resistance. On 23 May 1265, Charles I made his entrance into Rome; there, on 6 January 1266, he was crowned king of Sicily by five cardinals. In the battles of Benevento (26 February 1266) and Taglia cozzo (28 August 1268), in which Charles defeated Manfred and Conradin, the last Hohenstaufen pretender to the kingdom of Sicily, Roman nobles fell on both sides. Conradin's Roman partisans were led by Henry of Castille (d. 1303), who had become senator in Rome in 1267. After the defeat of Conradin, Charles again took over the office of senator until 1278. It was the Orsini pope Nicholas III (r. 1277-1280) who solemnly confirmed papal sovereignty over Rome and took the office of senator from Anjou. Although Nicholas transferred it to himself, he passed it on *de facto* to vicars from the Roman baronial nobility. This constitutional model was dominant for the next seventy-years. However, after a renewed period of officeholding by the king from 1281 to 1284 under Pope Martin IV (r. 1281-1285), from France, the control of the senatorship increasingly became a cause of discord for the great families. Among these families, who were also prominent in the college of cardinals, the Colonna and the Orsini quickly became leaders of two opposing groups of clients that can be called "parties." The Orsini were known as pro-papal Guelfs, whereas the Colonna family had the reputation of being Ghibellines, loyal to the emperor. In fact, the real issue was power, although ideological differences concerning the position of pope and emperor should not be underestimated. The Colonna came into conflict with the power-conscious pope Boniface VIII (r. 1294-1303), who invoked a crusade against them. Of course, with the proclamation of the first Holy Year in 1300, the pope also wanted to raise his own esteem. The influx

of pilgrims brought the Romans considerable benefit, so that the jubilee was repeated in 1350 and 1390. Several building and restoration projects in Rome are connected to the Holy Year of 1300.

The "Babylonian captivity" of the papacy in Avignon was another factor in these political conflicts. The conflicts climaxed when the German kings came to Rome for their coronation as emperor. This was the case in 1312 with Henry VII of Luxembourg and in 1328 with Lewis of Bavaria (Louis, Ludwig; d. 1347). On both occasions, the emperor received support from the Colonna (who, however, were by no means politically united among themselves), whereas the Orsini and their followers sided with Angevins of Naples. Henry's journey to Rome was preceded by the regime of the Ghibelline Louis of Savoy as senator from 1310 to 1312. The power vacuum in Rome after the departure of Henry VII could not be filled even by King Robert of Naples, who had been installed by the pope as vicar in Rome and ruled through proxies. From 1320 on, the king chose these almost entirely from the Roman baronial nobility—an indication that there were limits to his own rule in Rome.

The power of the barons, however, did not remain unchallenged. For example, there was the so-called populist regime of Giovanni d'Ignano, who in 1305 was (like Brancaloneone degli Andalo) summoned from Bologna as captain of the people. Under this regime there was a new edition of the city statutes, the participants having included *statutarii* from all thirteen city quarters, elected primarily from the upper and middle bourgeois. These statutes (which are preserved only in fragmentary form) affirmed that the baronial families must submit to the communal government, but in a codicil came to the defense of the Colonna family (now returned from exile) against the Caetani.

In 1312, after the withdrawal of Henry VII, Giacomo Arlotti-Stefaneschi became captain of the people. Giacomo was hardly of a simple background; he was a member of the Roman urban aristocracy and was related by marriage to the Orsini family—a fact that suggests the weakness of the popular party. In the ensuing years, the popular party seemed in danger of being ground down between the large noble parties. The baronial nobility knew how to keep the popular party in check; for example, in 1321 Stefano Colonna and Poncello Orsini took upon themselves the official position of "plenipotentiaries and

protectors of the people" (*syndici et defensores populi*). Both were thereby assigned the highest jurisdictional control over the vicars of King Robert. From time to time they themselves fulfilled the duties of senators. In January 1327, both *syndici* were knighted by the people as they were bathed in rosewater by the representatives of the city districts, the *buoni homines*. This is the first mention of the consecration to knighthood with ritual bath by the people, an event that would later serve Cola di Rienzo as a model.

In 1327, the dissatisfaction in Rome with the pope in Avignon exploded beyond party limits. A new popular regime of fifty-two *electi viri* and of the guild consuls drove out both *syndici* and, in a sharply worded letter of 6 June 1327, demanded the return of the pope to Rome. The leaders of the Roman Ghibel-lines, above all Sciarra Colonna, to whom the office of captain of the people had been entrusted, aroused the indignation of the people and used the opportunity to invite Lewis of Bavaria, who had been excommunicated by the pope, for his coronation. On 17 January, Lewis was crowned emperor in Saint Peter's in a ceremony which was probably influenced by the ideas of Mar-silius of Padua (died c. 1343) and during which Sciarra Colonna is said to have placed the crown on Lewis's head. Assemblies of the people accompanied two further clever moves by the new emperor: on 18 April Pope John XXII was deposed, and on 12 April the Franciscan Pietro of Corvaro was elected as Pope Nicholas V by acclamation. This escalation went too far even for many of the popular party. On the day after the emperor left Rome on 4 August, Bertoldo Orsini and Stefano Colonna, as new senators and with the consent of King Robert of Naples, had already begun to reestablish a government of nobles. The popes, strengthened in this way, sought over the next two decades to contribute to the pacification of the city. The rivalry between the Colonna and the Orsini, however, did not allow the city any tranquillity, a fact that hastened its steady economic decline.

Following the events of 1327-1328, the populace did not gain another leader until the advent of the notary Cola di Rienzo, who became a danger to the barons. Cola is first heard of at the close of 1342, when he was dispatched by popular circles to Avignon, although a legation of prominent Romans was already there working for the return of the pope to Rome and for the declaration of 1350 as a Holy Year. Cola, who

was a talented orator, gained the attention of Pope Clement VI (r. 1342-1352), who on 13 April 1344 named him notary of the capitoline chamber. Subsequently, Cola backed the interests of the popular party. The economic importance of that party—and particularly the importance of agrarian entrepreneurs (*bovatieri*)—had increased toward mid-century, partly as a result of forced sales of the property of impoverished churches and nobles, and partly as a result of new reforms in farm management among the large landowners (*casali*) in the countryside around Rome. Cola's speeches in the *assectamentum*, the council of the senators, and in the Lateran Church (on the *Vespasian lex regia*), as well as his propagandistic paintings in the palace of the senators at the capitol and in the church of Sant'Angelo in Pescheria, were intended to attract attention. Cola was already known in the city when, on 19 May 1347, he set himself up for his own downfall and opposed the "tribunes." He was aware that in struggling against the arbitrary power of the barons he would confront not a single social class but a network of clientage that bridged all classes. Cola's own adherents also came from all social classes. He cultivated allies among the baronial nobility, especially the Orsini. Supported by this wide-ranging coalition, he was able on 20 November to deliver a bloody defeat to the Colonna. Cola's ambitious plans, including the recovery of the Romans' ancient ruling rights over Italy and the *imperium Romanum*, and his richly symbolic ceremonies met their end when he lost the support of the papal legate and the pope, who saw his own authority as ruler of Rome threatened. On 15 December, Cola fled under protection of the Orsini to Castel Sant'Angelo and from there to the Abruzzi mountains.

After Cola's fall, the government was again led by a pair of senators from the Orsini and Colonna families and their respective clients. Their rule was interrupted, however, in 1352 and 1353-1354 by short-lived popular regimes under the leadership of Giovanni Cerroni, who belonged to an upper-class Roman family, and the notary Francesco Baroncelli and the noble Guido Patrizi dell'Isola, both former friends of Cola di Rienzo. Finally, in August 1354, Cola di Rienzo, who was imprisoned in Avignon, received another chance, but on 8 October 1354 he was murdered by a Roman mob, spurred on by the Colonna family. The inglorious coronation of Charles IV in 1355, on the other hand, no

longer provoked the internal unrest that had broken out during the coronations of his predecessors even while they were still present in Rome. The popular *interregna* mentioned above received papal approval and the backing of the cardinal legate Aegidius Albornoz (who was cardinal from 1350 to 1367), to whom the pope had entrusted the reconquest of the papal states. Pope Innocent VI (r. 1352-1362) was annoyed with the escapades of the Roman baronial nobility and often favored the popular party. In 1358, the barons installed a senator for the last time; thereafter the pope drew senators from abroad (among them should be mentioned Raimondo Tolomei from Siena, Hugo of Lusignano, and Bindo Bardi from Florence). Also in 1358, one encounters for the first time the seven *reformatores rei publice*, the title of their magistracy alluding to the planned constitutional changes. They, with the approval of the cardinal-legate, formed the real government in Rome. Perhaps as early as 1258–1259, the Società dei Balestrieri e dei Pavesati was founded. This was a militia consisting of crossbowmen (*balestrieri*) and bearers of the long shield (*pavesati*); as a kind of police force, it was supposed to protect the popular regime in the district and in the city. Each of the two units, 1,500 men strong, was preceded by a flag bearer (*bandarese*), flanked by two leaders (*anteposti*). The new statutes, dated in recent scholarly literature to 1360, formally excluded the Roman barons from the city government and prohibited the Romans from serving as their vassals and bearing arms for them. The following years were characterized by collaboration, but also by dualism, between the Roman commune and the papacy that began to take hold in Rome. The commune profited from the investments in its capital made by popes Urban V (r. 1362-1370) and Gregory XI (r. 1370-1378); but when the question again arose how far the commune might pursue its interests within its own district, there was discord and conflict with the administration of the papal state. From 1367 to 1370, Urban V brought the curia back to Rome, or rather to Latium. It is significant that he took up residence in the restored Vatican Palace next to Saint Peter's rather than in the Lateran Palace next to Rome's real episcopal church, San Giovanni in Laterano. Under his rule, the seven *reformatores* were made distinct from the three *conservatores ca-mere urbis*, who were in charge of public finance. The new administrators came from the old city aristocracy and from

families that had recently become prominent. With the permanent return to Rome of Gregory XI at the beginning of 1377, an era of church history and Roman city history came to an end.

However, new trouble lay ahead when Gregory died on 27 March. The election of his successor, Urban VI, from Naples, on 8 April proceeded amid tumultuous circumstances, with the Roman masses loudly demanding a Roman, or at least an Italian, as pope—something the continued presence of the curia in Rome should have guaranteed. The hostility of the Romans toward the French cardinals finally gave the latter a reason to move toward the election of Clement VII as antipope on 20 September 1378. Urban VI and his successors, Boniface IX (r. 1389-1404) and Innocent VII (r. 1404-1406)—all three of whom were Neapolitans—increasingly suppressed the independence of the Roman commune. The financial distress of the popes became so acute that they did not shrink from exacting war contributions from the churches, a measure that further diminished their well-being. The Holy Year of 1390, which had itself been declared for financial reasons, revealed to pilgrims the full extent of the decay and neglect in Rome. The end of the free Roman commune is generally dated to 1398, when Boniface IX, recognized as supreme sovereign, received absolute freedom to choose senators and magistrates.

After the success in Rome of the popes of the Council of Pisa—antipopes Alexander V (r. 1409-1410) and John XXIII (1410-1415)—Martin VI (r. 1417-1431), who was also from the Roman baronial nobility, was recognized as pope. Under the Renaissance popes who were not from Rome, the city enjoyed an economic and cultural upswing, but the Roman communal and urban elements declined in significance because of the influx of foreign members of the curia and papal nephews.

Cultural Development

In 524, when Theodoric executed the philosopher Boethius, in whose career and philosophical work the cultural tradition of late antiquity experienced another triumph, people said that the last Roman had died. The *Dialogues* of Gregory the Great are filled with miracles and, despite

their cultivated Latin, already reveal the distance from the educational resources of antiquity. Still, the popes did much for the educational institutions (especially for the *schola cantorum* and the law school of the Lateran). Because of the decline of Rome in the early Middle Ages, the city lost, successively to Byzantium, Ravenna, Bologna, and Paris, the position as an educational center that it had possessed in late antiquity. If Rome was nevertheless seen as a cultural center, it was above all thanks to the popes and to the Frankish and German emperors—only temporarily dwelling within the city walls—who attracted leading men of learning to their courts. This idea of Rome was quickly promoted by such non-Romans as the Lombard Paul the Deacon (d. 799) in his *Historia romana*. One after another, the schools discontinued their activity, although especially at the Lateran, the seat of the papacy, there would for a long time still be education for the clergy and the growing papal administration. There may have also arisen a papal library at the Lateran, but since the first catalog of the books of the papal library is known only from the year 1295, little can be said about its holdings. Otherwise, the protectors of valuable manuscripts were the monasteries and the writing schools (*scriptoria*) that were formed in some of them, at least in the Carolingian and Ottonian periods. From the seventh to the tenth centuries those monasteries especially stood out those whose monks had come to Rome from the Greek-speaking eastern regions of the Byzantine empire when their homeland was threatened or conquered by the Persians and Arabs. From 678 to 751, there was a long series of popes from Greece, the near east, and Sicily, whereas afterward most came from Rome. However, the literary output of the Greek hagiographers working in Rome is of rather mediocre quality. The Greek language was cultivated through the influence of the Theophylact family, which was interested in ties to Byzantium. At the end of the tenth century, the decline of the Greek monasteries could no longer be prevented. Most fell into the hands of Latinists, and their monks were replaced by canons.

Although the presence of the Carolingians in Rome was not strong, they did see to the revival of the *schola cantorum*, which had fallen into decay, and to the schools that taught law and rhetoric. With regard to paleography, in the vicinity of Rome as far as Umbria a kind of Carolingian minuscule had spread that can be characterized as "Roman-

Romanesca" and can be found from the second half of the tenth century to the mid-twelfth century. Its origin is probably to be sought in the *scriptorium* of the monastery of Farfa, near Rome, which had been founded c. 700 and was closely connected with the Carolingian Anastasius Bibliothecarius (Anastasius the Librarian), who was probably educated by Greek monks in Rome, took part in the eighth ecumenical council in Constantinople in 869 and translated its *acta*. He also translated Greek lives of saints and theological works and was a champion of Roman primacy. Furthermore, he made contributions to *Liber pontificalis*, which was edited or expanded by a succession of authors (increasingly from abroad). After 870, *Liber pontificalis* breaks off, not to be continued until the time of Pope Gregory VII.

Ecclesiastical abuses and the sometimes scandalous events surrounding the papacy during the ninth and tenth centuries nourished a literary genre of "criticism of Rome." Such criticism, which would continue to develop during the following centuries, focused on the papacy and especially on the greed of the curia. Pope Formosus (r. 891-896) was condemned as a heretic by his successor, Stephen VII, who was then himself murdered in 897; Formosus was tried posthumously in the "synod of the corpse," an episode that damaged not only the prestige of the papacy but also that of the city of Rome and its residents. Evidence of this damage is found in the anonymous *Invectiva in Romam*. It was also bruited about in the west that Rome was dangerous for pilgrims and that there was trafficking in false relics. There were, however, moments of light in the so-called *saeculum obscurum*. The *princeps* Alberic called Oddo of Cluny (d. 942) to Rome to reform several monasteries (including San Lorenzo and Sant'-Agnese) on the model of Cluny. Alberic himself founded the monastery of Santa Maria on the Aventine.

The Ortonian period brought positive impulses. Bishop Adalbert of Prague (who would be murdered in 997 by the Prussians) entered the Greek and Latin community of the monks of Santi Bonifazio e Alessio on the Aventine. After having returned for a while to his episcopal see, he came to Rome again with Otto III in 994-995. Adalbert's biographer, Johannes Canaparius (d. 1004), came from Rome; late in life he became a monk and finally, in 1002, abbot of Santi Bonifazio e Alessio. His *Life* was commissioned by Otto III and offers insight into the education of a

rich Roman layman.

Along with the schools of the Lateran, which produced later popes and upper clergy, the cloisters, especially in the eleventh century, became centers for the growth and cultivation of classical literature. With the support of Count Gregory of Tusculum, Saint Nilus of Rossano founded the cloister of Grottaferrata about 12 miles (20 kilometers) south of Rome. Like Nilus, his monks also came from Greek-speaking southern Italy. A *scriptorium* flourished at Grottaferrata.

The young Hildebrand received his education not only at the Lateran but also in a circle, devoted to classical studies, around Johannes Gratianus and Laurentius of Amalfi (d. 1049) in San Giovanni a Porta Latina, where Johannes was archpriest. Laurentius was at first a monk at Monte Cassino and later archbishop of Amalfi; he compiled a florilegium with texts on grammar, rhetoric, poetry, dialectic, music, and arithmetic. Elsewhere, the period of the Gregorian reform and the investiture controversy brought forth a literature of learned polemic, but little evidence remains of this genre in Rome. The *Annates romani* presented the viewpoints of a group of pro-imperial laymen in Rome who arose at the time of Henry IV. Much more important, however, was the contribution of the abbey at Monte Cassino, which had, since 1058 at the latest, its own colony in Rome in the monastery of Santa Maria in Pallara (in the vicinity of the arch of Titus). The old imperial abbey at Farfa was prominent in representing the side of the emperor. Rome itself hardly participated in the flourishing study of Roman and canon law that began in the eleventh century. Significantly, Cardinal Deusdedit (d. 1098 or 1099) was not from Rome but from Aquitaine; yet it was he who compiled a collection of canons of primarily Roman character, using the *Ordines Romani* and the papal archives. The papal mandates themselves created new laws from the twelfth century on, as *decreta* and *constitutiones*. The papal chancellor Aimeric (in office from 1123 to 1141) finally established ties to the law school of Bologna. To what extent such exchanges benefited law in the city of Rome has not been thoroughly studied. Also, how much, if at all, Roman law continued to be cultivated and practiced in Rome is a matter of controversy among specialists.

The turmoil of the eleventh and twelfth centuries, particularly the

plundering of Rome by the Normans, was probably (though not certainly, owing to a paucity of sources) the reason for the destruction and dispersal of the libraries in the large Roman basilicas and monasteries. Whether these institutions then possessed their own writing schools (*scriptoria*) remains unclear. But, significantly, *scriptoria* are attested to for smaller cloisters and clerical communities such as Sand Andrea e Gregorio al Celio (the present-day San Gregorio Magno) and Santa Maria in Tras-tevere, which were closely connected to the reforms of the tenth and eleventh centuries (the reform of Cluny; the reform of the *vita comunis* of the secular clergy). The schism of 1130-1138 confirmed the criticisms aimed against the Roman curia and the city of Rome. Only Peter the Deacon (1107 or 1110-after 1159), who was probably from a Tusculum family and in 1131 was the archivist and librarian of Monte Cassino, emerges in Rome as a literary figure. Peter continued the *Chronica monaste-rii Casinensis* of Leo of Ostia, falsified numerous works, and showed an uncommon interest in antiquity.

Not until the time of the revolutions of 1143-1144 may one speak of medieval "Roman" literature as such; this was the period when the young Roman commune sought with enthusiasm to build its program on the greatness of the ancient city. For the first time, the preservation of ancient monuments, such as the city walls and the column of Trajan, became a public program. Such monuments, through myths and legends, had long been associated with the people's conscious intention of making a connection between the pagan past and Christian Rome. *Mirabilia urbis Romae* had its earliest edition probably by the time of Benedict, the canon of Saint Peter's from c. 1140 to 1143. This Benedict was also the author of *Ordo Romanus*, a kind of manual of the ceremonies and administration of the curia, which since mid-century had been enlarged by the addition of other texts from the city of Rome to form the *Liberpoliticus*. *Mirabilia urbis Romae* describes the walls, city gates, bridges, baths, temples, and theaters of ancient Rome and several of the monuments. Benedict's sources are ancient descriptions of the *regiones* of Rome, lives of the martyrs, the *Fasti* of Ovid, and *Liber ponti-ficalis*. Around 1155, *Mirabilia urbis Romae* was attached to *Grapia aureae urbis Romae*, together with two other works: a short history of the region of Rome, from Noah to Romulus; and the anonymous treatise *Libellus de cerimoniis aule impera-toris*, drawn up

by a Roman layman (perhaps a judge) before 1050. *Mirabilia urbis Romae*, like *Graphia aureae urbis Romae*, was translated in the thirteenth century into the Roman vernacular (*romanesco*). *Mirabilia urbis Romae* became the basis for all guidebooks to Rome until the end of the Middle Ages. Moreover, c. 1200 it was the model for the text, perhaps of an Englishman, *De mirabilibus urbis Romae*, in which the observation of antiquity follows very precise aesthetic criteria. Also to be mentioned are the descriptions by two canons, Petrus Mallius and Johannes, of their basilicas—respectively, Saint Peter and San Giovanni in Laterano. They had been encouraged in this undertaking by Pope Alexander III (r. 1159-1181).

The presence of the papacy in Rome attracted scholars from all over the world, especially when Innocent IV, during the Council of Lyon of 1244-1245, founded a separate *studium curiae* for theological and legal studies, which changed its location in tandem with that of the curia. Thus in 1261 no less a scholar than Thomas Aquinas was teaching in Rome. The scholars and men of letters at the papal court could be found in the monasteries' libraries of Rome, even though many of these were generally neglected and had been decimated during the turmoil of the preceding centuries. Thus Rome's reputation in the world was enhanced once more by the glory of ages past. It is significant that Paravicini Bagliani calls the circle of scholars at the curia the *circolo di Viterbo* after the city in Latium that was for many years the site of the curia's retreats. In the curia, however, the cultural leaders were by no means only Roman cardinals and their *familiae*. The greatest patrons were from outside the city; they included the powerful Fieschi family from Genoa, which in the thirteenth century produced two popes (Innocent IV and Hadrian V) and two cardinals. Among the members of the cosmopolitan curia was also the papal scribe, Saba Malaspina (d. 1297 or 1298), who wrote the history of the rulers of Sicily during his time (1250-1285) from the Roman and curial point of view, devoting considerable space to events in Rome. The fact that his work, completed in 1285, was not really a city chronicle is a reminder that until then Rome had no chronicle tradition independent of the curia, although chronicles were flourishing in other cities. For this reason, there was still little cultural self-awareness in Rome. It was foreign chroniclers (e.g., in the thirteenth century, the English Benedictine Matthew Paris

and Richard of San Germano, in the service of Frederick II) who took an interest in Roman events because of their general political significance. Also active in the milieu of the curia was the great scholastic thinker Aegidius Romanus (Giles of Rome, d. 1316), who—contrary to general opinion—was no exponent of the Colonna family. Another figure was Cardinal Jacopo Stefaneschi (d. 1343), who was a member of the Roman baronial nobility and was educated in Paris. His three-volume *Opus metricum*, completed in 1315, gives an eyewitness account of events from the death of Nicholas IV to the end of the papacy of Clement V (1292–1314).

Not much is known about the educational institutions open to those not of the curia. From the twelfth century on, in any case, the Roman baronial nobles sent their sons to Bologna and Paris to study. In 1265, Charles of Anjou, as Roman senator, held out the prospect of founding a university. On 20 April 1303, Pope Boniface VIII founded the *studium urbis*, a city university independent of the curia; this may not have been welcomed by the not-so-wealthy upper and middle classes. Oversight and administration of the university as well as the appointment of teachers lay with the rectors of the *Romana fraternitas* and the papal vicar *in spiritualibus*. Unfortunately, little is known about the instructional activities of the *studium urbis*. From the circumstances surrounding a faculty position in 1319 we may infer that the university was located in Trastevere and that it played no significant role in the education of the clergy or even the ranks of notaries and jurists in Rome. Those who could continued to send their sons to the recognized great universities of Italy and France.

The general cultural decline in Rome grew worse during the residence of the popes in France after 1305. Early humanistic studies found fertile soil in Avignon. There, however, it was the circle of cardinals Colonna and Orsini from Rome that offered incentives for the new interests. Thus ancient Rome and classical literature stand at the center of the works of Petrarch (Francesco Petrarca, 1304–1374), who was a client of the Colonna and in 1341, under their patronage, was crowned poet laureate in Rome. It is indicative of the cultural milieu in Rome that Petrarch took his exam as *poeta* not at, say, the *studium urbis* in Rome but rather before King Robert in Naples. The coronation itself was performed at the capitol by the king's regent, Senator Orso

dell'Anguillara, son-in-law of Stefano Colonna. In his letters, Petrarch did not close his eyes to the decay of Rome. His complaint about this general decline was joined to criticism of the Avignonese popes, whom he admonished to return to Rome, their ancient seat. Three Romans associated with Petrarch's circle, directly or indirectly, were prominent authors: Landolfo Colonna (died c. 1331) and his nephew Giovanni (d. 1343 or 1344), as well as Giovanni Cavallini (died c. 1348) of the Cerroni family. Landolfo wrote mostly chronicles; Giovanni Cavallini wrote *Polistoria*, a topographical-encyclopedia description of the city. All three authors, despite their knowledge of the classics and their contacts with the Avignonese curia, followed traditional models (in the case of Cerroni, especially the *Mirabilia*); this implies that there was little impetus from Rome itself to pursue the new cultural currents. Only Cola di Rienzo stands in contrast: he was familiar with classical writings and knew how to draw his enthusiasm for Rome into his everyday political actions. He read ancient authors and inscriptions, and his knowledge and interpretations made a deep impression on his contemporaries, as the *Cronica* of the "Anonimo Romano" attests.

The chronicle of the Anonimo Romano, compiled in the Roman vernacular (*romanesco*), but not fully preserved, is unique in the medieval literature of Rome. It is the first chronicle by a Roman, who, without departing entirely from traditional narrative patterns, places the history of Rome at the center of his account. Writings in the vernacular were circulating in Rome from the thirteenth century on, and finally *Liber historiarum Romanorum* was translated under the title *Storie de Troia et de Roma*. Despite recent attempts to determine its authorship, there is no agreement about this. Some of the autobiographical details, however, suggest that the author was a doctor, and in describing his times he takes particular interest in the physical appearance of the protagonists. The cultural impulses that Rome could expect from the return of the popes from the "Babylonian captivity" once again disappeared as the Great Schism developed. Not until the schism ended and the Roman pope Martin V was elected in 1417 were the conditions created for the arrival of humanism and the Renaissance at Rome.
